

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

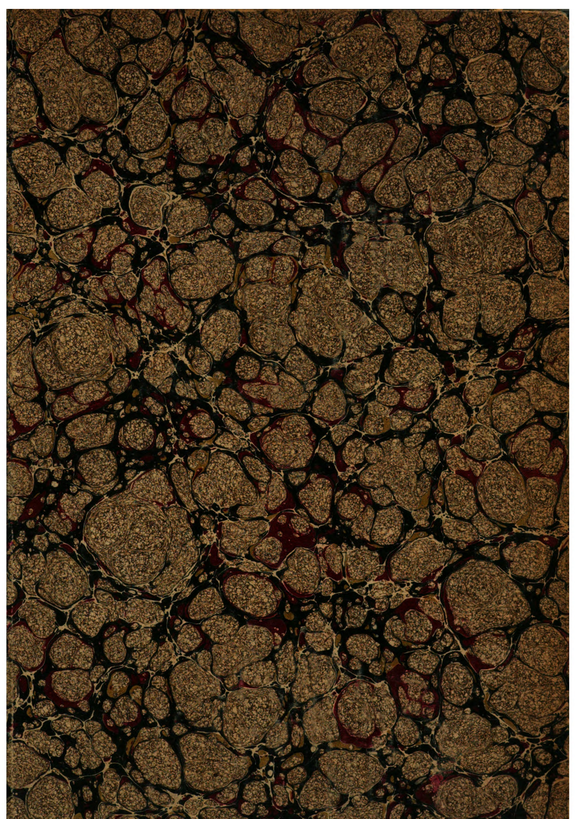
Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.



+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

STUDEBAKER AUTOMOBILES

A new electric vehicle showing radical departures in many essential features. The battery consists of 24 cells, carried in the rear of the body compartment. The motor is rigidly suspended from the frame of the gear, just in front of the battery. The battery will give a run of forty miles on one charge, and can be recharged from any 110 volts direct current lighting circuit. In the severe test made during the last year, no breaks have occurred in running gear. It is a vehicle made for everyday use on country roads and city streets.

OVERFLOW PROVIDED FOR

Restaurant and Possibly Basement to be Used for Show Purposes—Additional Exhibitors.

With the Automobile Show at Madison Square Garden, this city, three and one-half months distant, and the application lists opened less than one month ago, the rush for room has been so great that all the space has been contracted for except four accessory stands in the gallery.

After strenuous reckoning the management of the Madison Square Garden has arranged to care for the overflow of applicants for space. As was intimated last week, it has been decided to convert the restaurant into an exhibition hall; and as, despite the additional space obtained thereby, the demand still continues, the management is now figuring on bringing the basement into use for display purposes. An architect is at work drawing plans for spaces in the basement, which will be decorated and amply lighted.

A representative as well as an enormous show is thus assured, one that will be in every way worthy of the industry and of the interest taken in it by the public.

It is stated by the management that no motor bicycles will be permitted on exhibition. Automobiles and parts and accessories exclusively will be shown, the ground being taken that this is an automobile show, pure and simple. The additions to the list since last week are as follows:

Grout Bros., Orange Mass.
Conrad Motor Carriage Co., Buffalo, N. Y.
Haynes-Apperson Co., Kokomo, Ind.
Electric Vehicle Co., Hartford, Conn.
Automobile Co. of America., Jersey City, N. J.

International Automobile and Vehicle Tire Co., New York.
Weston-Mott Co., Utica, N. Y.
C. F. Splitdorf, New York.
National Carbon Co., Cleveland, O.

German-American Bankruptcy.

Little surprise will be occasioned by the announcement that a petition in involuntary bankruptcy has been filed against the German-American Automobile Co., of Nos. 134 to 150 West 143d street, by the following creditors: James Macnaughton, $1,708 for four months' salary as general manager at $5,000 a year; John L. Schultz, $425, for two months' salary as superintendent of the factory at $3,000 a year, and Bain & Law, $64, for materials.

It is alleged that the company is insolvent, and has paid money and turned over funds and assets to certain creditors to prefer them. The company was incorporated on January 22, 1902, with a capital stock of $50,000; W. N. Beach became president and Thomas H. Gillespie treasurer. Morris J. Hirsch is the attorney for the petitioning creditors.

The concern was really little more than a name, as far as its influence in the trade was concerned. The appearance of its first vehicle was almost contemporaneous with the news of the failure. It operated a small factory in 143d street, this city.

Declares Provisional Dividend.

Creditors of the Steam Vehicle Co. of America, Reading, Pa., will be interested to learn that a dividend has been declared by C. H. Ruhl, referee in bankruptcy. The dividend, which amounts to .30164—just over 30 cents on the dollar—will be paid at the office of Referee Ruhl, 534 Washington street, Reading, Pa., on Saturday, October 11, "unless exception be filed thereto," as Mr. Ruhl cautiously adds.

WINTON AND CANNON

Were the Features of Providence Meet—Former Made Several New Records.

As was the case a year ago, the spectacular features of the race meet of the Rhode Island Automobile Club at Narragansett Park, R. I., on September 24, were furnished by the contests against Father Time. In place of Fournier and his Mors, Alexander Winton and his "Bullet" upheld the gasolene banner, while George C. Cannon in his special built flyer performed a similar service for the steam adherents. Without these two stars the races would have fallen rather flat.

When 2 o'clock came the stands of the famous old inclosure were fairly well filled with a representative and brilliant crowd of spectators. Headed by Governor Kimball and his staff, many of Providence's "best people" braved the rather threatening weather in their desire to witness another afternoon of automobile racing. With them were automobilists from the city and surrounding country, Boston and New York both having good sized delegations present. Men who knew little or nothing about automobiles, but whose love for sport of any kind was the magnet that drew them to the scene, completed the gathering. In all there were nearly 5,000 people there.

Both sides of the fence inclosing the track were filled for a considerable distance on each side of the wire. Inside of it more than a hundred automobiles were lined up, in close proximity to a good showing of horse drawn vehicles.

The racing itself was marred by two features which have been disagreeably prevalent at nearly all automobile meets. Reference is had to the paucity of entrants and starters and to the lack of real contests between closely matched cars. In these particulars the Rhode Island meet was a little better off than the Brighton Beach affair, for example, but the improvement was not marked. Processions and close approaches to walkovers were much more numerous than was desir-

NOTHING TOO STEEP

Latest European Hill Climbing Successes Were up a Mountain Side.

French Bureau Motor World,
2 Rue d'Abbeville.

Paris, Sept, 19.—Who would have imagined less than two years ago that an automobile would climb in 27 minutes one of the steepest gradients in Europe, having a length of 13.6 miles and an average incline of 8 per cent, with a maximum rise for a thousand yards of 13 per cent? When these tests were first organized on kilometre gradients it was considered very doubtful whether any large proportion of the cars would be able to reach the top without the motor getting hot and seizing. The engines have to develop their maximum power without a moment's pause and this, too, at a time when the relatively low speed of the vehicles diminishes the cooling efficiency of the radiators. And yet despite the severe character of the tests the motors made light work of the hills. There were few instances of failures among the scores of competing cars, and finding that nothing around Paris would test the efficiency of the motors it was found necessary to go elsewhere. The Automobile Club of Salon accordingly included a hill climbing test in their programme of events which was decided this week down South, and the cars had to race up the straight and steep road of Mont Ventoux, one of the big mountains of the Alps, rising to a height of something like 5,500 feet.

ONLY ONE FAILED.

There were sixteen vehicles and motor cycles competing in the climb, and of these only one failed to get to the top through a derangement to one of the valves. M. P. Chauchard, on his 70 horsepower Panhard did a remarkable performance by racing up the thirteen miles of mountain road in 27:17, beating Junavon on a Rochet-Schneider, by four and one-half minutes. The performance of the Rochet-Schneider was quite as meritorious as that of the Panhard, for the vehicle was really a light carriage, and failing to get within the limit of weight by a few pounds it had to start with the big vehicles. Its power was probably not much more than a third of the Panhard. The Rochet-Schneiders are manufactured by a firm of that name in Lyons who for years have been turning out automobiles of different types, changed and modified according to the results of long experience, and the new vehicles which have been doing so well in the events in which they have taken part are an almost exact imitation of the Mercedes. Another type of car which has borrowed a good deal from the famous German car is the Turcat-Méry constructed in Marseilles and also built under license by De Dietrich, of Lunéville. Two of these cars competed, one getting to the top of Mont Ventoux in 35 minutes and the other in 39 minutes, while a new make of car by A. Richard took more than two hours. All the other events were carried off by Clément who won in the light carriage class in 33:19, beating a Darracq by 2½ minutes, and he also did best among the voiturettes in 43:35, while he carried off the motocycle events, making in all five first places. It is rare that a single firm carries off such a series of victories, but it is true that in two events Clément had no one to compete against him. Now that Mont Ventoux has been vanquished so easily it is difficult to find any other accessible mountain which is likely to prove too much for the conquering automobile.

STRONG WINDS AND INCIDENTS.

Another event organized by the Automobile Club de Salon was a race between Salon and Arles where there is a 23 mile stretch of magnificent road, and as the vehicles went over the course four times they covered a total distance of 92 miles. Though the weather was fine, the very strong wind that was blowing entirely destroyed any hopes of record speeds being attained, and the incidents on the road were moreover pretty numerous, the first being the trouble Chauchard had with a valve which considerably reduced his time on the first two rounds. On remedying this defect he did the next two rounds at the rate of sixty miles an hour and covered the full distance in 1:35:13. The Peugeot, driven by Renaux, was going remarkably well until it had to withdraw through the pump failing to work. The next in the big carriage class was a Turcat-Méry, which took 1:57:49. Among the light carriages the Darracq of Hemery won in 1:47:17, beating the Panhard of Gondoin by a few seconds, and another Darracq would probably have been at the top, or very near it, had it not been for a punctured tire on the first round. The Clément of Oury won in the voiturette class in 1:56:38, beating a Passy-Thellier by five minutes.

DIFFICULTIES IN WEIGHT LIMITATIONS.

In preparing cars for these races makers find such a difficulty in keeping the weights within the limit prescribed by the regulations that it is being suggested whether it would not be desirable to modify the rules so as to give them more latitude and enable them to present vehicles in a more complete form than is usual in the case of light carriages and voiturettes. In building racing vehicles the manufacturer of course pays more attention to his underframe and machinery, and having got this down to a weight limit consistent with safety he cuts away superfluous weight from the carriage body, with the result that the majority of racing light carriages and voiturettes have no body at all. The frame is simply boarded over and on this is placed a seat for the driver, while the mechanic hangs on as well as he can. The objections against this are twofold; first, because such a flimsy superstructure is liable to give way under shock or strain, as was the case in the Paris-Vienna race when one driver actually had his life saved through the seat breaking away as the vehicle was on the point of rolling over a precipice, and secondly, the appearance of these skeleton vehicles is not calculated to give the public a favorable impression of the esthetic side of the automobile. If racing is to do any good the vehicles must not only prove themselves to be fast and durable, but attractive as well, and if ugliness is to be the characteristic of the racing vehicle it is to be feared that the carriages built for speed tests will not do much to popularize the motor vehicle.

NEW RULES POSSIBLE.

Of course when the weight regulations were first adopted there was no suggestion that makers would sacrifice everything to their underframes and propelling machinery, and it is naturally impossible to prevent them from doing so because there is no means of saying what the maker must put on his frame unless he is required to fully equip it as a touring car, which would probably be carrying the desire for appearances a little too far. In order to overcome this difficulty it is suggested either that the weight limit of light carriages and voiturettes should be raised or that the frames and machinery should be weighed without the carriage body, and it is this latter alternative which will shortly be brought to the consideration of the Automobile Club. If the frame and machinery are alone weighed the maker will be able to fit carriage bodies which will give to his cars a more complete and attractive appearance, at the same time that it will be much safer for the drivers themselves whose lives will not depend, as they do at present, on the security of a couple of bolts. There is much to be said in favor of this reform but it is nevertheless likely to give rise to a good many side issues, not the least of them being the claim of makers of big vehicles to receive the same treatment, which will be equivalent to an all-round raising of the weight limit. The reform also means greater facilities for increasing powers, and whether this is desirable or not is another question.

DE DION'S LATEST MOVE.

The low priced popular car is beginning to insinuate its way into the market. All sorts of makers have been bringing out light vehicles of one type or another at a low figure in the hope of their being taken up by that large class of buyers who are in want of a "cheap automobile," but so far none of them have had much success, and now another effort is being made to fill the requirements by De Dion Bouton et Cie, who are producing a new type of six horsepower vehicle, capable of carrying four persons, which will be sold, I believe, at something like $700. De Dion et Bouton are, of course, the one firm who are able to turn out such a type of car. Their big plant enables them to produce very economically, and as the cars are of very simple construc-

Digitized by Google

tion there are no costly processes in their manufacture. The firm have got a keen eye to the requirements of the public. Having produced low priced vehicles they are arranging, or rather they have already arranged, to have depots in all parts of the country where exchange pieces can be obtained at once wherever the automobilist may be, and as every part of the vehicle is made to gauge there is no difficulty in the owner or any country repairer doing what is necessary to the car.

Trouble With a Fine.

How easy it is to impose fines and how difficult to remit them even when those responsible for them become convinced that they erred was shown in Buffalo recently. A wrangle arose in the City Council regarding the proposition to remit the fines of $15 each imposed on George Bund and John J. Johnson, who were arrested a few weeks ago for scorching with automobiles.

A petition was presented to the Common Council asking that the fines be remitted, as the alleged offenders were engaged in testing an automobile for the E. R. Thomas Motor Co. at the time of their arrest, and, according to their story, were operating the machine on a thoroughfare where there were no other vehicles.

Justice Murphy, who imposed the fines, indorsed the petition, and the aldermen passed a resolution remitting the fines. When the matter reached the councilmen last week it was laid on the table, and Councilman Ash said that he had investigated and was convinced that the fines should not be remitted. Councilman Ladd thought otherwise, and so did Alderman Maischoss, who appeared before the board to speak for the petitioners. Various compromises were suggested and voted down, and finally the matter was laid on the table for another week.

Overreached and Underspeeded.

It is a satisfaction to know that at least one too zealous law making body has overreached itself. Under an ordinance recently passed by the Common Council of Binghamton, N. Y., the maximum speed permitted automobiles is seven miles per hour. It was passed in utter ignorance of the fact that there is a State law expressly prohibiting a reduction below eight miles an hour. Just before the Binghamton law went into effect the discovery was made that it conflicted with the law referred to, and now the former will have to be amended.

Under the statute known as the Doughty law the eight mile rule is plain. The clause relating to it is as follows:

"No ordinance, rule or regulation adopted by the authorities of any municipality in pursuance of this section or of any other law shall require an automobile or motor vehicle to travel at a slower rate of speed than eight miles per hour within any city, town or village of the State in the built up portions thereof, nor at a slower speed than fifteen miles per hour where the same are not built up."

The only way out of the quandary seems to be the raising of the limit from seven to eight miles per hour.

SPEED LIMIT REDUCED.

Fourteen Miles per Hour now Maximum Average Rate—New Marking Necessitated.

With the Reliability Run of the Automobile Club of America but one week off, and the arrangements rapidly nearing completion, interest in the event is steadily increasing.

The book of rules, which has gone to press, contains one important and several minor changes. The former consists in the substitution of fourteen miles as the maximum speed for the fifteen previously fixed upon. To obtain a first class certificate a car must average between twelve and fourteen miles for the six day's run, instead of between twelve and fifteen, as at first arranged. Similarly the four cups awarded to the cars making the highest number of marks will go to those vehicles making perfect records, or the nearest to it, fourteen miles being taken as the maximum speed instead of fifteen.

The change was made in order to avoid any possibility of violating speed laws in the different sections traversed. In many cities and towns the maximum speed permitted is 8 miles per hour; outside of these it is 15 miles in Connecticut and Massachusetts; while in the country districts of this State it is 20 miles.

To observe the 8 mile rules where they are in force and yet maintain an average speed of 15 miles for the entire journey, as would have had to be done to obtain the cups referred to, would have required a greater speed, in places, than 15 miles per hour. This would have been all right in New York outside of the cities and towns, but in Connecticut and Massachusetts it would have been in violation of the State statutes. Hence it was deemed advisable to make the change referred to in order to forestall any complaints that might be made.

Owing to this recasting of the speed, a change in the number of marks constituting a perfect record has been necessitated. The system remains the same, but the basis of computation is changed. Instead of obtaining the maximum number of marks for each day's run by multiplying the number of miles by 4—this being 4 minutes to the mile at the rate of 15 miles per hour—4.285 (minutes to the mile at 14 miles per hour) becomes the standard number. Under the old plan the maximum number of marks that a car could obtain for the entire run was 1,953.2, being four times the total number of miles. As finally decided upon, a car can obtain 2,293.332 marks, this, in turn, being 4.285 times the number of miles covered in the six days. From this total 1 mark will be deducted for every minute the car stops, unless the stop should be a non-penalized one.

On the first day's run the cars are to travel from New York to New Haven (seventy-five miles), and a non-stop trip will credit the operator with 321.375 marks, being 4.285 marks for each mile; second day, New Haven to Springfield (69.6 miles), to 411.36 marks; third day, Springfield to Boston (96.6 miles), 413.931 marks. The same points are to be credited on the return trip, making 2293.332 marks, a perfect score, entitling the operator and his car to a certificate. If his speed averages twelve to fourteen miles an hour he will receive a first class certificate; ten to twelve miles an hour, a second class certificate, and eight to ten miles an hour, a third class certificate.

In addition to the cup offered to the car earning the greatest number of marks, donated by President Shattuck, each of the three members of the Run Committee has offered a cup. That of W. E. Scarrett is for second prize, that of G. F. Chamberlain for third, and that of John A. Hill for fourth.

With Some Sense.

If there were more of the sort of legislator produced in Lawrenceville, N. J., the automobile speed problem would soon be in a fair way of settlement.

Although hailed as another anti-automobile law, the ordinance passed a few days ago by the township authorities has much to commend it. Under its provisions automobiles and motor cycles must not run at a higher rate of speed than twelve miles an hour, the rate of speed must be lessened at road crossings, and if horses become frightened the machine must be stopped; persons leaving such machines must see to it that precautions are taken to prevent accident; any one tampering with such machines will be arrested; lights must be shown one hour after sunset and one hour before sunrise—two white lights showing the direction which vehicle is proceeding and one red light in rear.

A penalty of not less than $10 and not more than $15 is provided.

Decision was Reserved.

The defendant's appeal in the case of the people against Harry S. Woodworth was argued before County Judge Sutherland at Rochester, N. Y., last week. Briefs were submitted and decision was reserved.

The defense is based principally on three contentions. The defendant argues that the prosecution failed to show that the automobile was operated by him; that it was a reversible error to allow witnesses to testify as to the defendant's coming, as well as his going, through the town of Brighton; that the prosecution failed to produce any testimony to dispute the defendant's evidence that it would have been impossible for the machine to have exceeded the speed limit when the lever was on the second notch.

Woodworth was convicted on May 27 of violating the speed law relative to the speed of automobiles. The case was tried before Peace Justice John Downs. A fine of $50 was imposed.

The Milwaukee Automobile Club is endeavoring to induce the State Fair authorities to run automobile races this year.

VICTORIOUS AT HOME AND ABROAD.

The White Steam Carriage

WINS OUT IN ENGLAND'S RELIABILITY CONTEST.

True to its former showing made in this country, a WHITE STEAM CARRIAGE completed the 650 miles test with

AN ABSOLUTELY CLEAN RECORD,

being one of two out of seventy entries to achieve this distinction.

The conditions of this run were unusually severe, the competing vehicles being required to make five separate journeys over different routes, and submit to brake contests and hill climbing trials.

The WHITE STEAM CARRIAGE used was a six horse power vehicle taken from stock and not only scored

1800 POINTS OUT OF A POSSIBLE 1800,

but demonstrated its fuel economy by using only 13 quarts per day.

Both its track records for speed and its road records for reliability prove that

THE WHITE IS A THOROUGHBRED.

Entered as second-class matter at the New York, N. Y. Post Office, November, 1900.

NEW YORK, OCTOBER 2, 1902.

Situation Not Altered.

The fact that a State licensing scheme for automobiles has been officially indorsed by the Automobile Club of America and the National Association of Automobile Manufacturers does not alter the fact that it is class legislation and a gross discrimination against this type of vehicle.

A Matter of Assumption.

The full iniquity, the inherent viciousness, of the Cock's law, now on the statute books of this State, become more apparent the longer it remains in operation.

A more pernicious example of class legislation it would not be easy to find. It singles out motor vehicles and imposes on them restrictions that would be, if everywhere enforced, well nigh intolerable. Except here and there, however, no pretence is made of enforcing it. It remains a dead letter until such time as autophobes combine to persecute automobilists—the innocent along with the guilty—by insisting that its archaic provisions be lived up to.

Under it no automobile can be driven faster than eight miles an hour in the incorporated limits of any village or town, whether built up or not, unless an ordinance exists permitting a greater speed. None but motor vehicles are subjected to this stringent restriction. It is aimed at them, and them alone.

This law, which was passed last spring, conflicts directly with the much more moderate Doughty law, which became operative in 1901.

The latter provides that no ordinance shall be passed fixing the speed at less than eight miles an hour in the built-up portion of villages and towns, or fifteen miles an hour in the portions not built up.

As a matter of course, the prosecutions against automobilists are brought under the Cock's law, the Doughty being ignored entirely. The purposes desired are attained much easier in this way, and it is assumed, quite as a matter of course, that the Doughty law is superceded by the Cock's wherever the two conflict.

This view is contested by a number of eminent lawyers, and has never been passed on by a court. Until this is done automobilists will continue to be held at a disadvantage. It was at one time promised that a test of the matter would be made, but no steps looking to this end have ever been taken.

THE WEEK'S CASUALTIES.

RAILROADS:	Killed, 11. Injured, 24.
TROLLEYS:	Killed, 5. Injured, 45.
HORSES:	Killed, 4. Injured, 15.
BICYCLES:	Killed, 0. Injured, 1.

TOTAL: KILLED, 20; INJURED, 85.

An Instructive Comparison.

That the automobile is not alone in its death and injury dealing work, as one might suppose to listen to the outcry that is constantly being made, becomes plain upon reading the lengthy list of other accidents reproduced on another page.

They cover but a few days, and are selected without the exercise of any very great industry. For all that, they make a grisly exhibit, one that is not pleasant to dwell upon. But they tell a tale as it could be told in no other way, a fact that is ample cause for reproducing them.

Compared with them the list of automobile accidents almost shrinks into insignificance.

It should be remembered, too, that while the latter are intermittent, magnified and frequently distorted, the former go on day after day, month after month, and year after year. It is a tale of horror that never ends, and is being steadily augmented and must be continued to be for all human time.

Nor is the half, nor even the quarter, told. The tally of railroad accidents would, if made public in all its hideous and merciless accuracy, "stagger humanity." But it is not told and need not be.

All this is one of the penalties we pay for the highly complex life we moderns live.

Most of it is unavoidable, and, therefore, rightly minimized. No real necessity exists for racking tender hearts with the dismal disclosures, and ordinarily we draw the veil over them and see as little of them as possible.

Such an attitude will prevail regarding automobile accidents. The railroad train, the trolley car, the bicycle—all went through the same experience, and when people became accustomed to them, or tired of them, the sensational stories ceased to interest, and then ceased to be told.

Will Cause Much Inconvenience.

Sound as is the reasoning which dictated the change in the maximum average speed rate in the Reliability Run from 15 to 14 miles, it is certain to cause considerable inconvenience to both drivers and observers.

In consequence of this change the former simple method of calculating the time which should be consumed in covering the daily runs is rendered out of the question. Instead of being able to arrive at the desired figures by simply saying "4 times 40 are 160," it will be necessary to take out a pencil and multiply 40 by 4.285. As the number of miles becomes greater the difficulty will increase proportionately.

The labor of calculating the average times will also be enormously increased.

One Way to Make an Impression.

If more automobilists would show themselves considerate of the feelings, as well as the rights, of other users of the road there would be much less bitterness against them than is now being exhibited.

Much depends on the circumstances, of

Digitized by Google

course, and one cannot be expected to be constantly catering to the whims of timid or fussy drivers. But, on the other hand, it is not absolutely necesessary to go about with a chip on one's shoulder, with the air of defying people to assail one's rights. Of the two ways it is infinitely better to err on the former side.

An example of the better way to manage these things was witnessed last week on a quiet road in one of Boston's suburbs.

A gasolene car, big and noisy, with a well filled tonneau body, was bowling along at a moderate pace, when a carriage coming in the opposite direction was encountered. In the latter was an elderly woman, who was driving, and a couple of children.

The horse was a sedate nag, and beyond raising its head and taking a look at the strange vehicle approaching him paid no attention to it.

But its driver was not so easily pacified. Visions of a runaway seemed to appear before her, and she waved her hands frantically as a signal to stop. The automobile could have gone by without further incident than a violent agitation of the elderly female's mind. But the chauffeur took a more graceful course. He threw his clutch out and brought the car to a sudden stop. Then he sprang out and took the horse by the head and led him past the throbbing vehicle. Without waiting for thanks, he got into his seat again and drove off.

Unnecessary his action may have been. But it was graceful, and it is long odds that the recipient of the courtesy willl have a better opinion of automobilists than if her ill founded fears had been ignored entirely.

The British Trials.

In no way could the wonderful advance in the matter of reliability which the motor cars of to-day have made be better shown than in the result of the British tests of last month.

Of the 54 starters, 45 vehicles finished. Of these 11 made a rather poor showing and count for little in supporting the contention advanced above. But the remainder, being just short of two-thirds of the whole, may fairly be said to have covered themselves with glory.

Of the 34 cars referred to only two made absolutely perfect records—one of our own Whites and a Wolseley. Thus the two countries, which are commonly credited with being behind in the matter of automobile design and construction, viz, America and Great Britain—really make a much better showing than their rivals, France and Germany. This is all the more remarkable in view of the fact that one Panhard and two Daimler cars were among the contestants.

No less than 15 of the cars have charged against them a smaller number of marks than 10.

The significance of this will be seen when it is remembered that under the system of scoring employed one bad mark was given for each minute, or fraction thereof, of unpenalized stops made by the cars. The highest number of marks scored against any one of these 15 cars was 9, which may have been for one stop or for nine. This result was the lapse from perfection of cars competing for six successive days, over 650 miles of different roads, and while constantly under the closeht possible scrutiny.

Six more of the 34 cars referred to had less than 20 marks scored against them. Of the remainder only four were charged with 50 marks or more.

Turning to the stops which caused the scoring of the bad marks, it is found that many of them are of a trivial character, while others are due to errors of judgment or miscalculation on the part of the drivers.

Three of the cars were particularly unfortunate, all of them coming within one mark of a perfect record.

One of these, a Peugeot, was accidentally stopped by the driver, there being absolutely nothing the matter with the vehicle or its engine. A Panhard had to change an accumulator, and thus earned its single bad mark. A De Dion car was punished to the same extent by reason of a terminal wire snapping.

Enough has been said to show that the cars as a whole demonstrated their ability to cover a week's run without giving any trouble worth speaking of.

Even a year ago, when the run was from Glasgow to London, the tale was a very different one, and yet it was considered to mark a considerable advance in efficiency.

It is interesting to learn that the newly organized Long Island Highway Protective Society does not propose to wage an indiscriminate warfare on automobiles. On the contrary, its incorporators "believe that a majority of those who have these vehicles will sympatahize with them, and they expect that many of them will become members of the society."

It would be quite as interesting to know just what the association is doing to safeguard the highways where scorching horsemen and wheelmen are concerned. So far their activity has been confined entirely to automobilists. Yet it will scarcely be contended that they are the only violators of the ordinances relating to speed. Nevertheless we have yet to hear of the slightest attention being paid to any one else on the North Shore roads.

In the reliability run, which starts next week, the contesting vehicles alone will cover somewhere near 35,000 miles in their journey to Boston and return. Probably an equal distance will be driven by other vehicles which accompany the tourists or go to meet them and escort them into the towns en route. To make the run the competing vehicles must consume somewhere in the neighborhood of 3,500 gallons of gasolene.

It is refreshing to learn that there is one place in the world where there is no legal speed limit for automobiles. It is the Emerald Isle which bears this proud distinction, and although the Irish roads are none of the best, that country is still being strongly pressed as the best course for the 1903 Bennett Cup races.

It is no longer necessary to "seek the bubble reputation at the cannon's mouth." All the seeker after fame or notoriety has to do is to propose a new and more restrictive ordinance relating to their use of the highways, or to invent some new way of harassing them. Immediately his object is achieved.

The Automobile Club of Great Britain and Ireland is without a set of racing rules. It is suggested that an international conference between race promoting bodies, to agree on uniform rules, would be a good thing. There is need of something of the sort.

The politician will no longer make cart tail speeches during the coming campaign. He will stand on the tailboard—if he can find it—of an automobile and let eloquence flow.

There are cycle paths, speedways for horses and bridle paths—but the automobilist knows not where he can speed his machine unless he wants to get arrested.

"Bounders on boilers" is the alliterative way in which an indignant Briton characterizes automobilists.

Commentaries

Wonder why it is that Providence, R. I., comes nearer than any other city to making the automobile a real competitor of the horse in their contest for society favor? Be the cause what it may, the fact remains that the very best people in Rhode Island's capital are either automobilists themselves, or, at least, friendly disposed toward the motor vehicle, and hence it is that the Providence race meets are quite as successful socially as they are from financial and sporting points of view. Considering the many efforts which have been made to induce society with a big S to bestow upon the automobile some of the public favor it lavishes upon the horse, it is really remarkable that so little success has been met with. In fact, outside of Providence it might almost be said that the effort to win society favor for automobile events has been practically a failure, and yet at the same time all those who are foremost in the smart set own, use and like automobiles. That America should in this instance positively refuse to endorse the action of foreign royalty and aristocracy makes the whole thing even more perplexing. Certainly no one can say that the automobile abroad is not accorded as much social favor as the horse, if it does not receive even more than the animal. It certainly, however, is not so in this country just now, though it may be in the future, since we seldom allow the foreign fashion setters to get entirely out of our initiative range.

* * *

Since the beginning of automobiling in this country a small, pestiferous, but boisterous, clique of calamity howlers has done what it could to promulgate an anti-cyclist feeling among the users of automobiles. That these efforts of the pestiferous ones have not been more successful was due entirely to the good sense of those they sought to influence and to the total lack of influence possessed by the calamityites. Through all of it the wheelmen gave no just cause for any but the friendliest feelings on the part of the automobilist, but the cyclists were no more free from the pestiferous element than were the automobilists, and so it came to pass that one of these creatures has, without either cause or judgment, appeared before the Board of Aldermen with an ordinance to license automobilists. Most unfortunate is this attack from a quarter which the users of automobiles had every reason to think only aid and support would come. The trouble causers, who have all along tried to embitter the motor vehicle people against the cycling ones, have not been slow to seize upon this as proof that all they have said against the wheelmen was true. I am glad to see that you took occasion editorially to place the affair in its true light. The average wheelman, like his brother of the bigger vehicle, is a progressive, intelligent individual, whose sympathies are all with the motor vehicle in its struggle for justice, and it is therefore very much to be regretted that the cyclists should be called upon to suffer by the ill advised, selfish action of one of their number, who in his selfishness represented no one but himself. The case can be put in this fashion:

* * *

You can sometimes dodge the lion who selects you as his prey;
You can even catch and cage him and observe him at his play;
The wolf and the hyena are uncanny to the view,
But they leave you unmolested if you know a thing or two.
But there's one terrific creature we encounter now and then,
Who defies all calculations to protect his fellow men;
He balks our fondest purpose, and he plays the very deuce;
There is nothing that can stop him when the fool breaks loose.
To reason he will turn a dull and unresponsive ear;
He hasn't wit enough to entertain a sense of fear;
He plunges to destruction; never stops for looking back,
And laughs when wiser people are obliged to clear the track.
For years he may be dormant, then he wakes to sudden joy,
And thinks earth was created for his own especial toy.
You may sometimes try to save him, but it isn't any use,
You must simply wait and tremble, when the fool breaks loose.

* * *

Thirty or more years ago the people of the North went South to emancipate the negro; at the conclusion of a visit, which was prolonged very much in excess of the time set for its termination by the visitors, the negro was free, and the South had very little left but mules, and mighty few of them. Now the North is again invading the South; this time her mission is to emancipate the mules through supplanting them with motors. The latest invasion promises to be almost as successful as the first, even if it be less strenuous and pension provoking than was the visit of three decades ago.

* * *

From present indications those who take part in the Reliability Run will not be troubled much with dust. Rain has fallen almost for a month now and the roads of New-England must be in pretty fair shape, at least they should not be as dusty as they usually are. While moisture may thus rob the New England highways of some of their dusty terrors the assorted samples of Plymouth rock and other rocks not Plymouth which decorate many of the Connecticut and Massachusetts roadways will all be found in business at the old stand working overtime to make their presence known to the reliabilities. But, even so, the course of the run this year is a vast improvement over the one chosen last year, for which there is much to be thankful.

* * *

Of course, I know it is perfectly useless just at this time to ask the press or the public to admit that the "deadly automobile" is not always so from the callousness or carelessness of its driver. There are two sides even to this automobile allegement, however, and so not infrequently the accidents which occur wherein a motor vehicle and a pedestrian figure prominently the real cause of all the trouble is the careless traveller on foot, who walks, runs or jumps—according to age, sex or condition—right in front of a vehicle trusting to life saving purposes to Providence and the police. No one who has not been responsible for the driving and directing of a rapid-moving vehicle has any idea of how careless and foolhardy the average pedestrian can be and is. An expert photographer was talking to me recently about this very thing. He told me that for his own protection he intended placing a camera on the dashboard of his runabout disguised as a lamp, then, when the foolish or the foolhardy are about to suffer from their lack of attention to where they are going or how, he will only have to press a button with his foot and by doing so secure photographic proof of the cause of any accident which may occur and of which he might be accused of causing. I'd like to have a set of such photographs, because I'm sure that whatever else they might be mistaken for any one could see at first glance that they were not studies of still life.

* * *

In an English paper published in the interests of the human butcher business, that is to say, surgery, I was grieved to read recently that those who are responsible for the steering of automobiles on long or speedmaking trips are very likely to experience "paraesthesia in the fourth and fifth fingers, with impaired sensibility, and paresis in the interossal lumbicals and the adductor pollicis." You or I, not being in the butcher trade, would say that a long continued grasp of the steering wheel made the hand numb, provided we mentioned the matter at all.

* * *

While the foregoing was bad enough a bit further along in the same interesting periodical I read that in addition to the danger the motor vehicist's lumbicals and pollicis were subject to if he persisted in using an automobile, he was liable to I don't know what from "inhalation of extraordinary quantities of exceous and calcareous substances cooperating with spicules of tritulated venetationer." After that I made up my mind I either had to give up all ideas of automobiling or else quit reading English surgical papers; so I promptly availed myself of the last named alternative, and henceforth I'll confine my literary browsings to literary fields wherein less deadly information abounds.

One Week's Casualties Not Caused by Automobiles.

DUE TO RAILROADS: { Killed, 11. Injured, 24. **TROLLEYS: { Killed, 5. Injured, 45.** **HORSES: { Killed, 4. Injured, 15.** **BICYCLES: { Killed, 0. Injured, 1.**

TOTAL: KILLED, 20; INJURED, 85.

At the moment there is an urgent and apparently a general demand for the licensing of automobiles. Many automobile users and well wishers indorse it.

No other vehicles, save those of a public nature, kept for hire, are licensed. Experience has shown that there is no necessity for a measure of the kind. The evils and abuses consequent upon the use of such vehicles are not too great for the duly constituted authorities to cope with.

But, it is urged, the automobile is in a class by itself. It gets into the hands of reckless or inexperienced persons and accidents result that shock the community and make absolutely necessary some restrictive measures.

That accidents happen, caused by other vehicles, is at least hinted at by the accompanying list. It is taken from the newspapers, those same journals which give a small head and from two to six lines to the killing of a child run over by a truck, and a triple head and well nigh a column to the latest automobile accident, whether it be of a serious character or not.

September 25.

Amelia, Va.—E. G. Drake was ground to death under a railroad train; suicide is suspected.

Fort Dodge, Ia.—Jerry Begley, while drunk, was run over by a train and killed, together with his team of two horses.

Port Jervis, N. Y.—William Feeley was run over by a railroad train; died from his injuries.

Spring City, Tenn.—J. M. Cox was run over by a freight train and instantly killed.

Richmond, Va.—William Moore was run over by a railroad train; killed.

Mayville, N. D.—Andrew Hanson was run over by a railroad train; killed.

Columbus, O.—Clayton Creachbaum was run over by a shifting train; killed.

September 26.

Oneida, N. Y.—Pearl Bates was thrown from his bicycle and badly cut about the head.

Plattsburg, N. Y.—Arthur Wray was thrown from a wagon owing to the horses becoming frightened by the load coming loose; leg broken in two places.

St. Louis, Mo.—Charles G. Woods, wife and child, trampled on by runaway horse; badly bruised.

Wapakoneta, O.—Thomas Ramsay, struck by trolley car while driving; unconscious and seriously injured; died subsequently.

Buffalo, N. Y.—Mrs. Minnie Spears, fell from trolley car; severely cut and bruised.

Buffalo, N. Y.—John Barone, fell from trolley car; scalp wound.

Hartford, Conn.—George H. Rogers, fell from trolley car; right leg broken.

Pittsburg, Pa.—James Perkins, 10 years od, struck by trolley car; died from injuries.

Milwaukee, Wis.—J. Kelley, driver, struck by trolley car; injured.

Pittsburg, Pa.—Mrs. Rachel Black, struck by glass in trolley car collision; cut about head and hands.

Pittsburg, Pa.—Trolley car got beyond control and struck a teamster and injured a number of passengers.

Rawlins, Wyo.—Freight train wrecked and six men buried under debris.

Washington, Ind.—Work train wrecked and six men dangerously injured.

Wequetequock, R. I.—Brakeman struck by overhead bridge and skull fractured; died from injury.

September 27.

New York—Della Fineberry, aged 3 years, run over by heavy truck; killed.

New York—Henry Harrington, truckman, kicked into a "dump" by balky horse; leg broken.

Brooklyn, N. Y.—Vander Kompad, jumped from an ice wagon; leg broken.

Newark, N. J.—Emma Blum, knocked down by coal wagon; considerably hurt.

Leesburg, Va.—B. Cooper, 14 years old, thrown by horse he was riding to market; killed.

New York—Gus Wilson, knocked down by runaway horse; left shoulder dislocated and severe scalp wounds.

Delton, Wis.—Thomas Scott, finger of right hand bitten off by horse he was feeding; will have to be amputated.

Providence, R. I.—Henry Repel, driver, kicked by horse; hemorrhage of eye caused, with probability of losing sight, and leg badly bruised and cut.

Brookln, N. Y.—Charles Morris, conductor, fell from trolley car; skull factured.

Pittsfield, Mass.—Trolley car struck carriage containing four men and injured all.

Wilmington, Mass.—Two trolley cars collided and injured both motormen and two passengers.

Tewksbury, Mass.—Two trolley cars collided and injured four passengers and both motormen, one fatally.

September 28.

Stamford, Conn.—Wm. I. Toepher, thrown by fractious horse; skull fractured, causing death.

September 29.

Newark, N. J.—John Reilly, knocked down by trolley car.

Brooklyn, N. Y.—Two trolley cars collided, bruising a passenger and internally injuring a conductor.

Brooklyn, N. Y.—Trolley car struck two vehicles, injuring both drivers.

September 29.

St. Louis, Mo.—Mrs. J. W. Ashton and little daughter were thrown from a trolley car by defective gate. Mrs. Aston's hip was crushed and head bruised, and the child's arm was broken and it was injured internally.

Paris, Ont.—Mrs. Allen Edgar and Miss Agnes Gourley were struck by railroad train and killed.

Detroit, Mich.—Frank J. Schraffan, driver of a brewery wagon, was fatally injured by his runaway team.

Detroit, Mich.—George Grosshaus fell from trolley car; killed.

Brooklyn, N. Y.—Michael McMahon fell while trying to board a trolley car; arm injured and scalp cut.

September 30.

Elizabeth, N. J.—E. J. Melville, struck by trolley car and killed.

Taunton, Mass.—Eleven passengers were injured by a trolley car collision; none of them seriously.

Chicago, Ill.—One man killed and another injured in a freight train wreck on the B. & O. road.

Highland Falls, N. Y.—Major-General C. F. Roe was thrown from his horse and badly cut about the head.

Irvington, N. J.—Thomas E. Brown was run over by a trolley car and both his legs crushed.

Changes in Manufacturers Ass'n.

Owing to the resignations of A. L. Riker and Dane E. Rianhard, first and second vice-presidents, respectively, of the National Association of Automobile Manufacturers, a number of changes have been made, the following new officers being elected: H. Ward Leonard, first vice-president; F. M. Lande, second vice-president; Charles Clifton, third vice-president; Harry Unwin, secretary, and Windsor T. White, member of executive committee.

Will Banquet Tourists.

Taking advantage of the fact that the second all night stop of the participants in the reliability run will be made at Springfield, Mass., the Knox Automobile Co. have arranged to entertain the visitors. The company will tender a banquet to the officials, chauffeurs, observers, reporters and others, to be given at the Cooley Hotel, Friday evening, October 10. It is expected that 200 guests will be present.

Ball Plant in Meriden.

Negotiations have been practically concluded, according to press dispatches from Meriden, Conn., whereby the German-American Steel Ball Co. will purchase the plant of the Meriden Malleable Iron Co., of Meriden. The ball concern is capitalized at $1,000,000, and it will manufacture steel balls for ball bearings under German patents. Officers state that within a year they expect to employ at least 1,000 hands.

Details of Entries in the A. C. A. Reliability Contest.

Belated entries received to date make the list of contestants in the Reliability Run to Boston and return, starting October 9, seventy-eight, an increase of thirty-one since last week.

The number is slightly smaller than the entry list for the Buffalo run last year. The latter had 86 entrants and 75 starters. The number of experimental cars in the present list, however, is considerably less than it was a year ago, and the number of finishers is likely to be correspondingly larger. Better roads and, in all probability, better weather conditions will prevail in the present run.

Below will be found a table giving many of the constructional details of the cars entered, as called for by the entry blanks. They make an interesting study. More than anything else, they tell the story of the present trend of design and reveal some conditions that are surprising.

As has always been the case, the gasolene type of car has a large lead. No less than 59 vehicles come under this head, as against 18 steam and 1 electric. Of the three classes provided, divided according to weight, the medium weight cars comprise a majority of the whole. Class A, under 1,000 lbs., has 13 entries; Class B, between 1,000 and 2,000, has 45, and Class C has 20.

The horse powers in Class A ranges from 4 to 6, the first mentioned figure being the favorite. In Class B the range of claimed horse power is from 4 to 16. Not all of Class C are high-powered cars. The lowest is 8 H. P., while the maximum is 24.

The tire statistics also reveal some interesting facts. The double tube type has a big lead, there being 52 cars fitted with them, and only 24 having single tubes. But one car, the Neftel electric, is shod with solid tires.

The complete table follows:

No. Official.	Manufacturer.	Entrant.	Number of passengers vehicle can carry.	Type of motor—gasolene, steam or electric.	Weight, including fuel, supplies and equipment.	Capacity.		Tires.				Engine.	
						Water. Gals.	Gasolene. Gals.	Make.	Size.	Weight per tire.	Double or S. tube.	Rated H. P.	No. of Cyl.

BRITISH TRIAL LESSONS

Great Improvement Shown by Contesting Cars —Native Products Praised by Sturmey.

"The trials are over, and it must be admitted they have been a considerable success, and that the lessons of former trials have not been neglected," says Henry Sturmey in the "Autocar." "In this connection I may incidentally mention that, although I was informed that the committee could not see their way to adopt the suggestions I made in these columns on July 5th, with two exceptions—the method of marking for horse-power and the freedom to change sparking plugs without penalization—they all were adopted, and I cannot help thinking with benefit to the trials.

"At the last moment the committee sought a means of evening the pace and preventing the alternate racing and crawling of the Glasgow gathering, and it must be admitted the method adopted met with a very considerable measure of success, the several stages being divided into a series of sub-stages, each of which had its own time period, and the treble duty was placed upon the observers of assisting the driver's judgment in checking the pace and deducting marks for exceeding the maximum allowable.

"So far as I was able to see this answered very fairly well, but I would suggest that another year the duties of the observers should end at recording the actual times of completion of the different sub-stages, leaving the actual mark deductions to be made by the judges. This in the interests of uniformity and strict fairness, because I found by conversation with some observers that very different constructions were placed upon their instructions upon this point; some observers, for instance, being severely accurate to seconds, whereas others considered that 'half minutes did not count.' Others, again, because no marks were to be deducted for error on the first three sub-stages of any stage, considered that the first three sub-stages 'didn't count,' and virtually allowed free running thereupon, whilst their fellows were—as they should have been—as strict and accurate on these as upon the rest.

"The arrangement generally, however, worked well, and although crawling tactics were occasionally resorted to, it was rather the result of speed miscalculation, or a failure on the part of the observer to see or to recognize the landmarks forming the boundaries of the stages, than to any intentional exceeding of the speed limits at any part of the stage, and the system generally is to be commended for future use. Whether it was due in any degree to this efficient keeping down of speed, or rather to the generally improved efficiency of car construction, is uncertain; but to those who had previously gone through the thousand miles and the Glasgow trials the paucity of 'incident' in the nature of stranded and temporarily disabled cars was most striking. Although during the trials eight cars experienced sufficiently serious breakages to put them out of the running, they were the exceptions which proved the rule, and of cars which were literally dragged through by the pluck and tenacity of their drivers in dealing with serious derangements from day to day there were none, although instances of such were fairly numerous in former trials.

"For the most part the cars ran through their daily runs without need for adjustment of any kind, and where stoppages were recorded they were generally due to quite minor and readily dealt with causes. Curiously enough, most of the tire troubles seemed to affect those vehicles wearing tires specially entered for the tire trials, and the advance made in the commercial article, as exemplified by their performances in the trials, can only be characterized as remarkable. I had seats on four different cars during the week, and in no single instance was a puncture experienced, or inflation necessary, and I believe I am correct in stating that each of the four vehicles went through the whole of the 650 miles with no more trouble from their tires than during the days I was upon them. In this connection it would be interesting to know the exact total of stops for tire trouble and the nature of the trouble, and if this were compared with the 40,000 or thereabout car miles run during the week, I fancy the average would work out at very much less than one stop per thousand miles running.

"Owing to the speed regulations, it was rarely possible to obtain any comparison of the real relative powers of the cars except upon hills, for where these were really steep they brought the pace of the best of them down to the regulation level, and then when two or three cars were together—although I saw very few instances of reckless driving or risk taking—it was a case of each car 'doing its prettiest,' and the drive at these points became really interesting.

"The efficient manner, however, in which the medium-powered cars tackled the slopes, and the really slight (and in cases the absence of) advantage the majority of the higher-powered vehicles had over them, coupled with the fact that the full powers available on the larger vehicles could rarely be utilized upon the level owing to either unsuitable road conditions or police restrictions, strongly impressed upon me—and I know upon others also—the opinion long held that, given sufficient power in relation to weight for efficient hill-climbing, the use of high-powered vehicles for traversing British roads is quite unnecessary for the general requirements of the average tourist.

"Another conclusion which could not help forcing itself upon the critical observer where such a varied collection of cars were running together for comparison was that, generally speaking, in point of noise and vibration, a really striking improvement all round was noticeable. The worst sinners were not by any means confined to cars built in this country, whilst for quietness and smoothness of running the best of the English cars were more than on a par with the foreign ones—I him, of course, speaking of the petrol vehicles—and were, if anything, clearly in advance.

"Of the eight cars which were officially returned as 'broken down,' three only were of British construction throughout, and five were foreign, or mainly foreign, whilst it is also a noticeable fact—again dealing only with the petrol cars—that forty per cent. of the British-built vehicles secured over 290 out of 300 marks on each day's running, as against less than thirty per cent. of the foreign cars, all of which would go to show that on the point of reliability and evenness of performance British cars are now not only the equals of, but superior to, their continental rivals—a fact upon which all interested in the advancement of British industry must rejoice.

"Taken generally, the running of the cars throughout was so regular, and the absence of incident so marked, that one was almost led to the conclusion that but little further need exists for trials of this character, yet such a conclusion would be scarcely correct, and whilst the present trial have clearly demonstrated the remarkable advance which has been made in the art in the past two years, the trials should be continued until practically all the cars entered can come through without a breakdown, and virtually without a stop, and when this result is attained—and at the present rate of progress it may be reached sooner than one would think—all that can be got out of the trials in the way of proving to the public the reliability of the autocar will have been secured, and the club may very well give them a rest.

"By that time, too, common usage and general experience will have simultaneously proved the same thing, and the public will cease to take interest in affairs of the kind. Indeed, although considerable numbers of people turned out to see the cars en route, the general interest in the competitions was lukewarm and flat when compared with the enthusiasm of the Scottish crowds and the dense throngs and exuberant greetings with which the cars were received on the thousand miles. Automobilism is, in short, rapidly taking its place in the daily life of the people, and is, except in isolated districts, ceasing to be anything out of the common."

Not the Automobile's Fault.

A double victory is to be recorded concerning one of the widely heralded "automobile accidents" in this vicinitq. The grand jury of Somerset County, N. J., has completely exonerated the automobilist who, it had been said, was indirectly responsible for the death at Bernardsville of Mrs. W. V. Snyder, of Newark.

An investigation of the circumstances was made, but the evidence, so it is given out, showed that the machine was not moving over ten miles an hour and tnat the condition of the road at the point where the team was frightened was partially responsible for it.

INNER TUBE LORE

Methods of Making Repairs and Solutioning on the Patches—Puncture Fallacies.

To mend an inner tube on the road is not the easiest or pleasantest occupation, and the uses frequently has a lot of trouble in battling with punctures and old patches that persist in coming off, and at an inopportune moment.

To make a patch hold properly it is necessary to do two things, and do them properly.

Firstly, to thoroughly clean and roughen the surface of the tube, and, secondly, to let the solution thoroughly dry before applying the new patch.

In the case of an old patch coming off, it is absolutely essential to remove all traces of the old solution, and the writer has found nothing better in the world than a small, hard nail brush well weted with petrol. This performs the duty with less exertion and more cleanily than glass paper.

When the place is thoroughly cleaned of old solution, take what is known as a file card and well roughen the tube right out to the full size of the patch that is going to be put on. A file card is a tool loke a nail brush with short steel bristles, and is used for cleaning the metal dust from the teeth of a file. It can be obtained with a handle like a nail brush, and is far better than matchheads or glass-paper. It gives a rough "tooth" to the tube, which makes the solution adhere splendidly. Rub on the solution to the cleaned place and, before applying the patch, let it stand as long as your patience will let you. Two or three hours, or even more, will not hurt if you are mending the tube at home.

If you have no file card with you, wrap the glass-paper round the back of the nail brush or round the handle of a file—this gives a firm grip to hold and does not cramp the fingers.

Never put prepared canvas on an inner tube.

Before inserting a fresh inner tube after a puncture, do not fail to pass your hand round the whole of the interior of the outer cover. The nail that caused the puncture may be protruding through the canvas ready to attack the new tube directly it is pumped up. Neglecting this precaution can be likened to the action of a man who sits down on a tin tack, springs up astonished, rubs the sore place, and reseats himself on the tack. Remove all the grit and small flinty particles that are to be found in the outer cover, and sprinkle French chalk lavishly before putting in the new tube. Partially inflate the tube before replacing the cover, and pass your hand round between the tube and cover to make sure that the tube is not twisted. These small precautions take a very little time to do while the cover is off, but they may save you a reptition of the puncture or leak.

The word "puncture" is the most badly used word amongst motorists. Everything is called a "puncture"; the proportion of real punctures is small. A more correct description of one's trouble would be: "I had tire trouble owing to having previously put on a patch in a slovenly manner," or "I tried to mend a faulty place in the tube on the road, and hadn't the patience to do it properly." On a memorable attempted non-stop run a driver is reported to have taken out and replaced his inner tube twenty-seven times. He called them punctures! He should really have said: "I did a silly thing twenty-six times in succession."

ONE OF THE ELECTRIC 'BUSSES ON FIFTH AVENUE, NEW YORK.

Colors Will Distinguish.

In the approaching reliability run to Boston and return the three Grout vehicles entered will be distinguished by their novel color scheme. They are finished in red, white and blue, respectively.

WANT GENERAL ORDINANCE

Call for Meeting of Philadelphia Road Users to Frame Equitable Measure.

Now that the summer is over, the subject of automobile speed and other regulations is to be taken up in Philadelphia. Although an ordinance in the main satisfactory to motor vehiclists, which was tabled several months ago, is still to come up before councils some time this month, there appears to exist a desire to ventilate the subject still more thoroughly than has been done.

With that end in view, at a meeting of the Board of Governors of the Automobile Club of Philadelphia last week, John S. Muckle, vice-president and chairman of the committee on legislation of the club, offered the following resolution:

"Whereas, An ordinance, entitled an ordinance 'to regulate and license the running and operating of automobiles and motor vehicles, whether the motive power be electricity, steam, gasolene or any source of energy other than human or animal power,' was presented to Select and Common Councils of the city of Philadelphia last spring, and will be called up when Council reassembles in October; and

"Whereas, This ordinance may be objected to on the ground of its being 'class legislation;' therefore, be it

"Resolved, That the president of the Automobile Club of Philadelphia appoint a committee of two from this club, request the president of the Road Drivers' Association and the president of the Century Wheelmen each to appoint a committee of two from his organization and request the presidents of the steam and electric railroads of the city of Philadelphia to send representatives to a meeting of the above committees, said meeting to formulate a general ordinance governing the use of all vehicles of whatever kind in the city of Philadelphia, said ordinance to be presented to Select and Common Councils of this city, with the request that it take the place of all existing ordinances."

The resolution was adopted, and on motion Mr. Morris and Captain Muckle were appointed the committee from the Automobile Club.

An Interesting Traveller.

"Garrulous and incoherent" is the characterization the author places on "Two Thousand Miles on an Automobile," which has just been issued by the J. B. Lippincott Co., Philadelphia. Perhaps "rambling and discursive" would be better terms to employ, for it is not to be gainsaid that the reader who is looking solely for the doings of an automobile and automobilists had better seek them elsewhere than in this book.

No one who has had the good fortune to listen to one of the speeches or talks of Mr. A. J. Eddy, for it is the ex-president of the Chicago Automobile Club who is the author of "Two Thousand Miles," need be told that he is both witty and interesting. The production under notice is precisely what was to be expected from such a man.

A trip through Canada, New York and New England furnishes the material for this very modern traveller. The book is composed of about one part automobile to two parts generalization, some of the latter being striking to a degree. If Mr. Eddy's conclusions are not always agreed with, they are at least always plausible and well put. The moralizing at the birthplace of Samuel J. Tilden and on the Shaker community are cases in point. Always original, frequently daring, the writer holds his reader securely, his interest never flagging until the end is reached.

For the Carriage Trade.

An extensive exhibit of motor equipments for carriages and wagons will be made by the Westinghouse Electric and Mfg. Co. at the convention of the National Carriage Builders' Association, which is being held this week at Detroit, Mich. Three vehicles fitted with motors, etc., and six motors comprise the exhibit. Vehicle manufacturers will be shown how easy it is to equip their product with the Westinghouse apparatus, and thus enter the automobile field without having to produce the electrical parts themselves.

Races Again Postponed.

Ill luck continues to pursue the Detroit, Mich., races, originally scheduled for September 19 and 20. Postponed until after the Joliet, Ill., meet, rain necessitated a further relay on Monday. The next day it rained again, and after a conference between the manufacturers and owners and the promoters of the meet it was decided to postpone them until October 24 and 25.

Testing the Tires.

During the second week of the 3,000 mile tire trials conducted by the Automobile Club of Great Britain, 784½ miles were covered, giving a total for the two weeks ending September 13th of 1,434½ miles. Four of the tires went through the week without any mishap other than losing from 2 to 12 marks for pumping. The others suffered much more severely, one tire having lost 201 marks in all.

Exports Still Growing.

Contiuing its steady gain over last year, the exports of automobiles and parts for August reached a value of $71,907, as against $56,300 for the corresponding period of 1901. For the eight months of the fiscal year ending with August the gain is much greater. For 1902 the figures are $786,137, while for 1901 they totalled but $128,702.

Goes With International.

S. G. Rigdon, for four years in charge of sales for the Goodyear Tire and Rubber Co., has gone with the Internation A. and V. Tire Co. He will manage the sales department of the latter mentioned company. Mr. Rigdon is a man of exceptional ability and widely known in the trade.

MAGISTRATE AND PRISONER

They Were One, and Trial and Release Were Made in Short Order.

A great deal depends on whether a magistrate is in an automobile or out, when its occupants are charged with violating the speed ordinances. In the former case an acquittal is very likely to be the outcome, and this quite irrespective of the evidence in the case.

Last week, so the story goes, Magistrate Brann, of this city, who does not own an automobile, but has friends who do, started to take a short trip into the suburbs. It was while he was returning from this particular excursion that he and his friends were held up by the policeman. They had sped down Jerome avenue at a moderate pace and were crossing MacComb's Dam Bridge when they observed that they were being followed by a mounted policeman.

As they got to the south side of the bridge the policeman overtook them. Pulling up alongside of the machine he gruffly said: "I place you under arrest."

"What for?" asked one of the members of the party, timidly.

"For exceeding the legal limit of speed," replied the policeman, who was attached to the West 152d street station, but whose name is not know to the magistrate. It is not believed he recognized the latter, who had recently shaved off his mustache.

"You have made a mistake, sir," remarked Mr. Brann. "We have not exceeded the legal limit."

"I know better," rejoined the policeman. "You are under arrest and you must go to the police station."

"Well, I am Magistrate Brann, and if you insist on placing these friends of mine under arrest I shall hold court right here in this automobile and discharge them on the spot," hotly returned the magistrate, who felt that the policeman was officious.

The policeman blushed when he learned the identity of the person he was speaking to, but quickly recovering his composure he insisted that he was right.

"If you were not in this automobile and personally interested in its occupants, you would fine them $5 or $10 if I brought them before you," declared the policeman.

"No, I wouldn't!" shouted the magistrate. "I'd first examine into the case, listen to all the evidence and draw my own conclusions as to the justice of the complaint. In this particular case my conclusion is that the party that you want to arrest is not guilty."

The policeman was still trying to justify his action when a roundsman came up and ordered the policeman to patrol his post, and the incident was closed.

FAVOR LICENSE SCHEME

If Conducted by the State—Local Plan Condemned by Clubmen and Makers.

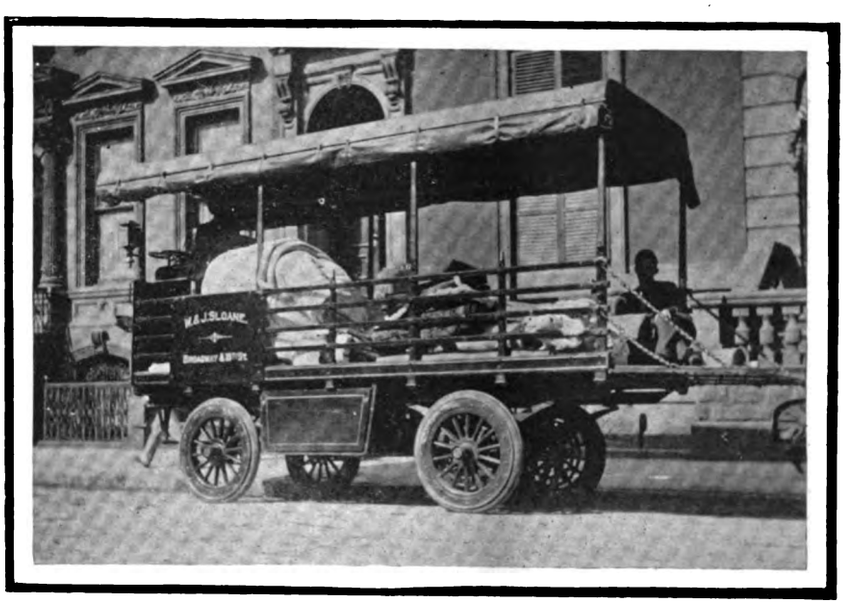
If the automobilists of this city and state elect to play the game of their enemies and indorse a licensing scheme, as seems not improbable, it will at least be one of their own fathering. They will not accept the one proposed for them by the League of American Wheelmen.

That much was decided at a meeting of the Board of Governors of the Automobile Club, held at the office of President Shattuck on Monday. The offensive ordinance introduced in the Board of Aldermen at the instance of the board of officers of the League of American Wheelmen, which was given in full in the Motor World last week, came up for consideration. It was unanimously decided that this particular ordinance should be opposed. This opposition is based on two objections to it. The first is that such a plan is expressly forbidden by the Doughty law, passed by the Legislature of 1901. Section 169a of that law reads as follows:

"Licenses or Permits for Automobiles.—Any person owning or operating an automobile or motor vehicle, whether the motive power of the same be electricity, steam, gasolene or other source of energy, except such as are used for public hacks, trucks or vehicles for hire, shall not be required to obtain any license or permit pursuant to the provisions of any local or municipal resolution or ordinance, or the rules or regulations of any commissioners, trustees, supervisors or other authorities having charge or control of any highway, public street, parkway, driveway or place, or pursuant to the provisions of any municipal charter or any other statute, except as herein contained."

The second objection is somewhat similar. It is that the club is opposed to local ordinances of this kind. Such a system was pronounced unpracticable, as under such a plan an operator would have to take out a license in every municipality through which he had to pass.

The discussion left little doubt, however, that the governors of the club favor a State licensing system, failing the inauguration of a national one, which seems to be quite out of the question. It is not all unlikely that the Legislature will next winter be requested to enact a law putting a licensing scheme into effect.



On Tuesday a formal invitation was issued to the National Association of Automobile Manufacturers to take joint action in the matter, and the following committee from the club was appointed: Messrs. George F. Chamberlin, W. W. Niles and Albert R. Shattuck.

The same afternoon the executive committee of the National Association met, accepted the invitation and appointed this committee: Messrs. S. T. Davis, jr., Frederick Martin Lande and H. Ward Leonard.

A nominating committee, composed of Dave Hennen Morris, W. J. Stewart and J. M. Hill, was appointed to report a ticket for the election of officers, which will be held on November 17. Mr. Shattuck, the present incumbent of the presidency, will not be a candidate for re-election.

"I have had the honor twice," said Mr. Shattuck, "and I think that is enough for one man. There ought to be rotation in the office for the good of the club. I shall always take an active interest in its affairs, however, and will willingly do any committee work that may be given me."

The request of several manufacturers that the club give an endurance test for heavy trucks and commercial vehicles was laid before the governors. It was decided to reply to them that the matter would be discussed with the trade at the next auomobile show, and the form and dae of the test then determined. The reliability run and the lateness of the season will prevent its being held before next spring.

DELIVERING CARPETS IN NEW YORK.

Recent Incorporations.

Jersey City, N. J.—Eureka Automobile Co., with $400,000, to manufacture automobiles, etc. Incorporators—N. Metzenbaum, E. W. Schneider and C. J. Dorticus.

Newark, N. J.—The Cleveland Automatic Machine Co., with $1,000,000 capital. Incorporators—G. H. Kelley, G. C. Whitcomb, J. G. Russell and A. L. Garford.

Jersey City, N. J.—Novelty Motor & Engineering Co., with $100,000 capital, to manufacture motors, engines, etc. Incorporators—H. S. Gould, F. K. Seward and K. K. McLaren.

Binghamton, N. Y., automobilists are talking of forming a club. A meeting to effect an organization is expected to take place this week.

SPOILED THIER SPORT

Authorities Were Notified of Alleged Scorching Trip—Plans Called Off.

No small amount of ill feeling was caused last week by the proclaiming of an alleged plan to undertake a record breaking ride from this city to Atlantic City, N. J. The Automobile Club of America, through Secretary S. M. Butler, was the active party in the matter. It sent out warning notices to authorities of towns and villages along the route, detailing the circumstances and asking that the offenders be apprehended.

Either in consequence of the warning or because no such expedition was seriously contemplated, the date set passed without there being anything "doing." Zealous officials along the route were alert, but they had their trouble for their pains. No Red Devils or Green Serpents materialized, and no arrests were made.

Now the accused persons deny that there was any plan on foot to make the run. It had not passed beyond the talking stage, and probably never would have done so, they say. This being the case, the action of the club is regarded as both unwise and unwarranted, not to say impertinent. "As if there was not enough feeling against automobilists now," is the way one of the aggrieved ones put it.

The officials of the club show no signs of regret for their action, however.

They say that the run was really contemplated and that its action blocked it effectually. By this action, too, the club showed that it was now, as always, law abiding and opposed to violations of the highway laws.

The New York branch of the International Motor Car Co., 91 Fifth avenue, has been closed.

ANALYZED BY FIGURES

Highways, Canals and Railroads and Their Comparative Costs.

"Good roads are just as important as good canals," said W. L. Dickinson, vice-president of the New York and Chicago Road Association. "We spend money for canals, why not for good roads? Our 2,500 miles of canals are estimated to have cost $172,000,000. A bill is now pending for the appropriation of $28,000,000 more for the Erie Canal. In 1894 the total canal tonnage was 3,882,500, but it has been decreasing yearly since then. This tonnage, compared with the annual railroad tonnage, is insignificant. Every pound of this railroad tonnage has been hauled over a wagon road. What better argument do you want for good roads?

"The argument proves anything but convincing when analyzed by figures. Suppose a railroad one thousand miles in length carries ten million tons a year, and has freight stations every six miles. Suppose, even that it has no terminal business, but receives its whole tonnage from its 167 stations, evenly distributed. This would make an average haul of five million tons for the whole mileage and any part of it. From each station it receives sixty thousand tons, which have been carried over wagon roads from all parts of a territory of about 120 square miles. Figure the mileage of wagon roads required in each of these territories at forty miles, which is very low, and it is seen that forty miles of wagon roads must be supported from sixty thousand tons of goods, while six miles of railroad, running through the same district is supported from five million tons.

"With canals the case is very similar. They, like railroads, are arteries of commerce. To make an argument in favor of wagon roads out of this material would require that forty miles of wagon roads could be built at one eighty-third of the cost of six miles of railroad, or one mile of wagon road 553 times cheaper than one mile of railroad. If wagon roads could be made available for long distance hauling—as in those old days when most road systems in Europe were inaugurated—the case would be somewhat different. But this is an impossibility.

"Road building, viewed financially, is a purely local matter, and automobilism is not strong enough to make it otherwise. To connect the local roads and thereby create first a State road system, and eventually a national wagon road system, is a matter of luxury and convenience, highly commendable, no doubt, but in no wise an economical necessity. So long as bad roads constitute the only efficacious protection against high speed automobiles, and also a pretty fair guarantee of well built automobiles, there is not likely to be any widespread enthusiam for a for a cross continental system of billiard table roads.

"In the United States, as in South Africa and Australia, the automobile must earn its spurs on such roads as exist before any further awards will be decreed for it out of public funds. The worst roads must necessarily produce the best automobiles in the long run."

Wind as a Factor.

Air resistance is really the worst enemy the racing automobilist has to encounter. As high speed is reached the resistance of the air increases by leaps and bounds, every leap being greater than the last, until, as it has been aptly put, the "air becomes solid," and the object trying to pierce its way through becomes heated by friction against the air and deformed, just as a lead bullet is changed in shape when it passes through a substance which materially arrests its progress.

In La France Automobile a writer, M. Ravel, points out that extraordinarily fast times are mainly, if not wholly, due to the speed and direction of the wind.

M. Ravel calculated that in a motor car whose engine develops, say, 50 horsepower, the power is absorbed as follows, viz: Overcoming resistance of the air, 29 horsepower; overcoming resistance to traction, 9 horsepower; loss in transmission, 12 horsepower; total, 50 horsepower—showing that over 75 per cent of the effective power, and nearly 60 per cent of the total power, is absorbed by, so to speak, forcing back the air.

It is obvious, therefore, that under these circumstances a favorable or unfavorable breeze which moves the air in one direction or the other at a speed of, say, ten miles an hour, or, roughly speaking, five yards in a second, will make a difference in a record of nearly twenty miles an hour, for in the case of a contrary wind the automobile has to drive through an atmosphere coming toward it at ten miles an hour.

Works Harm to Tires.

One of the first things the user of pneumatic tires learns is that oil of any kind is exceedingly harmful to them. Its destructive influence on rubber is such that every precaution is taken to prevent their coming in contact.

The increasing use of live axles on cars seems to render more care necessary in guarding against this source of danger. Fixed axle bearings have not much tendency to distribute oil over the wheels, and though chains, if freely oiled, may do this, their free oiling is rather the exception than the rule, to the great benefit of chain manufacturers.

The live axle, on the other hand, carries a copious supply of oil or thin grease in its differential box, which often has a tendency to make its escape at one end or other of the axle, and, after lubricating the brake drum on the way, to spread in a neat radial pattern over the inner side of the tire. When this is wiped off the traces of its destructive action on the rubber are generally more or less visible.

MADAGASCAR'S FIELD

Local Conditions and Recent Tests Point to an Opening.

It has more than once been pointed out that the island of Madagascar is one eminently suited for the practical trials of automobiles. There are wide undeveloped regions without any railway communication whatever with each other, with the capital or with the ports on the sea.

Tananarivo, the capital, is situated in a mountainous region, in the centre of the vast island, and several days' march across arid deserts from the coast. It takes news a long time to reach Europe from General Gallieni, the military governor of Madagascar; and therefore it is only quite recently that letters from Captain Grüss have reached Paris giving details of some interesting automobile experiments that were inaugurated by the Governor General in May last.

General Gallieni left Tananarivo on the morning of May 10, piloted by Captain Grüss, and the next afternoon at 4 o'clock he reached Maevatanana, which is 350 kilometres distant from the capital of the island. The number of automobiles in the convoy was three, of which one was a brake of 12 horsepower and another a wagon loaded with baggage.

The road, despite the many obstacles encountered, was in excellent condition, and General Gallieni addressed a letter of congratulation to his responsible agents for the admirable state of repair in which the western road had been maintained. Captain Grüss having taken the general as far as Maevatanana, made his return journey to Tananarivo, which he reached on the following Saturday evening. He made his return over the 350 kilometres to the capital under similar conditions and with equal rapidity—the automobile journey being at the average rate of twenty kilometres an hour.

It should be observed that before the introduction of automobiles not less than an eight days' journey was required to go from Tananarivo to Maevatanana by the old methods of conveyance, locally known as "en filanzane." Of course, greater speeds than twenty kilometres an hour have been accomplished by the automobile; but when it is considered that Captain Grüss was obliged to traverse new and in parts rough roads, with three automobiles, one a heavy baggage wagon, the performance was a good one. It is doubtful if railways will pay in Madagascar—certainly not for many years to come.

The laying down of good roads is, of course, a necessary measure of development, and then the employment extensively of automobiles will largely enable the colonists to dispense with costly lines of railway. Madagascar, therefore, should be a fine field for the practical employment of the automobile for commercial purposes.

FOR SIGHT SEEING

Reduces the Cost to Tourists in a Provincial City by Four-Fifths.

"With the incoming to this sleepy old provincial city of more and more American tourists has come at last the automobile," writes a visitor to Charlottetown, P. E. I.

"It is itself a tourist machine, in fact as well as in name, for as the first horseless vehicle to win a place for itself far away from the large American centres in the north country, it is used here in the city as a cheap and rapid means for showing the sights. Its introduction was suggested by the constantly increasing carriage business done around 'the square'—every interest centres around 'the square' in Charlottetown—in taking visitors for a drive around the outskirts of the city, over the parkway along the shore of the bay, and back to 'the square' again by a route that shows something of the business activity of the place as well as the principal and more characteristic buildings.

"Such a drive with a horse takes an hour or more, and forms the basis for a charge of 50 cents for each person carried, and the carriages are surreys or carryalls, with seats for two or four.

"With the auto things are different. There are seats for ten passengers, four on each side facing inward and across the vehicle, and two on the seat in front with the driver. Instead of 50 cents per passenger the cost for a trip around town in the auto is only 10 cents; and instead of taking an hour or more in time, the auto enables one to see about all there is in twenty-five or thirty minutes.

"This auto has been in service now only about three weeks. Its owners style themselves the Charlottetown Automobile Co. and from the favor with which their enterprise has been so far regarded, they expect it to prove profitable. If there are people who wish to ride, the machine makes its little tour three or four times before noon, and perhaps six or eight times in the afternoon. On good days it has carried from two or three passengers up to ten on each trip, the best days for business being the two in each week when there is a steamer to arrive from Boston and Halifax.

"Disadvantages of the automobile here are two. It finds the peculiar crosswalks of Charlottetown streets a serious hindrance to fast speed, and it scares the horses. Streets in this old city are like country roads much broadened, and there is no pavement; consequently the flagstones set into the roadway at the street intersections come in time to be so much higher in level than the rest of the driving surface that a carriage load of people driving over them at any speed would be jolted frightfully, possibly with serious results. Such an occurrence is practically out of the question with Charlottetown horses, but with the auto the driver has to be constantly on the alert to slow down for crossings, with the result that his passengers not infrequently begin, after a time, to urge him to 'let her out a little.'

"But the Charlottetown chauffeur knows his business. With the horses the difficulty is the same as that met in large cities except that it is worse. Charlottetown horses appear loath to get used to the steam rival, and the progress of the rig, especially with the exhaust open, through the highways and byways of the town is marked by a series of balkings and shyings and other equine remonstrances. The auto meets these demonstrations by slowing down or stopping until the obstreperous horse is out of the way—another source of annoyance to passengers."

Kept Complete Figures.

Unusually complete data were compiled by W. H. Moore, a Watertown, N. Y., man, who, with his son, recently toured from that place to Asbury Park, N. J., and return via a circuitous route.

The tour occupied four weeks. The route led through Syracuse, Rochester, Elmira, Binghamton, Scranton, Pocono Mountains, Delaware, Water Gap, Asbury Park, Allenhurst, Rumson Road, Red Bank, Summit, Jersey City, New York, Albany, Schenectady and Utica back to Watertown.

The total mileage was 877; actual running time average 8 19-100 miles an hour; the fastest time for a continuous half hour run was 14 miles an hour, the slowest 3½ miles an hour; consumption of gasolene, 135 gallons, or one gallon for each 6.4 miles.

They were laid up for necessary repairs to pump one hour, and delayed but half an hour by heavy thunderstorm. This storm proved to be a blessing, as a miscalculation was made on water supply, which was made good during the storm from an eavestrough.

They estimate the condition of the roads 10 per cent fine, 20 per cent good, 50 per cent good average country roads, 10 per cent bad, and 10 per cent a disgrace to civilization. Mohawk Valley roads came in for a large percentage of the last 10 per cent.

A Winton touring car was used by the Watertown men.

Its Latest Crime.

As if the automobile has not been charged with crimes and misdemeanors enough, it is now held up as an alienator of a husband's affections. Dr. Milton B. Pine, of Chicago, is the offending husband, and his wife, Mrs. Fanny Uttley-Hunt Pine, has brought suit for divorce.

The defendant has two machines. Much of his time is spent automobiling up and down Michigan avenue, according to the complaint of his wife. But aside from transferring his affections to his automobiles, Mrs. Pine says her husband is cruel to her.

PROFITABLY USED

Gasolene Delivery Wagon so Successful That Another Will be Built.

Another attempt to use the automobile profitably in the delivery service for large department stores has been made this summer in Boston, and the single wagon in service has proved so successful and, what is more, so reliable, that this experiment may be reckoned as a considerable step in progress toward the thoroughly satisfactory commercial automobile.

It is a 5,000-pound rig, capable of carrying three tons, and is being tried by a firm that ran a large number of the old New-England Electric Vehicle Company's leased wagons when that company was in operation, and the firm is therefore able to give the best possible judgment regarding the relative efficiency of gasolene and electric motors. The firm's superintendent says:

"We are not saying anything against the electrics. They did our work for months, and did it in good shape, climbed the hills all right so long as there was anything left in the batteries, and made the long runs in good time. We have had it running on our long route out through the Newtons for eight weeks, and it has never had to be towed in once, or had a bad breakdown. It covers Newton, Newton Centre, Newton Corner, Newtonville and Auburndale—goes two miles beyond Norumbega Park every day—and takes some terrible hills out there without balking a bit. It has three speeds, two, six and fourteen miles per hour; and the driver has run it up a steep grade on Beacon Hill again and again at six miles without any trouble at all. They call it a twenty-horsepower engine, but it will develop more than that; twenty-five, anyway.

"The wagon has made fifty and sixty miles a day ever since we have been running it. Six horses couldn't do the work it does and cover the territory it covers. We've had two tons on it all right, and it often carries a ton and a half; and it gets over the ground, hills and all, as well as when it runs light. We have had a cyclometer on it for three weeks, and the figures were 914 miles when it started out this morning. It's almost more powerful than we need. We are having built a second wagon of the same sort, which will weight about 3,500, and have a little smaller motor. I was anxious for plenty of power. I didn't want the thing to fail, because of too little power; but the first wagon has too much, if anything. There is very little noise or vibration to it, though. You can set a pencil on end on it while the motor is running, without having the vibration knock it down. When the wagon is out on the road it makes almost no noise at all, very little more than the electrics. It hasn't scared any horses, we've had no complaints, and no letters sent in, or anything of the sort. It is doing well."

Digitized by Google

WINTON AND CANNON.

(Continued from page 7.)

able. It was made more than ever apparent that the maintenance of permanent interest in automobile racing is dependent upon an improvement in the respects mentioned.

Of the management it is only justice to say that it was entirely satisfactory. The first race was called promptly on time and throughout the afternoon the waits were no longer than was rendered necessary by the scantiness of the entry list.

Six vehicles came to the wire for the two mile race for electrics, viz., four Waverleys, a Buffalo and a Neftel. The last named, driven by Knight Neftel, proved itself easily faster than the rest, and had a long lead when it passed under the wire in 4:23. W. G. Titcomb's Waverley was second, C. F. Peckham's Waverley third.

In the three mile race, for steam stock carriages, the winning vehicle proved to be a Toledo, with a Stanley and a Locomobile in second and third positions. In the second mile the Toledo, which had been husbanding steam, let out and pulled ahead, overtaking both the others and finishing first, giving the spectators their first taste of sport. The time was 5:09 1-5.

With the events as an appetizer, Alexander Winton was next given the track. In his "Bullet," fresh from its Cleveland triumphs, he essayed to establish a new ten mile record.

An ovation but little short of that given Fournier last year greeted the famous driver and his car. Every one seemed to know that the event of the day was about to take place, and the long, low car, with its rakish lines, was keenly watched. At the start it looked as if, in spite of Winton's fear of the track, which has but little banking, a sensational performance would be recorded. The mile was covered in 1:06 1-5—better than Fournier's fastest—and the next was 4-5 faster. From then on, however, the speed slackened steadily, until, when six miles had been covered, the attempt was given up, owing to the roughness of the track and the difficulty of making the turns.

As it was, however, the five mile performance was better than any yet made. The comparison with the records made at Cleveland on September 16 is as follows:

	Providence.	Cleveland.
First mile	1:06 1-5	1:20
Second mile	2:11 3-5	2:23
Third mile	3:17	3:25¾
Fourth mile	3:25	4:28½
Fifth mile	5:30 3-5	5:31¼
Sixth mile	6:39 2-5	

The next event, a five mile race for light gasolene carriages, proved to be almost a walkover for a Stevens-Duryea car, it winning easily in 7:42½. An Oldsmobile was second and a Knox third.

The steam car built by George C. Cannon was next given a chance to distinguish itself against time, its two man control barring it from the competition events. Manned by Cannon and his chum, Marseilias, it made the fastest mile of the day, 1:05¼, although its five mile time in a subsequent trial was behind Winton's, being 6:05. Cannon and his odd appearing car, with its huge smokestack, got a reception only second to Winton. Its fast mile cinched the hold it possessed on the spectators.

The best real race of the afternoon was the one which brought together five Winton touring cars for five miles, with well known owners as drivers. There was George H. Merrill, jr., of Norwood; Frank Townsend, J. B. Mills, George Otis Draper, of Hopedale, and Fred Tudor, jr., of Boston. Mills took the lead when they finally got away. He kept it for two miles, with Draper a good second and Tudor holding back comfortably at third, Townsend fourth, and Merrill fifth, with his machine running poorly. On the third, Tudor began to creep up on Draper, to the great delight of the spectators, and as the two rounded into the backstretch they could be seen gliding along at high speed, neck and neck, for some distance. At the half mile Tudor had forged ahead, and on the fourth he gradually overhauled Mills, finishing in fine style almost an eighth of a mile to the good, amid great enthusiasm from the grand stand. Mills was second and Townsend third. The time was 9:13¾.

A five mile race for heavy gasolene cars, limited to thirty horse power, gave Percy Owen a chance to bring out Winton's light racer, called the "Pup." He had against him two Wintons, a Stearns and a Darracq. Owen was an easy winner, in 6:25¾.

Owen was leader again in a free for all race for gasolene cars, five miles, in which the contestants were Winton, with his big racer, and Harold Brown, in his Darracq. Brown, with his tonneau, had no show at all against the racers, stripped of all trappings, and Winton's "Bullet" was not in its best form. Owen's time was 1:25½, 2:40, 3:55½, 5:12, 6:43½. He did better in the sweepstakes for winners, in which he was practically the only starter. His time then was 1:19½, 2:32, 3:46, 5:00½, and 6:14¾, a record for 2,000 pound gas cars.

After the races the visiting automobilists were entertained at an informal smoker and "feed" at the Crown Hotel, the local club's headquarters.

The summary follows:

Motor Bicycles, Five Miles—Won by Indian (George M. Holden); Orient (John M. Farr), second; Orient (F. W. Godfrey), third. Time, 7.34.

Electric Vehicles, Ten Miles—Won by Neftel (Knight Neftel); Waverly (W. G. Titcomb), second; Waverly (C. F. Peckham), third. Time—One mile, 2.17; two miles, 4.23.

Steam Vehicles, Stock Cars, Three Miles—Won by Toledo (A. L. Lee); Locomobile (W. Hinscliffe), second; Stanley (W. H. Talbot), third. Time, 5.08.

Exhibition by 50 horse power Winton Bullet, operated by Alexander Winton—One mile, 1.06½; two miles, 2.12fff; three miles, 3.18 4-5; four miles, 4.25; five miles, 5.30 3-5; six miles, 6.39 2-5. The figures for four and five miles are new world's records.

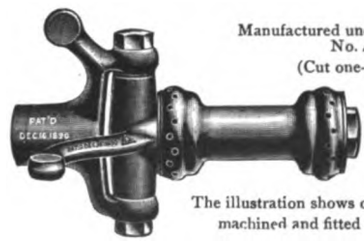
Gasolene Vehicles, Under 1,000 Pounds; Five Miles—Won by Stevens-Duryea (J. F. Duryea); Oldsmobile (D. B. Huss), second; Knox (George Reed), third. Mile times—1.38¾, 3.09fff, 4.39¾, 5.11¼, 7.42½. All new records.

Exhibitions by Cannon Ball Steam Vehicle, operated by George C. Cannon and Thomas Marsalis—First trial, one mile, 1:05¼. Second trial, five miles. Times, 1.21½, 2.26¾, 3.41½, 4.54, 6.05.

Special race for Winton touring cars, driving parts to be alike, five miles—Won by F. Tudor, Jr.; J. B. Mills, second; Frank Townsend, third. Time, 9.13¾.

Gasoline vehicles, weighing over 1,300 pounds, limited to 30 horse power, five miles—Won by Winton Pup (Percy Owen); Stearns (George Weed), second; Winton (F. Tudor, Jr.), third. Mile times—1.25, 2.40fff, 3 55¼, 5.10¾, 6.25¾. New records for the class, except first mile.

Gasoline Vehicles, Free-for-all, Five Miles—Won by Winton Pup (Percy Owen); Winton Bullet (Alexander Winton), second; Darracq (Harold H. Brown), third. Time, 6.43½.



Sweepstakes (winners and seconds in previous events), Five Miles—Won by Winton Pup (Percy Owen); Toledo (A. L. Lee), second. Mile times—1.19½, 2.32, 3.46, 5.00½, 6.14¾. New records.

Motor Bicycles, Special, Five Miles—Won by Orient (John Ruel); Orient (L. P. Callahan), second; Orient (Russel M. Dana), third. Time, 6.50½.

INSPECTING THE ROADS

Highway Commissioners Find Motor Vehicles Quicker and Less Expensive Than Horses.

What was probably tne longest inspection tour ever completed in Massachusetts was taken not long ago by Highway Commissioners McClintock and Parker to look at the condition of the State roads that have been constructed within the past year on the line of the old Troy and Boston turnpike, and one of the interesting things about the trip was that they made it in an ordinary steam automobile, instead of with horses and carriages. More than that, they came back to their offices almost enthusiastic over the machine as a time-saver and money-saver in road work of that sort.

They started from North Adams one Monday morning, with a chauffeur and one of their own district inspectors in the front seat of the vehicle, and proceeded eastward; they made the whole distance back to Groton, including a number of side trips to roads lying somewhat off the direct line, in time for them to reach Boston by train for evening dinner on Wednesday. A three-day trip! And by the old method of going up each day by train and working out from the railroad by means of a carriage and double hitch of horses, the commissioners say it would have taken fully nine days to accomplish what they did with the auto in three.

Roads in thirty-two towns were inspected, and the automobile journey involved a run over Hoosac Mountain with a grade averaging ten per cent for two miles and a rise of 1400 feet vertically, as well as a run over Northfield Mountain, from Northfield to Irving, where the road is rough and undergoing repairs. The vehicle climbed everything, and made its way over the uptorn sections of the road as well or better than a horse. Just how many miles were covered would be hard to say, but on the direct route the trip included North Adams, Charlemont, Buckland, Greenfield, Montagu, Irving, Orange, Athol, Phillipston, Templeton, Gardner, Westminster, Fitchburg, Lunenberg and side trips took in Shelburne, Buckland, Ashfield, Deerfield, Whateley, Colrain, Northfield, Ashby, Townsend, Groton, Leominster and Lancaster.

Commissioner McClintock said of the comparative cost of the automobile and horses: "Our whole trip, including the charges for the machine and for hotels, cost inside of $75. If we had used horses the numerous teams we should have had to hire and the greater amount of travel by railroad, and the fact that nine, instead of three days would have been required, would have made the tour cost well toward $200. With horses the cost over the highways would have been twice what the automobile cost, I should say, and the cost of railroad fares in the old method would have been three times the cost of automobile transporaion. The hotel charges, of course, would have been tripled. More than that, the run through the country in a swift machine was a pleasure, compared with a trip by horses, and the peculiar characteristics of the automobile make it naturally a good detector of bad road. Moving quickly along a road in the machine, it is possible to tell by the feel of the road and the motion of the vehicle where even the slight defects are located. With horses there is always a side-motion to the vehicle, which deceives you, if you are trying to tell what the road is like by the motion, and it is necessary to depend on sight almost altogether. The automobile used was of 4½-horse-power, of surrey pattern, with a folding canopy which, in case of rain, could be put up in such a way that it formed a regular carry-all top. We hired the machine at Worcester, and it was run up to North Adams over the road. There would be no economy in having the commission purchase a machine for its inspections, for the reason that the machine would have to be shipped about all around the State in order to have it on hand when and where it would be needed. If we hire, we have a machine handy practically all the time."

The Commissioners made several shorter trips with an automobile earlier in the season, notably one over the Lowell series of roads, to determine on the need of development by the State, and another down through Essex County, and they were much impressed then with the machine's good points. This last trip, longer and in places tremendously hilly, seems to have established the horseless carriage permanently in their good favor.

Some Racing Expenses.

Automobile racing comes high when it is pursued on the Winton scale. For expressage alone the two Winton cars—the Bullet and the Pup—have cost their owners $500 in a single week. For example: The cars came to Detroit from the Cleveland meet, but the races were postponed. They were shipped back to Cleveland the same night and then expressed to Providence, R. I. Next they will be sent to Joliet, Ill., and then to Detroit again.

Though Sleeping Car Line to Grand Rapids, Mich.

A Pullman Sleeping Car of latest construction is now attached to New York Central train leaving Grand Central Station at 4:00 p. m., daily, running through over the Michigan Central Station, arriving at Grand Rapids at 12:55 p. m., next day, connecting in Union Station for all points in Western Michigan. For information and sleeping car reservations inquire of New York Central Agents. ***

HISTORICAL STEAM RELIC

Examination Reveals a Piston Slide Valve and Ingeniously Simple Contrivances.

There is in a London depot an historical relic of the greatest interest and importance—no less than a model of the first locomotive ever made and run in England. It was invented and constructed by William Murdock, the well known assistant to James Watts, who, second only in importance to Watt, who, second only in importance to connection with steam engines, among others the "D" slide valve and the "sun and planet motion."

The date of construction is not definitely known. Mr. Murdock's son, when living at Handsworth, informed Dr. S. Smiles that this model was invented and constructed in 1781, but, after perusing the correspondence of Boulton and Watt, Dr. Smiles has inferred that it was not ready for trial until 1784. The engine had been continuously in the possession of the Murdock family till 1883, when it was purchased from Murdock's great grandson by Sir Richard and George Tangye.

An attentive examination of the model well repays one, and reveals many beautifully simple contrivances, showing Murdock's genius for the adaptation of simple means to secure his desired ends. The height of the small locomotive is about 14 inches, its length 19 inches, and the extreme width over the driving wheels is 7 inches. It consists of an oblong board, mounted upon three wheels—two driving wheels at the rear attached to a cranked axle, and one steering wheel in front arranged under the board and running in a swivelling fork, which can be set by a tiller handle above. Behind the driving wheels is the boiler, which is a rectangular vessel 3⅜ inches high, 4¼ inches long and 3⅛ inches wide, constructed of brazed copper. Through the boiler a flue passes obliquely, contracting from a circular chamber forming the firebox to a small funnel in the top of the boiler, which serves to carry off the products of combustion from a spirit lamp arranged to burn within the firebox.

The steam cylinder of the engine is mounted on the top of the boiler, and the lower part passes into it, and is surrounded by steam. The piston rod passes upward, and is attached to the end of a vibrating beam; this beam passes to the front of the carriage, and is pivoted in an upright pillar. The little engine is worked by the expansive force of steam only, which is discharged into the atmosphere after it has done its work of alternately raising and depressing the piston in the cylinder. The diameter of the piston is three-quarters of an inch, and

Digitized by Google

the length of its stroke is about two inches. As the piston moves up and down it causes the beam to rotate the driving wheels, by means of a connecting rod attached to the cranked axle.

The steam valve is very ingenious, and it is driven from the beam by a projecting rod, so arranged that the valve is moved at the termination of every up and down stroke by the last portion of movement of the beam upward and downward. It is a piston valve with two pistons, ground to work easily, but pressure proof, in the valve cylinder. The space between the pistons is in constant communication with the boiler, and the steam is admitted by two ports—one at the top and one at the bottom of the cylinder—so arranged that when the piston valve is up the steam enters the upper port and drives down the piston, while the exhaust steam from the under side discharges from the cylinder by the lower port into the air through a tube connecting the two pistons of the valve.

This is probably the earliest (piston) slide valve used in a steam engine, as at the date of its construction Boulton and Watt did not use Murdock's "D" slide valve in their engines, the patent for the latter not being taken out by Murdock till 1799 (Patent No. 2,340), about fifteen years later. In this model the idea of the slide valve had certainly entered Murdock's mind.

The safety valve is let into the boiler near the steam cylinder, and it is held down by a little tongue of metal—a very efficient and simple contrivance. A leaden weight is placed above the steering wheel to balance the machine and to prevent it tipping over when the water is in the boiler. The wheels are constructed of brass tube brazed together. Every part of the engine is both well designed and well made. It is interesting to notice that at some time the wood under the boiler has been on fire, and it still shows the marks of charring. It has evidently been pieced and protected by an iron plate to prevent a similar mishap.

Making Aluminum Castings.

To make aluminum castings the alloy should be melted in a plumbago crucible, using charcoal fuel. Before placing the aluminum in the pot it should be dipped in benzine or paraffine oil. The metal is covered with powdered charcoal, and care must be used not to heat too much; if it shows a dull red it is overheating. Aluminum is a difficult metal to cast sound. Nitrate of potash stirred well in with the molten metal assists in cleansing from impurities. The mould must not be rammed too hard, and if cored work is being cast the cores must be made very carefully—in fact, only a skilled coremaker can successfully make cores for aluminum castings. The reason of this is, of course, due to the great contraction of aluminum. Likewise, if the castings are any size or length, care wyill have to be taken that they do not sear in the mould. The castings should always be taken out immediately they are set.

GET ALONG TOGETHER

Must the Automobile and the Horse—Good Sense Only Needed.

"At the present time, when the general public, the drivers of horses, farmers and automobile clubs are showing a lively interest in all such measures, actual or proposed, as have to do with the safety of our thoroughfares, urban, suburban and rural, the question of the teachableness of the horse becomes of importance," say a contemporary.

"The horse and the horseless vehicle have to get along together. Is there any essential reason why the patrons of one should hate the patrons of the other form of locomotion?

"An English suburban doctor of wide experience lays down the fundamental theory that horses and automobiles are on a par in this, that neither should be in the hands of persons who cannot control them. He says: 'I hold no brief for the motor car. I am passionately fond of horses, and merely look upon a car as a convenient and rapid means of locomotion; but I was taught as a boy, and have had ample opportunities of verifying the lesson, that horses may be broken to anything; also that it was the owners' duty to educate them to face the ordinary trials of the road. Now, any horse may, in a very short time, be taught to eat off the noisiest and smelliest motor car in existence. What right, then, has an owner of horses to go about the public highways with an animal that is admittedly a danger to himself and others?'

"There was the same sort of excitement as at present when the roads north, south, east and west were covered with bicycles. There were accidents. But after a while the horses got accustomed to what had been a mystery to them. The authority just referred to holds that most of the automobile mishaps are due to the communication of the driver's fears to the horse. 'It is a matter of daily notice to every horseman that most horses would face motor cars boldly enough if only their driver's panic-stricken hands would let them; and it seems the acme of absurdity that such incompetents should vaunt their dangerous incapacity and imagine that their wish to travel behind half trained, and therefore unsafe, animals should be allowed to cripple a great industry.'

"With the horse familiarity breeds contempt: 'One mistake constantly made by drivers is to fancy that horses are frightened by the speed at which anything approaches them. Horses fear and dislike anything to which they are not accustomed, but once get them used to the sight and sounds of the motor car and it matters little whether it comes at five miles an hour or fifty. A very few drillings with a motor car, and, if necessary, Galvaine's tail rope, will teach any horse that there is nothing to fear; and, after his lesson, if he shy, it will be because his driver has shied first.'

"All that is necessary is to train up a horse in the way that he should go, and whenever an imported racing machine comes along he will not depart from it. Wise horsemen are accepting this view. It is a much more rational thing to do than to kick against the inevitable."

Mount Washington Record.

Seven hundred miles in eight days, with a record breaking ascent of Mount Washington as a part of the tour, was driven by D. W. Comstock, an Ivoryton, Conn., man recently. He left Ivoryton, and passing Hartford, reached Boston, a distance of 137 miles, the same day. From Boston he went from Portsmouth, N. H.; thence to Portland, Me., and then by way of North Conway to the old Glen House. He returned from Mount Washington by way of Bethlehem, Profile, Plymouth and White River Junction; thence following the Connecticut River back to Ivoryton. The trip from Bellows Falls, Vt., to Ivoryton, about 140 miles, was made in one day.

The run from the old Glen House to the top of Mount Washington was made in less than fifty minutes. the distance being eight miles and the rise 5,000 feet. Breakfasting at the summit, Mr. Comstock made the return immediately, in order to avoid teams. The descent was made in forty minutes.

The average time consumed by a team in making the ascent by the same road is from three and a half to four and a half hours. This was the seventh ascent of Mount Washington by automobilists, and by far the quickest.

Licensing not Infallible.

"The French system of licensing the driver, which has been held up as a sure preventative of accidents by some journals, is not infallible," says an automobilist who has driven much in that country.

"The fact that a man is licensed in France to drive simply means that he has a working knowledge of the handles to be moved, and a slight acquaintance with the general mechanism. The only real guarantee of safety is common sense, and an instinct of caution, assisted by a natural or acquired aptitude of judging distance and speed. No government examination or regulations in the world can give these qualities.

"On the other hand, we should not become alarmists about motor car accidents, for they are very few and far between, taking into consideration the number of miles run. No one would think of giving up railway travelling because a bad collision or derailment occurred, and the general public should remember that motor car accidents are rare compared with disasters to horse drawn vehicles. In the hands of an average man of sense a motor car is as safe, as, if not safer than, any other vehicle."

The Week's Patents.

709,483. Tire and Fastener for Vehicle Wheels. Jacques C. Haines, Chicago, Ill., assignor of two-thirds to William E. Huber and Chester Haines, Chicago, Ill. Filed March 10, 1902. Series No. 97,392. (No model.)

Claim.—1. A tire fastener comprising a channel rim, an elastic tire within the channel of said rim, a series of fastening members partially embedded in the tire and projecting therefrom, adapted to be brought into contact with the bottom surface of said rim, and binding wires engaging and adapted to draw said projecting portions into contact with the bottom surface of said rim.

709,485. Induction coil. John O. Heinze, Jr., Revere, Mass. Filed July 11, 1902. Serial No. 115,160. (No model.)

Claim.—1. An induction coil made up of two or more separate magnetic cores; a primary coil surrounding the said cores and having as many sections as there are cores; a continuous insulating mass surrounding said primary coil and cores; a secondary coil wound about said insulating mass, and consisting of as many sections as there are cores or sections in said primary coil.

709,546. Vehicle wheel. George S. Lee, Hawthorne, N. J. Filed January 27, 1902. Serial No. 91,408. (No model.)

Claim.—1. The combination with a hub, spokes and rim rigidly connected together, of a pneumatic tube on said rim, a tire on said rim adapted to have an eccentric curvilinear motion around the rim within a limited range to compress said tube, and stops on the rim to limit the range of motion of the tire.

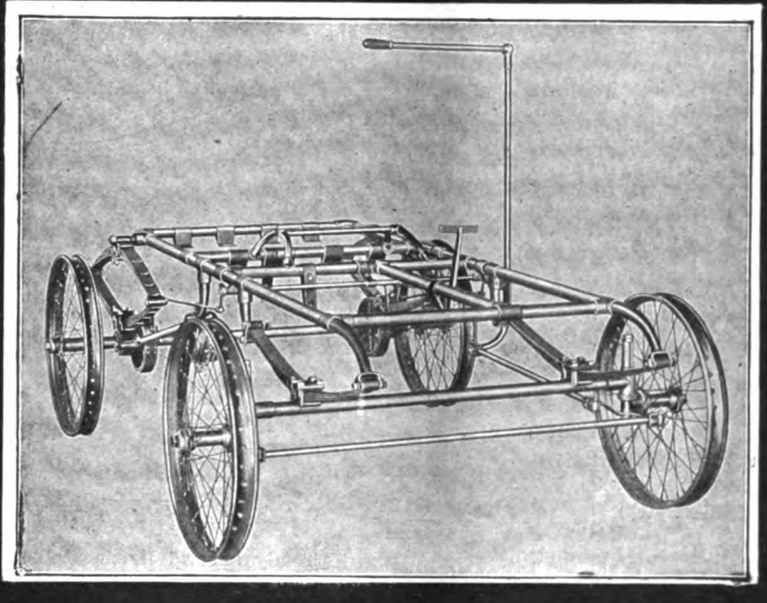
709,598. Electric Igniter for Explosive Engines. Howard A. Gray, Plainfield, Ill. Filed October 1, 1901. Serial No. 77,210. (No model.)

Claim.—1. In an explosive engine, in combination, a cylinder, a pair of intermittently contacting igniting electrodes one of which is rotable, means for rotating said electrode, a charge controlling valve, means for actuating the valve, a governor for interrupting the action of the valve, and an adjunct of the valve-actuating means engaging the electrode-rotating means to hold the rotatable electrode against movement.

709,611. Secondary Battery. William L. Silvey, Dayton, Ohio. Filed February 8, 1902. Serial No. 93,175. (No model.)

Claim.—1. In a secondary battery the combination of a battery plate having supporting ears with a lug on one of the ears, a bolt passing through the lug and provided with a screw-thread, a nut for clamping the bolt to the lug, an equalizing bar, the bolt extending into the equalizing bar and nuts for clamping the equalizing bar and the bolt together independent of the lug as set forth.

709,655. Method of Superheating Steam. Hosea Webster, Montclair, N. J. Filed December 12, 1901. Serial No. 85,554. (No model.)



Claim.—1. The method herein described, consisting in superheating steam, primarily by the heat of the combustion in the generator, and then augmenting the temperature of the steam superheated, by a separate and independent source of heat, as set forth.

709,681. Safety Device for Motor Vehicles. Andrew L. Riker, New York, N. Y., assignor, by mesne assignments, to Morton Trust Company, trustee, a Corporation of

HERCULES RUNNING GEARS

FOR ELECTRIC AND GASOLINE VEHICLES

There are no weak spots in these gears. Don't confound them with gears which have been hastily constructed to meet an early demand from automobile makers.

We also solicit orders for parts of these gears. Their design is original and the construction is sound. Prices and particulars of construction sent upon application.

FEDERAL MANUFACTURING COMPANY

SMITH STAMPINGS FACTORY

Milwaukee Wisconsin

Digitized by Google

New York. Filed March 2, 1900. Serial No. 7,119. (No model.)

Claim.—1. In a motor vehicle, a motor, a driven road wheel, intermediate transmission mechanism and a clutch between said transmission mechanism and the motor, means under the control of the occupant to apply and disconnect the clutch to propel the vehicle, and automatic means to release said clutch upon rising of the occupant from the seat of the vehicle.

709,682. Rotary Slide Valve for Pumps, Compressors or Motors. Louis Roedel, Passaic, N. J. Filed March 24, 1900. Renewed June 10, 1902. Serial No. 111,006. (No model.)

Claim.—1. The combination, with a stationary cylinder having interior inlet and outlet channels, of a rotary slide valve at the head of said cylinder, a shaft connected at one end with said valve, means for imparting rotary motion to said shaft, and a balancing device arranged at the opposite end of said shaft, substantially as set forth.

709,684. Steering Device for Automobiles. Gustav R. Schlumberger, Allegheny, Pa. Filed February 21, 1902. Serial No. 90,696. No model.)

Claim.—In a steering apparatus of the type set forth, the combination of a vehicle body and a cross piece carried thereby with hollow standards interposed between said vehicle body and cross piece, rods turnably secured within said hollow standards and carrying collars at their upper ends engaging the vehicle body, right angular extensions rigidly secured to the lower ends of said rods and engaging the under face of the cross piece, sleeves formed integral with the depending portions of said extensions with wheeled axles mounted in said sleeves, the inner ends of said axles extending beyond said depending portion of the extension and carrying knuckle joints and a connecting rod secured to the upper rods, substantially as described.

709,690. Variable speed and Reversing Gear. Henry J. Westover, Mount Vernon, N. Y., assignor to H. Ward Leonard, Bronxville, N. Y. Filed August 30, 1901. Serial No. 73,778. (No model.)

Claim.—1. In a variable gear, the combination with the driving and driven shafts, of a clutch for making direct connection between said shafts, a lower speed gear for connecting said shafts around said clutch, a lever for shifting one member of said clutch, a cam for controlling the movements of said lever, and a shifting mechanism for placing said lower speed gear into and out of mesh with the driving and driven shafts, substantially as set forth.

709,719. Steam Engine. Agricole P. Moresi and Henry J. Bergeron, Jeanerette, La. Filed April 30, 1902. Serial No. 105,365. (No model.)

Claim.—1. A steam engine embracing a revolving piston cylinder, a crank, whose axis is eccentric with the axis of said cylinder, a bent arm connection between said crank and the piston rod of said cylinder, said arm connection having its bent or right angled terminal connected radially to said crank, and means for supplying pressure to said cylinder, substantially as set forth.

709,838. Means for Preventing Road Vehicles from Slipping Sidewise. Edmund T. L. Williams, London, England. Filed July 22, 1902. Serial No. 116,570. (No. model.)

Claim.—1. A device for the purpose specified, comprising a roller having a conical running surface, a sharp edge at the end of said conical surface, a bearing for said roller, and a swing arm carrying said bearing, substantially as described.

Experimenting With a Horse.

This is the story of an automobile and a horse, and it will occasion little surprise to learn that the former came out second best. As a matter of fact, no other result could be looked for, now that the motor vehicle is admitted to be a "good mark" for everybody who wants to take a shot at it.

"The horse had long trod nervously under the modern blight of its race, the ignoble fear of automobiles. Every time the animal saw one of the vehicles it appeared to be suddenly smitten with a species of fence or tree climbing madness. The mere sight of an automobile in its most quiescent state inspired the animal with fear.

"His owner determined to rid his horse of its foolish fear, and he concluded that the best way to do it was to introduce the horse so some representative automobile and get the animal thoroughly broken. The introduction was pulled off according to schedule, but it wasn't the horse that was broken. A friend offered his new automobile as an object lesson. The horse was taken close to the machine for a long look. He gave it the look at close range, and then rose into the air like another Pegasus.

"When it came down it came down on the automobile, and then began a kicking match in which the automobile realized its utter horselessness. The horse landed on one of the front wheels and the tire burst with a report like a cannon shot. Then it turned around and brought both hind feet into play. The automobile was whacked and banged and slammed around till it was a wreck, and the experiment was over."

Horses Have Limitations.

Already shrewd livery stable men object to hiring a horse to drivers who are used to employing automobiles for their outings. The liverymen's explanation of their avoidance of automobile trade is simplicity itself. They say that when a man has become accustomed through the use of a motor vehicle to have almost unlimited speed and power at his command at all times, he forgets when he returns to driving a horse that muscles cannot stand what motors can. Unconsciously the automobilist forces the animal to keep a speed and to go a distance which it cannot do with safety. The wise liverymen know this, hence their disinclination to intrust the animal to the unthinking motorist.

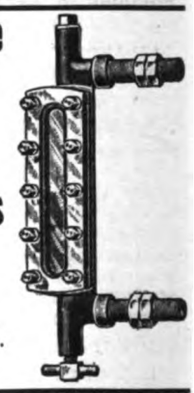
The Week's Exports.

British Possessions in Africa.—Thirteen cases auto vehicles, $7,426.

Copenhagen.—Three cases auto vehicles, $1,050.

Japan.—Thirty-six cases motors, $3,096.

London.—Two cases motor vehicles and parts, $946.



Santander.—Two cases auto vehicle parts, $329.

VICTORIOUS AT HOME AND ABROAD.

The White Steam Carriage

WINS OUT IN ENGLAND'S RELIABILITY CONTEST.

True to its former showing made in this country, a WHITE STEAM CARRIAGE completed the 650 miles test with

AN ABSOLUTELY CLEAN RECORD,

being one of two out of seventy entries to achieve this distinction.

The conditions of this run were unusually severe, the competing vehicles being required to make five separate journeys over different routes, and submit to brake contests and hill climbing trials.

The WHITE STEAM CARRIAGE used was a six horse power vehicle taken from stock and not only scored

1800 POINTS OUT OF A POSSIBLE 1800,

but demonstrated its fuel economy by using only 13 quarts per day.

Both its track records for speed and its road records for reliability prove that

THE WHITE IS A THOROUGHBRED.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.

Volume V. New York, U. S. A., Thursday, October 9, 1902. No. 2

BOSTON HEGIRA BEGINS

Eighty Entrants for This Mornings Event in Hand—Everything in Readiness.

Arrangements for the Reliability Contest of the Automobile Club of America are practically completed and everything is ready for the start, which takes place at 9 o'clock this (Thursday) morning.

The work of weighing and sealing the cars and suppling them with their numbers were begun Tuesday and continued all day Wednesday. The owner of each car was required to report at the club rooms, Fifth Avenue and Fifty-eighth street, and undergo these necessary preliminaries. Some few changes in classification, owing to excessive weight, will probably be made, but at this writing it is impossible to say how many cars will be thus affected.

Two additional entries have been accepted, which brings the total up to 80. The entries referred to are an Oldsmobile, entered by H. B. Shattuck & Sons, and a Fournier-Searchmont, entered by Whitney Lyon. It is expected that there will be very few, if any, non-starters, and that the number of these will be almost the same as it was in the Buffalo run of last year.

Secretary Butler of the club returned a few days ago from a last trip over the route. He made the final arrangements for the control of stations, the marking of the course with the different colored flags, noon-day and night stops, etc.

Observers have been assigned to all the cars. The applications for these posts largely outnumbered the vehicles entered, and a number of persons were disappointed. The committee in charge of the run, Messrs. Scarritt, Chamberlin and Hill, made the selection, which was not by lot. Members of the club have, in a number of cases, been selected for these duties.

Each driver and each observer will be supplied with an official program. This is contained in a carefully compiled and well-printed book, similar in shape and make-up to the program of last year. It contains complete instructions for the contest, maps of the route, lists of hotels and repair and supply stations, itinerery, maps, etc., together with a number of ruled pages designed to contain the official reports of the observers. The book is a veritable vade mecum, and with it in his possession no driver can well go wrong or be at a loss.

The tour will consume seven days, six en route and a day of rest at Boston. New Haven, Springfield and Boston are the night controls on the outward trip, and Springfield and New Haven on the inward one.

Some twenty automobiles took part in a parade and run of the Automobile Club of Hartford, Conn., on Saturday last. New Britain was the destination of the party, dinner being taken there and the return made in the evening.

Daimler Will go to Bayonne.

It is authoritatively announced that the Daimler Mfg. Co., Long Island City, N. Y., has purchased land at Bayonne, N. J., and will remove its plant there.

Rumors that such a move was in contemplation have been in circulation for some little time. Upon inquiry made of the company, the Motor World was informed that there was no information to be given out at the present time. On Thursday last, however, the Board of Directors met and decided to make the purchase, negotiations for which had been in progress between its owner and President Allen of the Daimler Co.

"The intention of the company is to remove its plant from Long Island City as soon as the required changes can be made, and manufacture automobiles and launches at the new location. The necessary buildings will be commenced in due course," said President Allen, in reply to the Motor World's inquiry.

Originator Will Retire.

Edward A. Archibald, president and manager of the Archibald Wheel Co., Lawrence, Mass., has sold his entire interest in the concern and will retire from business. The Archibald Co. was the originator of the celebrated artillery wheel, now so much used on automobiles. Mr. Archibald was the founder of the company and the inventor of the wheel.

BASEMENT FILLING UP

Diagram Ready and Applications Being Received by Garden Management.

As the Motor World last week stated would be the case, the Madison Square Garden management has added the basement of the building to the space given for exhibition purposes. The area has been marked off and a diagram showing the spaces offered for sale prepared. The spaces number twenty-six, and of these applications for six have already been received.

It has been decided by the management to reconsider its decision not to admit motor bicycles to the show. A strong protest was made against this rule, and the result has been its withdrawal. Space owners will be permitted to exhibit machines of this kind, just as they were at the two previous shows.

Eleven additional entries have been received since last week. They are as follows:

Rose Manufacturing Co., Philadelphia, Pa.
G. & J. Tire Co., Indianapolis, Ind.
Twentieth Century Manufacturing Co., New York.
Ajax Motor Vehicle Co., New York.
General Automobile and Manufacturing Co., Cleveland.
Auto Supply Co., New York.
Lane Motor Vehicle Co., Poughkeepsie, N. Y.
R. E. Dietz Co., New York.
Champion Manufacturing Co., Brooklyn.
H. H. Franklin Manufacturing Co., Syracuse, N. Y.
Buckmobile Co., Utica, N. Y.

Absorption in Logansport.

A consolidation of the Rutenber Mfg. Co. and the Logansport Foundry Co., both of Logansport, Ind., has taken place. A new company, under the name of the Western Motor Co., has been formed, with $400,000 capital, and it has taken over both the older concerns. It is stated in the incorporation papers that $125,000 was paid for each.

WAR OF THE VELOS

Rival Hill Climbs Promoted by These Journals—Deauville Timing Muddle.

French Bureau Motor World,
2 Rue d'Abbeville.

Paris, Sept. 26.—If competition has a stimulating effect upon business it is capable of making a pretty mess of automobile events, to judge from the poor results of the Gaillon hill climbing tests on Sunday last. The competition was first organized four years ago by the Vélo, and it at once took rank among the biggest tests of the year, but since that time things have undergone a good many changes, including the influence of the organizing journal itself, which no longer enjoys the monopoly of representing the automobile interest. The Vélo made the mistake of running in opposition to the Automobile Club and of publishing its celebrated manifesto against automobile racing, with the result that it was found necessary to provide an antidote against the ravings of this paper, and the Auto-Vélo sprang into existence, under the ægis of the Automobile Club. This latter journal has been conscientiously dealing sledge hammer blows at its ancient rival, and has in fact "jumped its claim" by forestalling the Vélo in the organization of tests, so that the different events which were inaugurated by the older paper have been passing into the hands of the new one. The climax has just been reached in the matter of the Gaillon tests. The Vélo announced them in the usual way for October 5. The Auto-Vélo then set to work to promote tests on the same day at Chateau-Thierry and another test at Gaillon the following Sunday, so that while it was hoped to draw custom away from Gaillon to Chateau-Thierry, it was intended to show that the real Gaillon test was the second one under the management of the Auto-Vélo. It looks as if this journal has succeeded in its attempt.

After what we had been accustomed to in former years, the lack of support given to the Gaillon meeting was very disappointing. To avoid the threatened competition the date had been altered to Sunday last, but this did not prevent makers from holding aloof, and only twenty vehicles competed, including a dozen motocycles. The Gaillon hill lies on the main highway to Rouen, about fifty miles from Paris. The gradient is a straight one, having a length of a kilometre, and the incline for two-thirds of the way varies from 8 to 9½ per cent, and for about two hundred yards it easies off to the finish. If it had not been for the presence of the two Serpollet cars—the only big vehicles competing—the meeting would have fallen very flat indeed, but it was redeemed by the wonderful performances of the steam vehicles, which again showed that on short hills there is nothing to compete with them in gasolene cars. The light Darracq, driven by Baras, was supposed to have done something remarkable when it went up the kilometre gradient in 46 seconds, which is a long way inside the Gaillon record, but when Le Blon drove his Serpollet up in 40 3-5 seconds, or at the rate of about 55 miles an hour, the success of the gasolene vehicles appeared hopeless. M. Serpollet himself followed with the "Whale," and he seemed to be doing still better on the lower part of the hill, but he mistook the ridge for the finish, and slowed down before reaching the timekeepers, though his time of 41 2-5 seconds is still a remarkable one. Serpollet carried off three events, the big and light carriage records, as well as the gold medal offered by the Minister of Agriculture for the fastest car using alcohol.

On Sunday there is to be held the Chauteau-Thierry test, and in the following week another competition at Gaillon, for each of which about 150 entries have been received, and, after the failure of last Sunday's test, it is probable that in future the Vélo will leave the work of organization alone, and we shall thus again be having only one meeting at Gaillon and another at Chateau-Thierry, it is to be hoped at wider intervals than at present. Makers will evidently not care to take part in three meetings on three consecutive Sundays.

The muddle made with the timing arrangements at Deauville has called attention to the necessity of employing some mechanical means of time taking so as to secure absolute accuracy in the results and at the same time split up the seconds in tenths. In long distance racing the difference of a fifth of a second is, of course, of little importance, and the human timekeeper cannot very well be improved upon for clocking vehicles under these conditions, but now that the difficulty of getting permission for long distance races has compelled makers to confine themselves largely to kilometre record attempts, it is by no means easy to insure that the results are absolutely correct. The experience at Deauville has in fact shown that the ordinary methods of timing fast vehicles over short courses cannot be relied upon, and, whether it is done properly or not, there will always be some doubt as to their accuracy. If the records are to be beyond suspicion they must be clocked electrically or mechanically. Moreover, automobiles nowadays are capable of running at such terrific speeds in tests that the fifth of a second, so far from being a negligible quantity, actually makes an appreciable difference, which is something like eight yards when going at 75 miles an hour. Eight or nine metres in a thousand metres is something to be taken into account, and it is therefore proposed to use watches recording the tenth of a second. No man, however, would be able to stop his watch on the tenth with the absolute certainty of the time being correct, and for kilometre tests he must therefore be replaced with mechanical means of stopping the watches.

The first test with electrically clocking cars was made at Nice two or three years ago, when an installation was laid down by M. Louis Mors, but the system has failed to come into vogue, whether on the score of cost or inefficiency we are unable to say, and a very satisfactory, though complicated, form of electrical timing was adopted at Vienna during the kilometre tests in July last. Here again the expense was too great to warrant the system being used generally. M. Serpollet has this week been experimenting with another device, purely mechanical, which has the merit of great simplicity, and if it gives the results expected of it there ought to be no difficulty in employing it for all the short speed tests. The watch recording tenths of seconds is placed in a rubber case, which is fixed rigidly, and above the button is a lever kept back by a spring. To the end of the lever is attached a string, which is stretched tight across the road at the required height. As the car passes the string is depressed and pulls down the lever on the button of the watch. Evidently nothing could be simpler than such an arrangement. But the question arises whether the car would not give two distinct movements to the lever and thus start the split seconds again as soon as they are stopped. Possibly this would not be the case on a fast vehicle, because as soon as the string is depressed by the front wheels the back wheels would be on it in less than the twentieth part of a second, during which time the string would

Reindeer Coat From France.

Mindful that autumn winds are piercing the fair automobilist shows renewed interest in fur garments. The one shown is made of reindeer skin, and if looks count

for anything it is almost blizzard proof. Enveloped in its ample folds the elements possess little terror for its wearer, and riding can be indulged in with comfort much beyond the usual period.

Digitized by Google

not have had time to rise sufficiently to allow the lever flying back. This, however, is a matter that can only be proved by experiment, and any such difficulty may possibly be avoided by altering the tension of the spring. In any event, it is clear that with the cutting of records so fine, and the speeds at which cars now run, mechanical or electrical timing with watches recording tenths of seconds has become a necessity, and now that the need for some such system has become imperative there is no doubt that a means will soon be found of supplying the requirement.

The way in which new "inventions" are cropping up is really astonishing. It was recently stated in this journal that "a German engineer has found a new transmission which should make gear changing unnecessary," and then a description is given of the alleged invention, consisting of two disks operating at right angles to each other, so that any speed is obtained by moving one of the friction disks between the centre and periphery of the other. This is a very old friend, indeed. It is almost as old as the automobile, and was one of the first devices thought of by motor car engineers for simplifying the driving gear. We remember seeing it many years ago when it was first brought out by M. Lepape, who thought that he had suppressed all change speed gearing, but he soon found that the system gave him endless trouble, besides being a great source of loss in transmission. The loss of power with these friction cones is far in excess of that of any well lubricated gearing. The system is impracticable, and, though now and then we find new firms trying to modify this method of friction transmission in light cars, such systems are always abandoned. The German engineer would do better to try his hand at something else.

The taxing of automobiles has one good result—it gives us an opportunity of learning how many vehicles are in actual use, or, rather, the number that were in use a year ago. The official returns, just published, show that 5,386 automobiles were declared for taxation in 1901, and of these 1,149 were in Paris, this figure being made up of 398 two seated cars and 751 vehicles with more than two seats. Of those in the country there were 2,095 with two seats and 2,142 with seats for more than two persons. The aggregate nominal horsepower declared for all these cars was 26,427, and the amount raised by the taxes was $84,209. It is certain that during the present year these figures have been considerably increased, but we shall not know exactly to what extent until the end of 1903.

Will Make Runabouts.

Matters have progressed so far with Hibbard & Bush, who have been endeavoring to establish an automobile factory at Fond du Lac, Wis., that their plans are ready to be made public. They will manufacture a 5½ horsepower runabout, with reachless running gear, to sell for $650.

SMOKY CITY ORDINANCE

Fixes Speed Limits at 6 and 10 Miles—Will be Opposed by Local Autoists.

It is little wonder that the ordinance regulating the use of automobiles introduced in the Pittsburg (Pa.) council has aroused hostility. Six miles in the business portions of the city and ten in the outlying sections are the maximum speeds permitted. For the violation of the provisions of the ordinance fines up to $100 may be levied. It need scarcely be said that a determined fight will be made against its passage. The ordinance in full follows:

An ordinance, regulating the rate of speed at which automobiles, locomobiles and all self-propelling machines shall be operated or propelled upon the thoroughfares within the limits of the city of Pittsburg.

Section 1. Be it ordained and enacted by the city of Pittsburg, in Select and Common Councils assembled, and it is hereby ordained and enacted by the authority of the same, That from and after the passage of this ordinance no automobile, locomobile or other self-propelling machine of whatever kind or character shall be driven, propelled, operated or run at a greater speed than six (6) miles an hour along and within the streets, avenues and alleys in the territory bounded by Water, Grant, Eleventh streets and Duquesne Way; or when making crossings anywhere within the limits of the city of Pittsburg on any intersecting streets, avenues or alleys where there are car tracks on either or both of such intersecting streets, avenues or alleys; and at no greater speed than ten (10) miles an hour along or on any and all streets or alleys, avenues or boulevards, public highways or thoroughfares within the limits of the city of Pittsburg.

Sec. 2. That any person, or persons, violating any of the provisions of this ordinance shall be subject to summary arrest, and upon conviction shall be subject to a fine or penalty of not less than twenty-five ($25) dollars, nor more than one hundred ($100) for each and every offence; said fine to be collected in the manner provided for the collection of fines and forfeitures in an ordinance entitled "An ordinance relative to the collection of fines and forfeitures," approved December 7, 1876.

Sec. 3. That any ordinance or part of ordinance, conflicting with the provisions of this ordinance, be and the same is hereby repealed, so far as the same affects this ordinance.

Eight and Ten Mile Speeds.

An ordinance introduced in the lower house of the Kansas City, Mo., city councils last June, and held over without action, is to be taken up again. Its principal provisions are as follows:

"No person shall ride or drive, or cause to be ridden or driven, any bicycle, tricycle, tandem bicycle, automobile, locomobile, horseless carriage, or any other vehicle propelled by foot power, steam, gas, gasolene or electricity, on or along any street, alley, avenue, boulevard, highway, park or other public place within the following district in this city at a greater rate of speed than eight miles an hour, to wit, a distance bounded on the north by Fifth street, on the west by Hickory street, on the south by Nineteenth street, and on the east by Cleveland avenue; nor on and along any other street, alley, avenue, boulevard or highway, park or other public place within the limits of Kansas City outside of said district at a greater rate of speed than ten miles per hour."

The second clause required that all horseless carriages should carry a light in front at night. The third clause made the violation of the ordinance a misdemeanor, punishable upon conviction by a fine of from $1 to $500.

Alcohol and Other Tests.

For the month of October the most prominent French fixture scheduled is the "Circuit de l'Herault a l'Alcool," which will be held on the 12th. It is to be a sort of reliability trial, with the object of popularizing the employment of alcohol for propelling motor cars, and in addition to this will be a test of consumption of fuel, of the general efficiency of the machines, of their hill climbing and brake powers, of their comfort and elegance, and lastly of their speed over a measured kilometre.

The judging will be done in an ingenious manner. The car which is classed first in one particular virtue will have given to it as many marks as there are cars in the category to which it belongs, the car that is next best will receive one mark less, and so on. The same will be done for every particular virtue, and then the marks in each case will be multiplied by the following coefficients: Consumption of fuel, coefficient, 10; regularity of running, coefficient, 8; hill climbing capabilities, coefficient, 5; comfort and elegance, coefficient, 5; speed (over the kilometre), coefficient, 2.

The car that obtains the greatest total of marks will be, of course, the winner. There are many prizes to be competed for in the way of medals and bronzes.

Schooling Horses in Kansas City.

Members of the Kansas City, Mo., Automobile Club are actively interesting themselves in the matter of accustoming scary horses to the presence of the motor vehicle.

The club has adopted a resolution by the provisions of which a member will be delegated to take his automobile out on the boulevards each Wednesday for an hour or two and operate it to accommodate horse owners.

Patterson & Shaw, 58 Schermerhorn street, Brooklyn, have been succeeded by Alfred B. Harrington.

YALE MAKES ITS BOW

New Touring Car With Many Good Features Comes From Toledo.

"Good old Yale" has a worthy bearer of its name in the new "Yale" tourneau touring car just brought out by the Kirk Manufacturing Co. of Toledo, Ohio, makers of the famous Yale bicycles.

While it has been known for some time that the well-equipped Kirk Manufacturing Co. were at work on a gasolene vehicle, the appearance of the car at a well-known Chicago agency created something of a sensation in Windy City automobile circles. And well it might, for seldom, if ever, has the initial effort of any concern been so good.

Finished in Yale blue and black, with yellow running gear, symmetrical and graceful in design and general appearance, the Yale car at once attracts the eye, and holds it.

That it is as good as it looks was so quickly demonstrated that the first car that reached Chicago was gobbled up on the very day it made its appearance there.

The engine is of the double cylinder horizontal opposed type, 4½x4½ stroke and bore, and develops, so its makers prefer to state, power enough to drive the machine anywhere. Nominally they mention "8-horse power and some more," and, as Ezra E. Kirk picturesquely adds, "that 8-horse power isn't canary bird or mice power, either."

A strong feature of the machine is the accessibility to the engine, a small paneled door on either side affording ingress to all parts, while the body being divided, the removal of four bolts permits it to be taken off altogether.

The operating is simplicity itself, two speeds forward and a reverse are provided for, and in the high speed the car is practically noiseless.

In a trip through the factory to-day a Motor World man was privileged to see the cars in all stages of construction. The works of the Kirk Manufacturing Co. are very complete, including a large drop forge shop, and consequently they are manufacturing almost everything themselves.

The automobile department is under the superintendency of Mr. George Trout, who is the inventor and designer of the car, and who, it will be remembered, last year brought out a runabout at Detroit that attracted much attention.

The system that has made the Kirk Manufacturing Co. successful in their various lines of manufacture already extends to the latest addition, and everywhere there is an orderly arrangement apparent, work progressing from one operation to another and in the assembling room in character and extent suggesting uniformity and interchangeability throughout.

From the assembling room, which is in the second story, to the yard there is a 20 degree runway, on which every car is sent down and up, being stopped and started at any point at will. The Kirk company lay much stress on the hill-climbing and efficient braking features of the Yale car, facts which speak for themselves.

While there will be no attempt to produce large quantities of machines this year, a fair number are coming through, enough to entitle the makers to be classed among the "actual manufacturers."

A cut of the car will appear in an early issue of the Motor World.

Slippery Street Causes Trouble.

So systematically has the flooding of Fifth avenue, this city, by watering carts been going on for some time that the Automobile Club of America, through its board of governors, has been impelled to protest against it.

The slippery condition of the asphalt makes travel dangerous for horses. Especially is this so on grades, where it is impossible to stop quickly, or near intersecting railway tracks.

There has been a general belief that the blame lay with the Street Sprinkling Association, which has the contract for spraying the streets of the city; but it is shown that the blame should be shared by the Street Cleaning Department.

Commissioner Woodbury has devised a new plan for cleaning the city's famous thoroughfare. He gives it a wet instead of a dry cleaning; under his direction, patent trucks, sending out swift streams of water, course the avenue twice a day. These streams are intended to be swift enough to take off the dirt and remove the gummy, slippery coating which results from a slight wetting, such as a sprinkler gives.

"I am trying to put into effect here the Paris method of cleaning the streets," said Commissioner Woodbury recently. "I am now having a truck made, which will give fifty atmosphere pressure; and I purpose to follow this and others with rubber sweepers. This method will give a perfectly clean surface. The trouble now comes from the street sprinklers. On October 15 the sprinklers will make their last voyage through the avenue, and after that automobilists will have no cause for complaint."

Will Use the Cinematograph.

At the approaching Paris Automobile Salon a novel idea is said to be contemplated. It is to make use of the cinematograph for the purpose of giving representations of certain automobiles. A number of manufacturers will form a combination to go into the scheme, and in this way the expense, which would be too great to be borne by one, will be divided.

Each car will be shown stationary, running, and in parts, and the particularly interesting points of all will be explained by an attendant, who will also distribute literature to those who express a desire to know more about a certain construction.

UNGER WILL FIGHT

Newark Man Carries Speed Arrest Case to New Jersey Supreme Court.

Reference was made some weeks ago to the determined stand made by Herman Unger, of Newark, N. J., who was arrested at Scotch Plains for exceeding the legal rate of speed in Fanwood township. It was shown that by the admission of the local officials the speed complained of was a reasonable one.

It now appears that the accused is determined to fight the case to a finish. In consequence, the Supreme Court of New Jersey will be called upon to decide whether a municipality has a right to make laws singling out automobiles from other kinds of vehicles and fix a special limit for their speed.

Mr. Unger was to appear before Justice Clark, of Scotch Plains, to answer to the charge, but his attorneys, Reed & Coddington, obtained a writ of certiorari from the Supreme Court, which will temporarily halt the proceedings.

This writ, which was served on Township Clerk Edward Hand and a certified copy of which was served on Justice Clark, both of Fanwood township, requires the township authorities to send up to the Supreme Court the ordinance and all the proceedings relative to the passage of the ordinance pertaining to the speed of autos. These will be reviewed by the Supreme Court, and a hearing called, when both sides will have an opportunity to argue their points. Meanwhile, the proceedings in Justice Clark's court are at a standstill and will remain so until a decision is given as to the constitutionality of the ordinance.

Former Judge W. A. Coddington, of the law firm of Reed & Coddington, who represent Mr. Unger in this case, was asked the reasons for the action.

"We claim," said Mr. Coddington, "that the ordinance is defective and void in law because it discriminates between the speed of automobiles and other vehicles. We also claim that the ordinance is a restriction of private rights of persons travelling on the public highway, and that the ordinance is unauthorized by the township act."

This case promises to attract much attention, not only in Scotch Plains but throughout the State, as it is the first time that a legal fight has been made on the constitutionality of the local ordinances which affect automobiles and no other vehicles. There is no precedent in the case, except the ruling as to bicycles, and the decision of the Supreme Court in the case will naturally affect the local ordinances on the subject throughout the State.

An electric patrol wagon, ordered by the Atlantic City, N. J., police department, is almost ready for shipment by the Electric Vehicle Company.

Cable Address Motorworld.

Entered as second-class matter at the New York, N. Y. Post Office, November, 1900.

NEW YORK, OCTOBER 9, 1902.

An Auspicious Beginning.

With an entry list as large as can be handled without inconvenience, the promise of good weather and the certainty of a preponderance of good roads, the second important function of the Automobile Club of America starts to-day under exceptionally good auspices.

The number of starters is expected to fall but little below that of entrants; and for good reason. The cars are, almost without exception, far removed from the experimental stage, and they will be brought to the starting point with the full expection to of taking them through the entire contest. Some of them may fall by the wayside; a few of them will undoubtedly do so. But the vast majority of them are practically certain to make the journey without mishap, or only with such troubles as may be put to rights along the road or at the control stations.

As we have had occasion to say on previous occasions, the rules have been wisely framed. They have been so drafted that they escape the Scylla of too great severity on the one hand, and the Charybdis of undue leniency on the other.

The performances of the cars will be made plain as they have rarely been before. Where good work is done it will be plainly shown; just as the accidents and incidents that are certain to befall some of the vehicles will be recorded with equal fidelity. Concealment of weak points will not be possible. From the start to the finish each vehicle will be closely watched, and every lapse from the straight and narrow path of rectitude will be noted down.

The small showing of foreign cars in the contest is somewhat disappointing.

In the last year's run one vehicle of this kind was easily first in point of speed, and scarcely less meritorious for all-around excellence; while others of its class also made good showings. This was when the number of foreign cars here was much smaller than it is to-day, and when we were not so keen for comparisons as we are at the present time.

However, the work of the vehicles of home manufacture will possess sufficient interest, while the few imported cars participating will at least make some comparison possible.

The Automobile Club of America has planned almost perfectly. The experience it has obtained in managing affairs of this kind should cause the performance to be on a plane with the planning.

The only place where there seems to be any possibility of a botch being made is with the observers.

Their duties are delicate, arduous and exacting. They have been carefully selected, however, and their personality, combined with the fact that for a full week they are the guests of the club, should be a guarantee that their work will be, as it should be, well done.

Outside of their work the most interesting part of the contest will be the effect that the restrictions on replacements will have on the progress of the cars. By the rules, certain parts can be replaced, while others cannot. The justifiability of these inclusions and exclusions is, therefore, on trial. The outcome will give us a line on the matter that will prove of use in future contests.

Way for the Reliability Contest!

THE WEEK'S CASUALTIES.

TOTAL: KILLED, 33; INJURED, 57.

RAILROADS:	Killed, 23 / Injured, 23.
TROLLEYS:	Killed, 7. / Injured, 18
HORSES:	Killed, 3. / Injured, 12.
BICYCLES:	Killed, 0. / Injured, 1.
AUTOMOBILES:	Killed, 0. / Injured, 3.

TOTAL, TWO WEEKS: KILLED, 80; INJURED, 193.

Where the Trouble Lies.

No one who has given the subject of automobile track racing any thought can escape the conviction that the year past has wrought but little improvement in the sport as a sport.

Taken as a whole the race meets of the present season have shown some improvement over those of last year. But the strides made have not been great—certainly not as great as the progress of the industry in that time would cause one to expect with entire reason. There are many more and infinitely better automobiles produced in this country now than there were a year ago, and because of this fact there should be much more and considerably better racing.

Automobile racing appeals, or can be made to appeal, to the public in a twofold aspect.

First, there is the spectacular side of the matter. The famous racing cars and their equally celebrated drivers are much in the public mind, and it is an easy matter to work up a desire to see them under circumstances which will permit the development of this speed and skill in a manner impossible on the public highways. The very appearance of the space devouring monsters, the varied noises that accompany their flight around the track, and the truly heroic battles that are necessary to get them safely around the turns—these rarely fail to cause them to equal the anticipations formed of them.

Second, there is the element of racing, of real speed contests between vehicles so closely matched that the result is not apparent until the wire is reached.

The latter is really the quality on which the permanence of automobile track racing, if it is to be permanent, must be built.

Contests against time, or mere speed ex-

Digitized by Google

hibitions, possess only an ephemeral interest. They serve as curtain raisers and are excellent talking features. But even the most hardened race goer would soon tire of them as a steady diet, and demand pabulum of a more satisfying if less meretricious character.

During the present season the spectacular side of the game cannot be said to have suffered. If the dashing personality and the well founded fame of a Fournier was wanting, and with it the glamour that always attends anything that partakes of an international character, the domestic cars and drivers quite made up for it.

The names of Winton and Cannon stand at the head, of course. Each has more than fulfilled the expectations formed of him, and given race meet attendants manifest pleasure. With them have been Harkness, Howard, White and others, whose performances have been creditable in the extreme.

But if all that could be asked for in this direction has been given, it is vastly different when we turn to competitions.

Races between evenly matched cars have been few and far between. Runaways have been the rule and not the exception. The lack, as well as the need, of them has been demonstrated by the eager attention and tumultuous applause given the few contests of the kind that have taken place. They were grateful oases in vast and unbroken deserts.

The reason for this distressing lack of close races is not far to seek.

It is not the want of handicapping or division into classes, or the failure to go into such matters as horsepower, cylinder bore and stroke, that is to blame. The absence or presence of such expedients for equalizing matters would really count for little.

The trouble is the lack of entries. Race meet promotors are keenly aware of the great difficulty of obtaining even a respectable showing of contestants. In spite of all their efforts the sum total of cars usually hovers around the dozen or dozen and a half point, this including all the vehicles the owners of which could by hook or crook be induced to enter into the competition.

When the time came for the races there was found to be a disheartening number of withdrawals.

For one reason or another cars failed to show up at the track, or were scratched from some or all of the races in which they were entered. The fields dwindled so much that frequently the number of prizes given could be cut under the conditions of the race, or the latter even declared off.

The remedy is bigger fields and a more minute division into classes.

There are hundreds of evenly matched vehicles; cars that without possessing very great speed can yet furnish interesting contests—and, after all, that is what is wanted. Encourage the owners of such cars to enter, guarding them from the ridicule consequent upon being badly beaten by so framing the rules that only similar vehicles will compete against them.

Such a method, if tried next year, will almost certainly work a decided improvement in the sport of racing.

A Much Needed Improvement.

Next to the smell of partially consumed gasolene, which is common to many cars—and in the public mind associated with nearly all automobiles—the feature of the average gasolene car mostly strongly complained of is the noise.

With the average user of the motor vehicle this is a matter of little moment. Whatever dislike he may have had for it in the beginning soon disappears. In the case of the French user, for example, a positive liking for the noise of the exhaust arises, and a sort of competition sets in to see whose car shall give the best results in this respect. The efficiency of mufflers becomes a matter of no importance whatever, and if left to themselves no small number of such automobilists would discard them altogether.

But the attitude of these and other users is a matter that need not give us any concern just now. It is the public that objects most strongly to the noise, and to its wishes we must give some slight consideration.

At a recent race meet a car signalized itself on its debut quite as much by its remarkably silent running as by its success as a speed vehicle. The "noiseless car," it was dubbed by many, and this in spite of the fact that it was noiseless only by comparison with the other cars pitted against it. More questions were asked about this single feature than all others combined.

There is another well known make of car that has long excited favorable comment by the unusual success which attends the efforts of its muffler to really muffle.

As this car goes by people stop in the streets and look at it, impressed with the fact that there is something unusual about it. Approving remarks are made, and even among tradesmen and automobilists using other makes this feature is dwelt upon with approval, and wishes are expressed that other cars were as well fixed in regard to mufflers as it is.

"What, buy one of those dirty, bad smelling, noisy machines? Not if I never got a chance to enjoy the pleasures of automobiling," was the way one man put it to us, and he wound up by saying that of the three disadvantages referred to he thought the noise, the constant thump, thump, of the exhaust was the worst feature.

It is an open secret that comparatively little attention has been given to the subject of muffling, not because there were any great difficulties in the way, but rather because it was felt that it made but little difference how much noise, within certain limits, there was. Of course, the fear of impairing the power by efficient muffling has something to do with this indifference. But the major part is due to the inferred lack of a demand among buyers for noiseless machines, and there can be no question that if such a demand were believed to exist speedy steps would be taken to remedy the trouble.

But even outside of such a demand, the fact remains that in the public mind, already irritated sufficiently, goodness knows, against automobiles and automobilists, the noise of the cars constitutes no small part of their offending.

A reform in this respect would do a world of good.

How They Work It.

Down on Long Island the new game, chasing the automobilists, is adding fresh zest to the erstwhile tranquil lives of the bucolic inhabitants. The sleuths whose business it is to signal the approach of victims to time them and then to arrest them, and who are out all day long, rain or shine, never get tired of the game. They have small boys who warn them of the coming of the proscribed vehicles, thus permitting them to get ready in ample time. It is so still in those sequestered regions that the sound of the exhaust of a gasolene car can be heard a long distance off. If the sleuths referred to happen to be dosing when this takes place the small boys come running to them with the glad news that another automobile is approaching, and the tin can signalling apparatus is tested to see if it is in working order, the "stop watches" are wound up and started and then everybody gets out of sight. And it is seldom that the watches fail to declare a driver guilty.

Design of Early American Gasolene Vehicles

While Europe is the home of good roads and has been largely recognized as the originator of the motor vehicle, the fact remains that American mechanics have always been awake to the possibilities of the self-propelled vehicle, and have not been behind in the production of devices of this kind.

For many years experimental vehicles have been produced on both sides of the water and while lines of experiment and production may extend back farther in Europe than in America because of the encouragement constantly held forth by the ever present good roads there are a number of manufacturers who have done more or less work on this problem in the past fifteen years, and a record of this work cannot fail to be of interest.

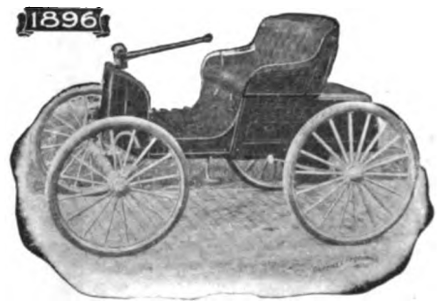
Perhaps the most persistent if not the original gasoline motor vehicle builder is Charles E. Duryea, who, assisted by his brother, J. Frank, brought out the vehicles shown herewith. He selected the internal

combustion motor, electrically fired in 1886 as the proper motor for vehicle work, but no suitable motors were in existence at that time or for years after, so experiments were made as time and money permitted, to produce a vehicle motor. In 1888 he assisted in an advisory capacity on a steam-driven buggy, which, however, was not finished because of the death of the maker.

By 1891, however, the market was regarded as sufficiently ripe for a cheap carriage, costing $350 to $500 and intended for people not able to afford the expense of keeping a horse and buggy. To meet this low price market a carriage of the design shown was begun following as closely as possible horse carriage lines and using standard parts wherever practicable. This vehicle was finished in 1892 with a motor giving 1½-horse power water cooled, electrically fired and with spray carburettor, which devices have since become standard. J. Frank Duryea, a young and most able mechanic, was in charge of the work, and to his skill and indefatigable perseverence much of the perfection of details with consequent successful results are due. The lack of power necessitated a larger motor with somewhat heavier construction, which was embodied in the phaeton shown, finished in 1893, fully a year ahead of any other American product, unless the single experimental vehicle of Nadig Bros., Allentown, Pa., is an exception. The fact, however, that the

vehicle shown here was the second of its kind indicates that the first was the earliest American gasoline vehicle.

The tiller steering, now so common, was used, with fixed rear axle and double chain drive to the rear wheels. A variable friction driving device was likewise used, but as more power was found to be necessary this device, good enough for small powers, was abandoned and a positive gear with friction clutches substituted. The motor was controlled by governor and the speed variation by an up and down motion of the tiller lever, which permitted either rider to handle the vehicle as readily as a horse could be handled, giving a simple controlling arrangement which most modern manufacturers have not yet succeeded in approaching. Being built at Springfield, Mass., where winters are long and snowy, spiked iron



tires were necessary to secure traction, and the vehicle was undoubtedly fully as capable as the foreign product at that time, although not well suited to the bad roads of America.

The experience gained, however, opened a new line of thought, for it showed the superiority of the motor over the horse, and instead of attempting to build a low-priced carriage it was decided to build the best motor carriage possible and sell it to people who desired and could afford something better than a horse, at prices ranging from $1,000 to $2,000.

Accordingly the 1894 model was designed and built in that year, most of the detail work being left to J. Frank Duryea, while Charles maintained his connection with the bicycle business and assisted to provide the sinews of war. This vehicle was finished in the winter of '94 and '95, and used almost daily the following summer. It was regarded as sufficiently perfect to be exhibited without excuses and made trips, such as to Hartford and back, at the rate of 12 to 15 miles per hour, over roads not so good as they are to-day, when traversed by the New York to Boston contest at no greater rate of speed.

About this time the Paris-Bordeaux race attracted such attention throughout the world that the Times-Herald of Chicago offered $5,000 in prizes for a contest to be held at Chicago in the fall of that year, believing that sixty to ninety days was ample

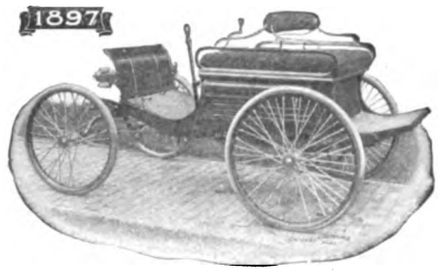
time to complete a perfected motor vehicle which consisted only of a motor attached to a vehicle and could readily be made by any one. More than eighty entries were received, but only a few carriages were ready, so the contest was postponed until Thanksgiving Day, at which time eleven vehicles received starting numbers and seven actually started.

A deep snow had fallen two days before and lay everywhere 12 to 15 inches deep, covered with a crust strong enough in many places to support sleighs and pedestrians. This unexpected obstacle proved insurmountable to most vehicles, and all the starters excepting Duryea required pushing (contrary to the rules) within 100 yards of the start and frequently thereafter. The carriage shown won the first prize, $2,000, being the only carriage to return to its stable the same day, while but one other, a Benz (of which two started, being at that time one of the best foreign machines), succeeded in covering the course.

This contest was the first automobile event in America, and marked the beginning of the new business. The enthusiasm and ex-

Digitized by Google

perience of the various inventors was not without result, and the conditions by their very secerity did much to place the American motor vehicle ahead of the world in capability. The Haynes-Apperson Co. of Kokomo, Ind., entered their second vehicle, which they had just finished, their first one having been finished in July, 1894, but buckled a wire wheel in a car track while proceeding to the starting point and were therefore unable to compete, an accident much to be regretted, for it shut out of the contest a most deserving machine, being, like the Duryea, double cylinder and representing a better design than the foreign machines entered.



The winning vehicle had hollow parcels' dash, water tank under the forward floor exposed to the air, pump circulation, gear and friction clutch transmission, giving three speeds forward and reverse, together with motor shaft lengthwise the vehicle, with bevel gear transmission of the power to the counter shaft, all of which features have since been largely adopted by others, particularly by the foreigners, who at this time were largely using belts. Although equipped with governor, it had a push button for varying the governor action, as is still largely used. These many modern features, coupled with the evident superiority of the vehicle as compared with foreign machines brought to this country, show clearly the superiority of the American product.

The need for greater power and the possibilities of high speed were made evident by the Chicago winner, on which account the next design had lower center of gravity, long wheel base, smaller wheels, larger tires, more powerful motor, greater fuel capacity, and became in fact a modern vehicle. Four of these were entered in the Cosmopolitan race from City Hall, New York, to Irvington and return Decoration Day, 1896, while three of them were the only vehicles to return to the city the same day.

In this contest the only foreign vehicle entered was a Roger, a prominent French vehicle of Benz design. In the carriage shown belt transmission instead of gears had been adopted because of its greater simplicity and lessened cost, a distinctly backward step as experience showed, but made because of the prevailing use of belts abroad, which seemed to appeal to the public as the proper thing.

In 1896 a light, more powerful vehicle of much the same design was brought out, and took part in the Liberty Day run, the first automobile event in England, from London to Brighton, Nov. 14, 1896. In this event the first, second and third winners of the Paris-Marseilles-Paris race, with the men who drove them to victory, were present for the purpose of leading the way and showing the assembled multitudes the first motor vehicles in the world. The Duryea vehicles, of which two were entered, occupied an obscure position well to the rear, behind slow-going traps such as electric bath chairs, and were not able to get ahead until well out of the city, after which they rapidly passed to the front, the one shown beating the nearest foreign vehicle into Brighton by nearly an hour; distance 52 miles; a conclusive showing of the superiority of the American product. This unique record still stands as the only instance of an American gasoline vehicle beating the foreigners on their own roads.

In this vehicle was used for the first time a dynamo for ignition purposes, the advantages of which are now quite thoroughly

recognized by most prominent builders. This vehicle weighed less than 1,200 pounds, and was equipped with five to six horse power, being therefore much higher powered than many vehicles on the market to-day.

The light, wire-wheeled runabout was next given attention, and was almost wholly the work of J. Frank Duryea, both in general design and detail construction. It made use of opposite double cylinders, as advocated by the Haynes-Apperson Co., instead of the twin cylinders formerly used, adopted the steering post, with crank or wheel as desired, instead of the tiller, and incorporated the change speed lever with the throttle instead of with the steering as before. Corrugated tubular water tanks along the sides of the vehicle and detachable dos-a-dos seat

were modern features. Both this machine and its predecessor used angle iron framing and semi-elliptic springs, no reaches and similar modern features, while the inclined floor shown has but recently been adopted by others.

Profiting by these various experiences Chas. E. Duryea designed in 1897 a triple cylinder motor of light weight and great power, and a transmission gear of the sun and planet type, applied on the motor shaft by the side of the flywheel, making the motor and gearing a unit, which construction is now beginning to be recognized as the cheapest and most satisfactory yet designed. No counter-shaft, no complicated framing and no extra bearings were required by this construction, but the power was transmitted directly from the motor shaft to the rear axle by chain, also of special design. This vehicle was further built with either three or four wheels, and the three necessary functions of steering, throttling and speed changing were incorporated in a single lever placed between the riders, so the vehicle could be driven from either side or with either hand, thus finally carrying out the long cherished idea of the inventor that a motor vehicle must be handled as easy or easier than a horse by any member of the family.

The value of multiple cylinders is being recognized by the public more than ever before, and a number of makers such as Wolseley and Brooke of England and the International Co. of America have recently adopted triple cylinder as possessing advantages over double without the complication of quadruple.

The fact that so many important features first shown in America have since been adopted by foreign manufacturers certainly bears out the assertion that America has led in design and quality if not in the number of vehicles produced.

Clearly Illegal Position.

Chief of Police Maloney, of Niagara Falls, N. Y., is reported to have stated that it is his intention to "take steps at once to enforce the speed regulations placed upon automobiles of the city by the city ordinances, which state that horseless carriages shall not be driven at a rate of speed in excess of 12 miles an hour from sunrise to sunset, and at a rate of six miles an hour from sunset to sunrise."

The doughty chief is reminded that there is a law in this State which distinctly forbids the passage of any ordinance fixing the speed of motor vehicles at less than eight miles per hour. Consequently, if Niagara Falls has a law making the maximum speed at certain hours six miles it is clearly illegal.

Syracuse to Enforce.

Syracuse, N. Y., automobilists have been notified that hereafter the law limiting speed to eight miles an hour will be strictly enforced. This is the result of the action of the commissioner of public safety. He has reminded the head of the police department that eight miles an hour is the limit of speed permitted by a vehicle or machine of any kind in the city limits according to the law. He also says that a speed of five miles an hour only is permitted in turning corners. The order also instructs policemen to compel owners of vehicles, automobiles and bicycles to keep to the left side of the road.

Curious Demand From Cuba.

"About the most inexplicable demand that is reaching me," said Charles E. Miller, the well known New York jobber, "is the call from Cuba for automobile bells. Although there are not more than six or eight motor vehicles on the island, for the past several weeks I have been shipping an average of two dozen bells per week. What they are doing with them all beats me."

THE CASUALTIES OF THE WEEK

RAILROADS {Killed, 23. Injured, 23. **TROLLEYS** {Killed, 7. Injured, 18. **HORSES** {Killed, 3. Injured, 12. **BICYCLES** {Killed, 0. Injured, 1. **AUTOMOBILES** {Killed, 0. Injured, 3.

TOTAL, THIS WEEK: KILLED, 33; INJURED, 57. TOTAL, TWO WEEKS: KILLED, 80; INJURED, 193.

Possibly it was a bad week for automobile accidents—bad, that is, from the standpoint of the autophobe—for the records show an insignificant number of them. Only one of these was of a nature at all serious.

Other classes of accidents, however, do not make equally pleasant reading. In fact, they are mainly of a fatal nature, and make sickening reading. In conjunction with those of the previous week not previously noticed, the showing is an appalling one. The railroad train is, of course, by far the most deadly. Next to it is the trolley car, while the horse managed to inflict a great deal of damage.

The list below covers two weeks, that from October 1 to 7, inclusive and from September 25 to 30, inclusive, the latter containing only accidents not reported last week.

PRIOR TO OCTOBER 1.

Fonda, N. Y., William Maxwell struck by train; badly injured.

Cleveland, O., E. H. Hopkins and infant daughter and Miss Trowbridge had their teams struck by trolley car; all were severely bruised.

Union Hill, N. J., ten persons were hurt by a runaway trolley car.

Waltham, Mass., Mrs. Gale struck by bicycle rider and injured internally.

Rochester, N. Y., W. E. Wittman, baker, team struck by trolley car; badly bruised.

Ithaca, N. Y., F. S. Hopkins, motorman, struck by trolley car in collision; died.

Indianapolis, Ind., four persons injured by collision between train and trolley car.

Chicago, Ill., Anton Osowski killed by Panhandle train.

Chicago, Ill., C. M'Kune struck by trolley car; killed.

Geneva, N. Y., W. W. House kicked by a horse; will recover.

Watertown, N. Y., J. Woodruff struck by train; killed.

Utica, N. Y., Frank Goodrich struck by train and killed.

Utica, N. Y., George Girvin fell from trolley car; died from injuries.

Ogdensburg, N. Y., three-year-old child of G. W. Huntley struck by locomotive and killed.

Springfield, O., Miss Rose Lessler killed and D. Sullivan seriously injured by trolley car.

Frugality, Pa., Edward Dumphy, driver, thrown from team; several ribs broken.

Ashland, Ky., William Jackson, brakeman, killed by engine.

Highmore, S. D., Findlay Guiher thrown from horse; killed.

San Francisco, Cal., Mrs. Jas. McLean severely injured in runaway trolley car.

Oakland, Cal., Samuel Spring, E. A. Higgins and Willie Spring, struck by train; the last named may die.

Omaha, Neb., Mrs. Mearaschi struck by train; badly cut about face and hand.

Huntingdon, Ind., Fred. Fahrnow, while loading a freight car, fell and cut his foot with a cant hook, causing a fracture of the heel.

Huntingdon, Ind., Mrs. Alberts struck by train and severely bruised.

Colombus, O., Jennie and Robert Batterson, children, struck by trolley car. The boy's leg was broken and the girl was badly cut on the head and body.

Russet, Indian Territory, L. Cashion fell from a train and was killed.

Rennselaer, N. Y., Carl A. Mittwede struck by train and killed.

Wilmington, Del., Emmett Maloney, car inspector, struck by freight cars; afterward died.

Newburgh, N. Y., seven men injured in collision between trolley car and train; one may die.

Barrytown, N. Y., C. Wheeler and B. Grube struck by railroad train. Wheeler's arm and leg were broken.

Birmingham, Ala., W. H. Embrey struck by freight car; died.

New Orleans, La., Howard Stowe run over by train; killed.

Dallas, Tex., Michael Davis, brakeman, caught between two cars; killed.

Conneaut, O., Alfred Hall, brakeman, fell under freight train; killed.

Youngstown, O., Geo. Bagnull, brakeman, struck by car; killed.

Great Falls, Mon., Mary Konisky struck by train; killed.

Bluefield, W. Va., William Jackson, brakeman, struck by train; killed.

Detroit, Mich., Gus. Felska struck by bicycle; died.

Montgomery, Ala., D. G. Bloom struck by train and several toes and other bones in foot broken.

Detroit, Mich., Leon Plaschke struck by train; killed.

Indianapolis, Ind., five persons injured by collision between trolley car and train.

Hartington, Neb., Jacob Soehner struck by train; killed.

Milwaukee, Wis., Mr. and Mrs. A. Mehl struck by trolley car and badly cut and bruised.

Bloomington, Ill., G. Williams struck by train; may die.

Decauter, Ill., Elmer Clayton struck by train; severely injured.

Kalamazoo, Mich., Fred Fick struck by train and severely injured.

Buffalo, N. Y., Mrs. Minnie Spears fell from trolley car and was cut and bruised.

New York, Simon Prockiezto struck by trolley car; may die.

Ithaca, N. Y., two men injured by trolley car accident; one died.

Buffalo, N. Y., Mary Bank struck by a wagon; arm broken.

Rockford, Ill., Micheal Rochford struck by trolley car and bruised.

Little Rock, Ark., W. S. Johnson, conductor, run over by his train; killed.

Temple, Tex., J. Stephens, brakeman, run over by train; killed.

Dallas, Tex., W. S. Wilson struck by trolley car and severely bruised.

Logansport, Ind., J. Johnson, brakeman, struck by car and spine injured; may die.

St. Paul, Minn., Samuel Carman thrown from his bicycle and seriously cut about head.

Jamestown, N. Y., Glenn Carnahan struck by train; killed.

OCTOBER 1.

Buffalo, N. Y., Eugene Carnel thrown out fo wagon by runaway horse; bruised and hurt internally.

Bloomington, Ill., Lloyd Nelson struck by bicyclist and bruised.

Wilkesbarre, Pa., John Mullen struck by trolley car; killed.

Albany, N. Y., Philip McGuire struck by freight train; killed.

Willimantic, Conn., unknown man struck by train; killed.

Lawrence, Mass., Geo. Laviolette, conductor, fell under trolley car; killed.

Claremont, N. H., two men struck by train and killed.

Enfield, N. H., F. Easton thrown from carriage by runaway horse; badly cut and bruised.

Canterbury, N. H., J. K. Hancock and son thrown from carriage by frightened horse; badly bruised.

Milwaukee, Wis., Elmer Sepner and Mrs. Waldo struck by trolley car; latter killed and former may die.

Milwaukee, Wis., Charles Muss struck by train; right leg fractured and otherwise cut and bruised.

Terre Haute, Ind., A. B. Stoner fell from bicycle and run over by lumber wagon; knee fractured.

Cincinnati, O., Jos. Marx injured in trolley car collision; concussion of the brain.

Paterson, N. J., C. Porta struck by train and killed.

Jamaica, N. Y., Maggie Malloy, four years old, struck by runaway horse; slightly injured.

Paoli, Ind., W. W. Key struck by train; killed.

Philadelphia, Pa., Joseph Lynch fell from his wagon and was run over; died.

Marion, N. J., Miss Florence Leighton struck by trolley car; leg broken.

Buffalo, N. Y., R. G. Wooden struck by Lake Shore train; killed.

Winsted, Conn., Hiram Traver struck by train and killed.

Elwood, Ind., Mrs. Archibald Wood struck by trolley car and injured internally; may not recover.

Newburyport, Mass., Mrs. Murphy struck by trolley car; will probably die.

Long Island City, N. Y., Charles Gray and John Denn struck by trains; killed.

New York, cab struck by trolley car and three passengers slightly injured; driver's arm broken.

Akron, O., R. Bence struck by locomotive; died.

Because of Location.

Owing to its proximity to two great cities—New York and Philadelphia—Doylestown, Pa., has become impressed with the magnitude of the automobile speeding evil, so it is declared. Last week the Grand Jury was informed by the court that it must take into consideration that "we are located between two great cities, and must of necessity gather some of the flotsam that swarms between these scenes of activities. The great number of our cases are not due to our own people, but to those who come from without our community.

"The court called the Grand Jury's attention to a new form of nuisance that was menacing the public, referring to the engines of steam or other motive power called automobiles. It is a common thing to read of deaths caused by the engines being run by reckless men, who by reason of their great wealth think they owe nothing to the safety of the community. What farmer or farmer's wife feels safe to hitch up and drive upon the public highway by reason of these engines? The safety of the public on the highway is a subject for the consideration of the Grand Jury, and they were instructed that the drivers who run engines at reckless speed can be arrested and indicted, notwithstanding how much money they may be the possessors of.

"It is therefore very essential that the palpable violation of the law should have the attention of the constables and supervisors, and it was hoped that any violation would be brought before the court where prompt justice would be meted out"

Talking Without Its Book.

"Grotesquely incorrect statements have found their way into print asserting that in the early days of bicycles the records of serious accidents in the roadways were as disquieting as the pitiful array of fatalities due to automobiles. There is no truth in such misrepresentations. In proportion to the number in use, automobiles have done more injury in the thoroughfares in every country where they are known than the bicycles ever did," says the Tribune, which has long omitted no opportunity to strike at the motor vehicle.

"Ponderous machines weighing many hundreds of pounds are, of course, more dangerous to riders and those who are run down than light "safeties" can possibly be. It is no exaggeration to say that so many men, women and children have been killed or crippled by carelessly handled automobiles that people of feeling are distressed and indignant."

Value of Good Appearance.

"We cannot help thinking that some makers are not careful enough of appearances. Very frequently we pass an agency for a fairly well known car which has a good reputation, and should sell well. Two of these cars stand in the firm's window, and something is always being done to them. Either the tires are off or the bonnet is removed, or some alterations are being effected to the gear," says a contemporary.

"This must have a bad influence upon the public, who will naturally conclude that if the agents themselves have to be continually tinkering with the cars, there would be plenty of trouble in store for the purchaser. The best of cars need adjustments occasionally, but the wise agent will not effect these in full view of the public, but will only have in his window cars that stand completely equipped and ready to run.

"We have seen instances of carelessness even in the best firms. The makers of one of the finest cars in existence were about to give an intending customer a trial run when the engine refused to start. It was only a faulty valve, which, when detected, was put right in a minute. But meanwhile another car had been requisitioned for the trial spin, and the customer would doubtless have had his good opinion a little disturbed. The motor car trade is a little in want of good window dressing—or should it be called stage managing?"

Purposes of the Pedestrians' League.

The Pedestrians' Protection League, the English organization whose formation was referred to a few weeks ago, has got along sufficiently to declare its purpose. These are as follows:

(1) The establishment of a parent society in London and some fifteen branch societies in provincial centres; (2) to oppose any alteration in the existing law relating to motor cars which might be prejudicial to the interests of the general public; (3) the registration and numbering of cars and licensing of drivers, and the indorsement or forfeiture of license on conviction of breach of regulations; (4) to employ inspectors on the main roads to watch delinquents and report facts to the society.

The league will also give free advice to its members in cases of accident or negligence, and assist non-members of the poorer class in obtaining compensation if justified.

INTERESTING FOREIGN MOTOR DETAILS

In a table prepared by that eminent French authority, the Compte Chasseloup-Laubat, the constructional details of the principal types of French motors are given in detail. The motors described are six in number, viz., the Panhard-Levassor, the Mors, the Buchet, the De Dion-Bouton, the Delahaye and the De Dietrich, the latter two having horizontal motors. The more important data is contained in the table follows:

Constructors.	Types (in horse power).	Normal Speeds per Minute.	Details of Construction.	Number of Cylinders.	Diameter of the Cylinders in mm.	Strokes of the Pistons in mm.	Volume of the Cylinders in Litres.
Panhard and Levassor.	5	750	Vertical motors. Cooling by water, pump, radiator, and all the cylinders, and cylinder heads. Ignition by tube or electric with coils.	2	80	120	0.603
	7	750		2	90	130	0.827
	10	750		4	80	120	0.603
	12-15	750		4	90	130	0.827
	16	750		4	100	130	1.021
	20	750		4	110	140	1.330
	30	750		4	130	140	1.858
Mors.	8	1,150	Vertical motors. Cooling of the cylinders and cylinder heads by water, pump, radiator. Magneto ignition.	4	70	95	0.366
	12	1,000		4	78	112	0.535
	15	900		4	87	128	0.761
Buchet.	4½	1,500	Vertical motors. Cooling of the cylinders and cylinder heads by water, pump, radiator. Electric ignition by coils without trembler and cam with sudden breaking. Wings (or flanges) on cylinder heads, smooth cylinder.	1	85	90	0.511
	6½	1,500		1	100	100	0.785
	9	1,450		1	110	120	1.140
	8½	1,500		2	85	90	0.551
	12	1,500		2	100	100	0.785
	16	1,400		4	85	100	0.567
	24	1,400		4	100	110	0.864
	40	1,350		4	110	120	1.140
De Dion-Bouton.	1¼	1,550	Flange cooled cylinder and head. .	1	66	70	0.239
	2¾	1,550	Water cylinder heads, flanges on cylinders.	1	74	76	0.327
	4½	1,550	Water cooled cylinders and heads.	1	84	84	0.466
	6	1,550	All these motors are vertical, electric ignition by coils without trembler, and mechanical trembler.	1	90	110	0.670
	8	1,300		1	100	120	0.972
	10	1,300		1	110	130	1.235
	12	1,200		2	100	120	0.942
Delahaye.	8	900	Horizontal motors. Cooling by water, pump, and radiator. Electric ignition with coils without trembler, and cam with sudden breaking.	1	110	140	1.330
	12	1,000		2	100	140	1.099
De Dietrich.	8	750	Horizontal motors. Electric ignition or by tubes. Water vaporizing, then condensing in the radiator. .	2	98	160	1.207
	12	750		2	110	160	1.520

Commentary

We had our share of adversities in our advocacy of the automobile, but they are all as nothing compared with the awful calamity which has just fallen upon Parisian automobiling. Diebler, who as "Monsieur de Paris" has an extremely lucrative business in shortening men's lives and their statues at one and the same time by the aid of the guillotine has wound in automobiling relief from the extremely strenuous demands of his profession. No sooner, however, did tout Paris become aware of this than a shiver went the entire length and bredth of the boulevards. How to escape from recognizing the public executioner as a fellow automobilist is what is now keeping the Marquis de Dion and other aristocratic sponsors of the motor vehicle from enjoying their usual complacency. Lacking any definite information from Leibler I conclude that he is not nearly as much wrought up over the matter as the De Dionites.

* * *

Nine men out of ten if asked why a man will deliberately drive a vehicle at a speed which not only endangers his own life but that of every other user of the highway as well would say that it was because the guilty driver was bereft of brains. As usual the nine men would be mistaken, and the tenth one—in the present instance he is a French physician of repute—would probably be found to be correct when he said that the cause of all the trouble was "locomotor hysteria." According to the French doctor this disease manifects itself in an insane desire of the stricken one to get over the ground quickly. A locomotor hysterialte cannot abide anything slow. Should he be a horseman, for example, he lashes his horse into a continuel gallop. The locomotor hysteric runs to catch a car, a ferryboat, an elevator or anything else when there is not the slightest need for his doing so. Naturally such a sufferer is at his worst when he grasps the steering wheel of an automobile and proceeds to slay distance records and such miscellaneous live stock as debates upon the order of its going. When this stage of the disease is reached the hysteric becomes that modern terror, the scorcher. The French discoverer of the microbe of speed madness does not suggest any remedy, but sooner or later I'll expect to see some smart Aleck come forward with a serum, one little inoculation of which he will guarantee will make the most violent scorches as gentle and as quiet as a suckling dove. In the meantime—well, we'll get along as best we can.

* * *

Writing about this French physician recalls what I told you last week about the British one, and the awful diseases he predicted would come from automobiling. Well, no French or British doctor need think he's going to have so good an advertising medium as the automobile all to himself. Our American doctors are not so slow as all that, and so our own Dr. Shrady, who is always ready to rush into print for any or no reason, comes promptly to the front and says: "Catarrhal affections and earache are very frequent among enthusiastic devotees of automobiling, while the constant strain on the nerves and muscles of the eyes is likely to produce conjunctiritis." Furthermore, Dr. Shrady declares that the suction of the air makes respiration difficult and irritates the air passages. But, last and worst of all, the rider in an automobile is in grave danger from a hitherto unsuspected cause since, according to Dr. Shrady, "escaped electricity is likely to prove harmful by producing irritability of the nervous system and severe headaches." When you read such things as this is it any wonder that, even as far back as Shakespeare's time, men were advised "to throw physic to the dags"?

* * *

Nay, do not pity him who sees
In any auto so much that doth displease,
His greatest joy, beyond a doubt,
Is finding things to kick about.

* * *

In England it is customary for careful people to take out policies of insurance protecting themselves from the wild decisions of appellate courts. If the British company which sells these policies will only open a branch office in this country I can assure them of a large, if not a profitable, trade among American automobilists, who have at present no form of protection from either the lawmaker, the law enforcer or the law construer, one and all of whom are against the automobile first, last and all the time.

* * *

One of those young matrons whose good fortune it is to have inherited money and to have wedded more, purposes introducing the fashion of having her motor coachman appear in a powdered wig. Here's where the Society for the Prevention of Cruelty to Humans ought to step right in and call a halt. To the eyes of all, except a society grand dame, perhaps, the coachman who finds himself metamorphosed into a chauffeur is already quite enough of a horse marine without any attempt to make him both uncomfortable and ridiculous by insisting that he don a white horse hair wig.

* * *

You can't easily convince yourself when you stand admiring one of those great, big, shining, rapid moving touring cars that the automobile is still in its infancy. However well you may know that the finest vehicle of to-day will be looked upon by the next generation much as we look upon the locomotives which were thought to be so wonderful in the early part of the last century, you cannot readily make yourself believe it will be so. But the pace is far more rapid nowadays than it was half a century ago. A new idea is quickly taken hold of and speedily developed, and the time will be exceedingly short before the automobile has been rendered in every way more efficient than it is now. The lesson taught by the locomobile has not been forgotten. What it took fifty years or more to do for the locomotive will be done, and better done, for the automobile in a decade at most.

* * *

Of course, I may from my occupation be inclined to view the matter too critically, but after a rather extensive study of the catalogues issued by automobile manufacturers I am of the opinion that most of them are failures—meaning the catalogues, of course. To be really effective a catalogue should be amply illustrated, fully descriptive and logically arranged. A catalogue, to my mind, requires more careful editing than does a magazine. The man who compiles a catalogue must have a knowledge of the business for which that particular catalogue is issued, and, combined with this knowledge, the ability to edit and to arrange it systematically, or the result will be a failure. This, to my mind, is why most catalogues relating to automobiles are not full value for the large amount of money they had cost those who paid for their issuance.

* * *

If you have an excellent map of this great and glorious country, and with it you possess patience and the eye of a hawk, you may, after a long search, find in the State of Illinois, a tiny speck upon it about the size of this . labeled "Mattoon." Of course you never heard of this progressive metropolis before, but that only shows your ignorance, not its insignificance. That fame may no longer class Mattoon among the "also rans" in the race for legislative automobile idiocy, a measure has been introduced in the City Council taxing all automobiles owned in Mattoon, Illinois, $200 per annum! Thus does the metropolis of Mattoon place itself abreast of all the great cities, and the membership roll of the Independent Order of Legislative Asses receives a worthy addition in the brother from Mattoon.

* * *

Perhaps it is but natural that I should be somewhat of a doubting Thomas, but in view of all the dam foolishness about the automobile which appears in print, can you blame me if I am inclined to sniff at a wireful message from Rome which announces that Marconi has said "he has perfected an electric motor car which, with a battery weighing 250 pounds, has a speed of 38 miles per hour and a touring radius of 560 miles from one battery charge"? Perhaps Marc. has done all he claims and more, but in view of certain promises made nearer home and as yet unfulfilled, if I had money enough to buy an electric vehicle I'd never send the order therefor any further away from where I am now than Cleveland, Ohio, or Hartford, Conn., U. S. A., Mr. Marconi of Rome and his promises notwithstanding.

THE COMMENTATOR.

NEW PANHARD CLUTCH

Famous French Firm Make Some Changes in Their Standard Pattern.

Anything of a novel nature bearing the stamp of Panhard is certain to possess unusual interest. Although not prone to make changes, whether of major or minor importance, the famous Paris firm is not content to stand still.

The new Panhard clutch is shown in the accompanying illustrations. The general arrangement is shown by figs. 1, 2, and 3. The first figure is a longitudinal section, the second being a transverse section on the line a b. Fig. 3 shows an alternative method of construction.

The arrangement consists in causing the two conical surfaces A B (figs. 1 and 3) to make contact, so that the female cone, which is seen to be bolted to the flange on the clutchshaft H, is driven by the male cone B, which is rotated by the studs C C (figs. 1 and 3) set in the rim of the engine fly-wheel V, and projecting therefrom to form sliding guide rods for the backward and forward movement of the sliding clutch B B, when same is actuated by the lever P P, operating through the sliding collar K K. The male and female coned clutches are retained in driving contact by the pressure of the spring D D, which has as a thrust block the collar N N fast on the hollow clutchshaft H. By this arrangement it will be seen that the thrust from the clutch spring, as generally understood, is altogether avoided, and the necessity for a thrust bearing done away with. The dished fly-wheel V is bolted to the flange on the endend of the engine-shaft M, the central hollow in the boss of the fly-wheel being fitted as an end bearing for the clutch-shaft H. The thrust of the spring at the moment of unclutching is taken by the thrust bearing X, but there is no permanent thrust of the spring when the friction cone clutches A B are in contact.

When the cone B is withdrawn from driving contact with the cone A it revolves freely on the clutchshaft H, and in the collar bearing K, but exerts no rotative force whatever on the shaft H although it continues to revolve with the fly-wheel V. When the cone B is withdrawn from contact with the cone A the shaft H is absolutely free from engine drive.

It will be noticed that both the male and female cones of the clutch are mounted upon the hollow clutchshaft H, and that the fly-wheel V forms no portion whatever of the clutch, its function being to drive the male cone B through the studs C C. The consequence is that under no circumstances can there be any end thrust upon the crankshaft, and, as before stated, it is only when the male cone B is out of engagement that there is any end thrust upon the clutchshaft.

A, female cone of clutch bolted to clutch shaft H.

B, male cone of clutch bolted to flange of sleeve G, free on shaft H.

C C, clutch driving studs, projecting from rim of flywheel V and driving male cone B.

D D, clutch spring.

E E, bushed cone sockets, sliding on studs C C.

F F, leather liner on male cone B.

G G, free sleeve on shaft H carrying male cone B.

H, clutch shaft.

K K, clutch collar, made in halves.

L, ring retaining K.

M, engine shaft.

N, clutch spring thrust collar fast on shaft H.

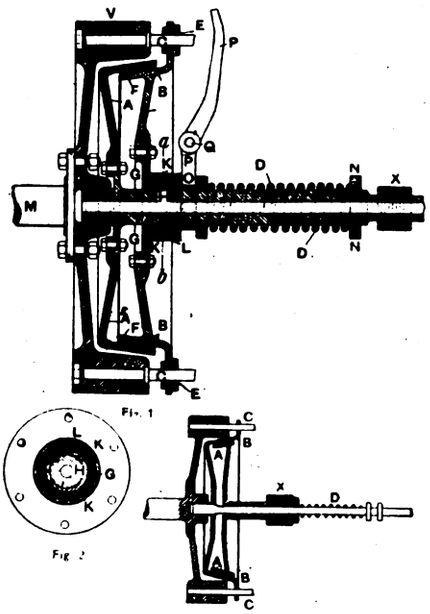

Fig. 1

Fig. 2

O, groove in K to take clutch fork.

P P, clutch fork.

Q, clutch fork spindle.

V, flywheel.

X, thrust bearing.

Metzger's Friends Surprise Him.

In testimony of the appreciation in which he is held William E. Metzger, promoter of the now twice postponed Detroit races, was made the recipient of a present that ought to compensate in no small measure for the disappointment and loss he has suffered on account of the bad weather.

The gift took the form of a magnificent punchbowl, the donors including almost every one of the prominent automobilists who had come on to attend the races.

The idea was not conceived until the same afternoon, but the punchbowl was selected, suitably engraved and presented at a little after-theatre supper, the presentation being made by Erza E. Kirk.

It was a very pretty and graceful tribute to a deservedly popular gentleman, and does equal honor to the givers.

DEVERY AND HIS TRACK

Ex-Police Chief Tells how he Will Cater to Automobilists.

Having had the "honor" of an introduction to the Hon. William S. Devery thrust upon him last week, and the thruster having informed the doughty politician that the Motor World man was "one of them fellers what writes about automobiles," the reporter felt called on to enact the part, and so told the famous legislator that he was the subject of considerable interest to every owner of an automobile, because the automobilists had all heard that he intended to build a three-mile race track for their exclusive use.

In the vernacular of Mr. Devery, there was "somethin' doin'" right away. After describing where the property he intended to build this track on was located somewhere way in the wilds of New Jersey, Mr. Devery said:

"See, here, sport, don't you think Willie Vanderbilt and them fellers would just be tickled to death with a track like mine? You see, the geezers won't let them go roarin' and tearin' around the roads with these White Ghosts and Red Devils, and so where they goin' if they don't come to my track? I tell yer, sport, the idea's got to make good. It's like takin' candy from the baby. What'll yer have, sport?"

When the gentleman in the white jacket behind the mahogany produced it and just before the swinging door closed on the reporter, Mr. Devery shouted:

"Say, sport, when I get me track ready come around, I want to see you. There'll be somethin' in it for you. Understand?"

Recent Incorporations.

Kittery, Me.—The Bonton Automobile Co., with $500,000 capital, nothing paid in. The officers are: President, Horace Mitchell, of Kittery, and treasurer, John M. Heath, of Lynn, Mass.

Providence, R. I.—Goodson Electric Ignition Co., with $10,000 capital, to manufacture magnets, spark plugs and electrical appliances of all kinds, gas engines, launches, automobiles, motor cycles and vehicles self-propelling. The incorporators are John M. Walton, Otto Carlborg and Royal H. Gladding.

Logansport, Ind.—The Western Motor Co., with $400,000 capital, to manufacture gasolene engines. The directors are Robert Parker, E. A. Rutenber, F. B. Wilkinson, E. H. Wolcott, J. F. Digan, G. E. Kessi, George W. Funk.

Cleveland, O.—American Motor Carriage Co., with $500,000 capital, to manufacture motors propelled by electricity and compressed air.

Jersey City, N. J.—Sterling Power Vehicle Co., with $1,000,000 capital, to manufacture automobiles, etc. Incorporators, R. H. Dana, J. F. Jewell and G. H. Taylor.

WANT LICENSE LAW

Legislature of This State to be Asked for one —Supervision of Construction, Too.

In so far as the Automobile Club of America and the National Association of Automobile Manufacturers, through their committees, may be held to speak for the automobilists of this State, a licensing law, to apply to owners and users of the motor vehicle, will be advocated and asked of the legislature of this State.

It is even proposed to go further and ask for a supervision of the manufacture of automobiles, at least so far as brakes and other safety appliances are concerned.

The committees of these two organizations met at the club rooms of the A. C. A. on Monday evening.

The sentiment in favor of license and of supervision of automobile construction was unanimous, those present favoring control by the State, with reciprocity among the States in recognition of one another's licenses ultimately in view.

A. R. Shattuck and W. W. Niles represented the club in the conference, and S. T. Davis, jr., F. M. Lande and H. Ward Leonard spoke for the manufacturers. Mr. Shattuck was chosen chairman of the committee and will call another meeting of the joint committee two weeks hence.

The discussion was merely preliminary and informal, and no precise form of legislation was decided upon for advocacy. It was agreed that license would be a safeguard against accident and result finally in securing more reasonable speed limits. Supervision of construction in the way of compelling sufficient brakes and improved safety appliances were also advocated.

A State commission, to be appointed by the Governor, which should name and control examiners in various counties, was suggested. The question of the revocation of licenses for violation of highway laws was a detail not touched upon.

Meanwhile the municipal ordinance introduced in the board of aldermen at the instance of the highway committee of the League of American Wheelmen slumbers in the former body.

Worcester's New Club.

A new automobile club has been formed in Worcester, Mass., in place of the old one, which for some time has been afflicted with innocuous desuetude. The constitution of the old club has been adopted. The officers of the new organization are as follows:

President, George B. Cutting; vice president, Dr. R. M. Garfield; secretary, H. E. Shilands; treasurer, J. A. Harrington; chief marshal, F. S. Taylor; board of governors, Dr. R. M. Garfield, F. S. Taylor, B. A. Robbins, T. J. Toner, Alexander Bowler, O. M. Savals and Frank Goddard.

Was a Minute Late.

By a fine splitting of hairs the committee in charge of the recent Reliability Trials of the Automobile Club of Great Britain has fixed the official rating of the White steam carriage at 1,799 marks, or one short of a perfect record. The penalty was inflicted for the heinous crime of taking one minute in excess of the time allowed for cleaning at the garage. By this ruling the Wolseley, a British car, has the honor of being the only one of the contestants to reach the coveted 1,800 mark. The proverbial fondness of the Briton to "win, tie or wrangle" is thus once more evinced.

An Automatic Tank Filler.

Little things count for much in the general sum. Who has not growled at the length of time required to fill the gasolene tank and the necessity for giving the operation constant attention?

The little device illustrated is designed to obviate all this. It is a tank filler, which also acts as a filter for the gasolene and screws on to the gasolene can when the stopper is removed.

When in position the filler is inserted in the tank and the can turned upside down. The can drains itself dry if the filler is made the lowest corner, and not a spot of gasolene is wasted. When the tank is full no more gasolene flows from the can, as when it reached a certain point the air bypass into the can is stopped, and, the pressure in the tank being greater than in the can, the flow ceases. The filler is made with and without a tap, as shown in the illustration. With the tap the flow may be stopped at any moment, and the can turned right end up without spilling a spot of gasolene.

Races at St. Louis.

In connection with the St. Louis, Mo., Fair, a number of automobile races will be run this week, the events to be under the auspices of the St. Louis Automobile Club. The complete program is as follows:

Tuesday, October 7—Race, five miles; for steam, gasoline or electric machines; not more than 10 horsepower.

Wednesday, October 8—Special race, one mile, open to the world, for steam, electric or gasoline machines.

Wednesday, October 8—Handicap race, five miles, for gasoline machines only.

Thursday, October 9—Race, five miles; speed contest. Manufacturers, dealers and agents excluded. For steam, gasoline or electric vehicles.

Thursday, October 9—Motor cycle handicap, five miles, for motor cycle machines, open to the world.

Friday, October 10 Race, open to the world, ten miles, championship endurance race, for steam, gasoline or electric machines.

Saturday, October 11—Race, steam machines only, five miles.

TAKE YOUR CHOICE

Of the Two Kinds of Testimony—Jury Mulcts Automobilist. However.

A suit that is attracting an unusual amount of attention, and is fraught with great importance to automobilists, is now being tried at Trenton, N. J. The plaintiff, Joseph M. Hughes, asks for $50,000 damages from Felix Warburg, for injuries inflicted by a runaway of his (Hughes') team, caused, it is claimed, by Warburg's automobile at Long Branch, N. J., last summer. Both the parties to the suit are wealthy business men of New York.

The testimony brought out was of the most conflicting character. Witnesses for Hughes stated that Warburg's vehicle was going at eight miles an hour, while others were certain it was sixteen miles an hour.

John H. Sparrow, Hughes's coachman, who was injured, was positive that the automobile was going at a rate of more than eight miles an hour. He declared that by glancing at a machine for two seconds he could come within half a minute of its speed.

Dr. J. B. Reed testified that Mr. Hughes suffered an injury of the spine from which he would never recover, and that his nervous system was shattered. Dr. R. B. Kimble testified that he found no permanent injury to Mr. Hughes's spine.

Miss Riley, who was riding with Warburg at the time of the accident, testified that the automobile was driven very slowly along the Ocean Drive and that it had come to a full stop before Mr. Hughes's horses made their wild dash into the Seabright Inn.

Her testimony was corroborated by Charles Martin, the chauffeur.

A dozen coachmen and other eye-witnesses of the accident later contradicted the testimoney given in Mr. Hughes's behalf earlier by either averring that at the time of the accident the automobile was standing still or moving at a very slow pace.

Several of the witnesses who examined the wrecked vehicle testified that had the yoke strap on the pole of the Hughes coach been sound the accident would have been averted. One of the witnesses testified that the leather in the yoke strap was rotten.

On Tuesday the jury returned a verdict for $12,500 in favor of Hughes.

In view of the excessive damages awarded and for other reasons, the American Automobile Association will appeal the case on behalf of Warberg. President Scarritt made a statement to this effect Wednesday.

Hussey Leaves Cadillac Co.

Patrick Hussey, who but recently joined the Cadillac Automobile Co. of Detroit, Mich., as superintendent, suddenly severed his connection there last week.

ROADS OF TARRED SLAG

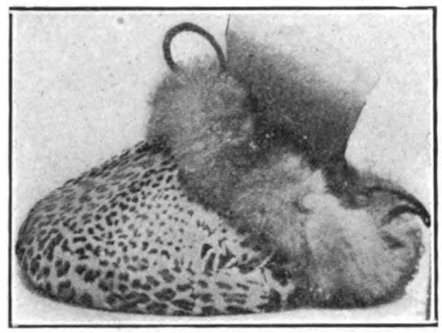
They are Expensive, but Make an Almost Ideal Highway - The Process.

"The present system of road repairing is as follows" says a practical road builder:

"The road is disintegrated or 'opened' at the outsides to receive the covering (unless this is done the new patch is never secure); in some districts the road is scarrified, and thus further disintegrated, the new material is then placed on the surface, and if a roller is available the whole is then well rolled, and when smooth the process of making the material bind or stick has to be carried out. This is generally done by thoroughly watering the surface, binding the same with sharp road scrapings and forming a thick sticky mass, which is swept into every crevice and the whole rolled until it is consolidated. It will thus be seen that water and dirt form a very large and important part in road making, and, however well one may try to get a perfectly consolidated road, this water and dirt cannot form a wear resisting surface, it cannot keep the wet out of the road, and it cannot stand so as to defend itself from the weather and atmospheric influences.

"With this course of procedure carried out it is only necessary to imagine a few days' traction engine or any other kind of traffic that will 'lick up' the surface, and the result will be easily understood, for unless the road is waterproof the material underneath becomes saturated, and is always subject to wet soaking in after every shower, or, worse still, after every continued spell of wet weather. When followed by frost the result is almost too fatal to imagine, and certainly disastrous from a financial point of view to deal with.

"As to the remedy, very many efforts have been made to find a material strong enough to bear heavy traffic, not to be more slippery than possible, and to be capable of being made into a road that would present a weatherproof face and obviate the use of the water and dirt compound now used as 'bind.' The use of tarred material has been the idea that many surveyors have worked on, but the results have only too often been most disheartening. It has been found next to useless to tar granite or syenite, because the material itself would not absorb the tar; the result has been that after forming the road well to start with, exposure has caused the tar to melt, wear or disappear, and after a short while the road has become not only rough through disintegration, but, from a surveyor's point of view, a hopeless failure. Many sorts of material have been tried for tarring, but they have almost always been found either too soft to stand traffic, though they would absorb tar, or too hard to absorb tar, while hard enough to stand traffic. The writer after repeated trials has found that the most satisfactory material yet produced is furnace slag of the very best hand picked quality, but unless this is well warmed and perfectly dried before being used it has too often been a failure. The cost of drying the material is very great, and the process is such that if the work is to be relied on special floors must be constructed, and all the material has to be turned and turned again by hand labor at least five times, so that each portion shall receive its proper quantity of tar. It will easily be understood that the area required for this drying process places it out of the question for any extended use of the material.



"With this explanation the writer thinks it will at once be seen that tarred roads, according to present methods, must be expensive, slow in manufacture and too often unreliable, but when once properly made certainly answer admirably and fulfil all that seems required. When the tarred material is made the saving in the construction of the road is great, for no sweeping dirt or watering is necessary, dust and mud are reduced to a minimum, loose stones are unknown, and the damage to the face by traction engines is not appreciable, while for ordinary traffic or motoring the road is ideal.

"The writer is pleased to turn to the result of some patient hard work and to be able to state that he has, he hopes, overcome the question of expense and floor space in the manufacture of tarred materials. He has found out how the whole of the expense of drying slag as well as the making by hand labor can be saved, viz., by having the material tarred just as quickly as it is broken and the whole made reliable by being regulated in its manufacture by machinery, instead of being left entirely to the discretion, or want of discretion, of the mixer.

"The financial result will be easily appreciated when the writer can confidently state he can make perfectly tarred slag roads at the present cost of an equal quantity of ordinary granite or syenite material untarred; that the cost of consolidation will be about one-half the present cost, and that the life of the road will be at least five, if not ten, times as great as the present road, while from the general public point of view the great reduction, if not the total abolition, of dust, mud, the prevention of the irritation that is caused by constantly repairing roads, and the improved sanitary condition of the roads themselves will be almost inestimable."

To Keep the Feet Warm.

Adequate protection of the extremities is a matter of the first importance, as automobilists speedily learn. The boot cover shown

is intended to be worn over ordinary boots. It can easily be slipped on and off, and does not interfere with the free use of the control pedals.

Cannot Bar Automobiles From Druid Hill.

In spite of the fact that the Maryland Legislature last winter took the matter out of their hands, the commissioners of Druid Hill Park, Baltimore, are still endeavoring to exclude automobiles from certain roads in the park. For several years they succeeded in barring them altogether, but a section of the act referred to changed all that. It reads as follows:

"The Board of Park Commissioners is authorized and empowered to regulate the speed of vehicles and equestrians within one mile of the approach and within the limits of said parks and squares, and to impose the fines provided for in the preceding section for the violation of any regulations it may establish in this connection, to be recovered as therein provided; but the said Board of Park Commissioners shall have no power to pass any rule or regulation excluding automobiles from the free use of the parks, squares and roadways under its control; nor shall the said Board of Park Commissioners have authority to pass any rule or regulation requiring vehicles, equestrians or automobiles to travel at a slower rate of speed than six miles per hour."

Last week the commissioners asked the city solicitor for an opinion as to their right to exclude automobiles "or other wheeled vehicles of that character" from either of the roads on either side of the duck lake in Druid Hill Park, or from passing around the Druid lake drive.

The solicitor replied quoting the act, and adds significantly: "If this section had been brought before the board the necessity of asking any opinion upon the subject would have been avoided."

Two Timely Tips.

When a battery or accumulator becomes run down to such an extent as to refuse to produce a spark an ignition spark of sufficient power may often be obtained by setting a passenger to vibrate the trembler with the fingers. Such a method has been found sufficient to run the car a distance of a mile or two.

A good temporary repair to leaking water pipes or radiators is effected by covering the pipe around the fracture or joint with white lead and binding with tape. The tape should be well smeared with the lead as it is wound round the pipe, the edges of the bandage being well leaded. When dry this makes quite a good repair, and one which which has been known to last for a considerable time.

EXHAUST VALVE TROUBLES

Some of the Causes to which They are Attributable—Bad Designing.

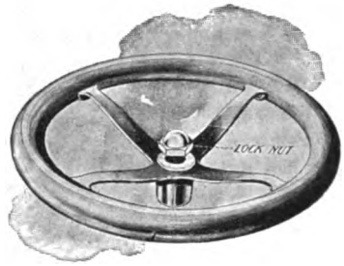
"Though much has been written on the causes of exhaust valve breakages, one reason has rarely, if ever, been mentioned," says a well posted automobilist.

"Among the explanations usually given are: (1.) Weakness in the neck between head and spindle. But the proper form for this important point is so familiar to engineers that breakage from this defect ought never to occur. (2.) Unsuitable material. This also should not figure as a cause of failure. Though less common, probably the better practice is to make the valve head and the spindle of different material. (3.) Faulty methods of valve fitting. The method of lift adopted should be such that the lifting contact (the lifter) remains always at right angle to the valve spindle. Departure from this principle tends to strain the spindle and produce uneven wear. (4.) Throttle of the exhaust by insufficient area in the valve, the exhaust pipe, or the silencer. Any defect here may lead to broken valves. With choked exhaust the pressure left in the cylinder, combined with the spring, may produce serious hammering of the valve on its seat. In time this leads to brittleness and fracture.

"But all these causes have been so often discussed, and are so well understood, that there is no longer any excuse for their existence. Another cause, however, of very different nature, is now suggested as a probable source of much of the irregular wear and ultimate fracture of exhaust valves. Those conversant with the construction of horizontal plunger pumps will recognize a defect frequently found in otherwise well designed machines. This is the placing of the valve seat on a level with the waterway.

"The effect of such an arrangement is that not only is the discharge greater on one side than on the other, but the water, diverted into a new direction while in the act of passing the valve, exerts a tilting force on it, pressing the valve towards the waterway. The results are irregular wear, sticking and hammering of the valve on its seat.

"Now the usual disposition, in the vertical motor, is similar—a horizontal port with a vertical exhaust valve, the latter seated on a level with the former. An analogous state of affairs is thus established—a flow of gas, in lieu of water, being diverted into a new direction while passing the valve. There is, therefore, the same unequal discharge with the similar tilting action, and tendency to force the valve from its true position. But there is this difference. In the pump the stroke is comparatively slow, the flow tardy, the pressure low, the valve, spindle, seat and guides cold, and in the best condition to resist wear; whereas in the motor the valve beat is extremely rapid, the gas flow swift, the pressure high, and all surfaces so highly heated as to be in the worst condition to withstand attrition and deformation.



"Thus the evils of bad design in the pump are much aggravated in the case of the motor, the tilting action being greater, and the irregular burning and side wear more rapid. The remedy in both cases is the same. The valve seats should be kept respectively below the waterway or the gas passage, so as to permit the flow of water in the one case to rise upward until clear of the valve before taking a new direction, or the rush of gas in the other case to acquire a straight downward course before reaching the valve. All tilting action is thus eliminated.

"Naturally, the usual precaution of fully equal area in the annular space round the valve to that of the valve outlet must be preserved."

Steering Wheel Construction.

The general use of steering wheels on motor cars makes their construction of interest, an example of which is here shown in the wheel made by Charles E. Miller, 97-101 Reade street, New York.

The rim of the wheel is built up from three plies of rock maple each having a

varying direction of grain, thus insuring a very rigid construction and a true circle. The spider, or web, is made of brass, highly polished, with a heavy hub. The arms of the web are engaged by the use of heavy gauge brass screws. The hubs are bored ⅞ inch standard, with ¼ inch keyway, but are designed to permit 1⅛-inch bore. The hexagon cap nut of polished brass adds a finished appearance, and serves the purpose of a lock nut.

The wheels can be furnished in natural hard oil finish or in a very durable mahogany.

Technology Instruction.

At the London Polytechnic Institute there will be given during the coming winter session a special course of instruction on the technology of carriage and motor car building and drawing. Facilities will be offered so that students may gain an insight into the mechanical properties and the various means of transmitting power to the road wheels. The workshop construction will include making drawings and working through them, the students in the day school connected with the Polytechnic being now engaged in the construction of the body of a four seated motor car, while the Polytechnic School of Engineering has nearly completed a steam motor for the carriage building school.

ITS CAUSE AND REMEDY

Side Slip Discussed by a Practical Automobilist—What Not to Do.

"There appears to be an idea that side slip is unavoidable, and also that when it occurs one is absolutely helpless to meet the emergency and must abide by the result. Now this is by no means the case, and it is a great pity that such ideas should be allowed to go uncontradicted, since they are calculated to give a very erroneous impression as regards the safety of the automobile," remarked an automobilist.

"Side slip may roughly be divided into two classes: (1) The side slip which occurs when one is going fast over a treacherous and greasy road, and (2) the side slip which occurs when one is going slowly. In the former case it is safe to say that no one but the driver of the vehicle is to blame, as to travel at a high rate of speed over a greasy surface is the height of folly, and one usually finds that the driver in this case has absolutely no notion of how to treat a slip when it does occur; in all probability he will apply his brake, the result being that the vehicle will turn completely round and crash into anything or anybody in close proximity. If a driver is going to be foolish enough to travel fast over a greasy road let him at least treat the slip in the best possible way. He should withdraw the clutch, so that the vehicle is only running by its own impetus, and then do his best with the steering.

"In the second case, when a vehicle is proceeding at a slow rate of speed, a side slip is only likely to occur in the presence of sloppy tram lines, or in the event of the vehicle being a badly designed one. In the first case, owing to the slow speed at which one is travelling, no harm is likely to result, seeing that the slip can easily be righted; in the second case, viz., with a badly designed vehicle, a slip may take place on almost any occasion if the road is at all greasy, and especial attention may here be drawn to the designs of different automobiles.

"If a car is to be free from side slip it should have its wheel base proportionate to its power and speed, and (what is most important) its body should not overhang the back wheels—that is, the body should not project out beyond the rear wheels. There is no danger to be feared from side slip if a properly designed vehicle is used, which is also driven with proper care and consideration. The sudden application of the brake on a greasy road is always liable to swing the back of the vehicle round."

Electric connections should always be kept as clean as possible, and where not otherwise protected should be covered by wrapping with rubber tape, as supplied by any electrician.

THE CASUALTIES OF THE WEEK.

(Continued from page 43.)

New Haven, Conn., conductor and two passengers of trolley car injured in collision.

OCTOBER 2.

Albany, N. Y., John McGuire struck by trolley car; killed.

Brooklyn, N. Y., Mrs. E. Wells fell from trolley car and fractured both wrists.

Bangor, Me., Frank Fish, aged 7, trampled on by horse; will probably recover.

Newark, N. J., Fannie Stevens struck by trolley car; badly bruised.

New York, Mrs. Reybold knocked down by cab; badly bruised.

Providence, R. I., John Grimes badly burned by coming in contact with live wires; may recover.

Greenfield, Mass., two men were killed and five injured in collision on Boston & Maine Road.

Bloomfield, N. J., J. R. Conlan, carriage struck by trolley car; will probably die.

Boston, Mass., Geo. Walters, aged 8, leg caught in carriage wheel and torn off; may recover.

Parkersburg, W. Va., two men killed and five hurt by collision on B. & O. Road.

New York, G. Van Glahn and Alfred Fisher thrown out and bruised by collision between their carriages.

OCTOBER 3.

Rawlins, Wyo., engineer and a number of trainmen were seriously injured in train wreck.

Boston, Mass., John Tobin, a painter, fell from staging and fractured arm in two places.

Boston, Mass., A. L. Johnson struck by trolley car; concussion of brain.

Cohasset, Mass., John Murphy came in contact with third rail; will die.

Eastport, Me., three-year-old son of F. Rufus was run over by farm wagon; died.

Milford, Mass., Mrs. E. S. Draper thrown from carriage owing to horse becoming frightened by trolley car; badly cut and bruised.

Long Island City, N. Y., unknown man struck by trolley car and killed.

Washington, D. C., Engineer Perdue and Fireman Keys killed in collision on Penna. R. R.

OCTOBER 4.

Melena, Mont., two men were killed and seven injured by collision on Northern Pacific Road.

Williamsport, Pa., Engineer Wheeland and Conductor Stringer were killed and Fireman Shaffer was seriously injured in collision on Erie Road.

West Newton, Mass., E. Huston struck by cab and severely cut about head.

Boston, Mass., Jacob Lewis, aged 8, run over by a team; sustained abdominal injuries.

Newark, N. J., A. M. Martigicomo run over by a cart; killed.

Anderson, Ind., John Walsh struck by trolley car; killed.

OCTOBER 5.

New York, Charles Hearne fell on third rail of Brooklyn Bridge; killed.

Jersey City, N. J., Wm. Sullivan struck by Erie train; killed.

New York, Mary Tracy fell while skating on rollers; died.

New York, Mrs. Mary Gorman struck by trolley car; removed to hospital.

New York, Howard Rupp struck by elevated train; killed.

Batavia, N. Y., Sherman Reed and wife killed by explosion of oil stove.

AUTOMOBILE ACCIDENTS.

OCTOBER 1.

Pittsburgh, Pa., Florence O'Neill ran into a pile of sand and wrecked his vehicle. He was thrown out but not injured.

OCTOBER 2.

New York, Victor Newcomb struck by an automobile; injuries said to be serious.

OCTOBER 4.

Brooklyn, N. Y., Jos. Costa, 16 years old, struck by an automobile; received scalp wound and contusion of left foot.

BRIEF NEWS NOTES

Fred C. Dickerson has severed his connection with the Munger Tire Co.

An automobile race meet for Buffalo, N. Y., is talked of, to take place at Kenilworth Park.

Mohler & De Gress, Long Island City, N. Y., have removed to larger quarters, at 390 Webster avenue, that city.

The sum of $450 has been granted by a British association for research into the resistance of road vehicles to traction.

It was a Foster steam carriage which W. H. Moore, of Watertown, N. Y., used with such marked success on his recent tour, and not a gasolene car.

A dividend of 10 per cent has been declared by the Daimler Motoren Gesellschaft, of Canstatt, Germany, out of profits of a little less than $100,000 on a year's business.

A line of motor 'buses is to be put in operation on the island of Corsica. The route will be between Vico, Ajaccio and Sartene, and both passengers and the mails will be carried.

The Pittsburg (Pa.) Department of Public Safety has contracted with a Chicago firm for an automobile hose wagon. It will, when completed, accompany the steam propelling fire engine now in use in going to fires.

In addition to its line of steam cars, work on which is now in progress, the Meteor Engineering Co., Reading, Pa., is engaged on a gasolene model. It is hoped that this will be ready in time for the show in January.

The judiciary committee of the Milwaukee, Wis., common council has been censured by the Milwaukee Automobile Club for recommending a speed ordinance without permitting the local automobilists to be heard.

For the benefit of foreigners the Touring Club of France has decided to erect sign posts at all dangerous gradients on roads, with indications that can be understood by all nationalities. Arrows painted on the sign mean, if diagonal, go slow; if vertical, to get down from the automobile; if horizontal, that there is a dangerous curve in the road. The information is equally good for cyclists.

At the entrance to the grounds of the Essex County Country Club, West Orange, N. J., the following notice has been posted: "Automobiles not allowed to use the road. Enter club grounds by Mount Pleasant avenue or Northfield road."

Because an automobile is alleged to have caused the death of a horse in Lansing, Mich., Alderman Dodge, of that city, has given formal notice that he will introduce an ordinance for this purpose at the next meeting of the council.

Instead of the Hansen Automobile Company, the makers of the Cleveland runabout and touring car will hereafter be known as the General Automobile and Manufacturing Co. The new address of the makers is 1312 to 1330 Hamilton avenue, Cleveland, Ohio.

Accumulators, when fully charged, will register 4.6 volts. This will soon drop to 4.4 volts, which is their normal capacity. They should never be run below 3.8 volts, or the plates are liable to become damaged by buckling. Always test with a voltmeter.

Another race meet was held at the Minnehaha Driving Park, Minneapolis, Minn., last week. Seven races were run, two of them being for motocycles, the others for automobiles. Prizes were also given for exhibitions of driving by both women and men drivers.

In addition to its efforts to bring about a uniform system in the spacing and number of lugs for single tube tires and rim sections for double tire tubes, the National Association of Automobile Manufacturers has undertaken to bring about the adoption of a standard for solid tires.

An English M. P. prophesies that farmers will, in order to accustom them to automobiles, have to breed for nerve as well as stamina, shape and action. They would then need to enlarge their prize lists by classes for nerve, which he believed would excel the leaping competitions in interest and excitement.

Not only is a bad impression given to the public by the absence of mufflers, but in traffic horses are undoubtedly far more apt to be frightened by the noise of the explosions than anything else. Squeaking brakes are also a great nuisance, and a mere drop of oil would cure this without impairing their stopping qualities.

A result of the fact that the Mexican Minister of Public Works is a motoring enthusiast is said to be the cause of the recent schemes for the development of roads in Mexico. All the highways in the federal district of Mexico City are to be put under thorough repair, and new roads of a length of 124 miles are to be built.

GIVE TWO VERSIONS

Hackman Says he was not to Blame for Collision and Wants Damages.

Charges and counter charges of contributory negligence mark a case which is being tried in the Roscoe, N. Y., Municipal oCurt, in which an automobile and a team of horses figure.

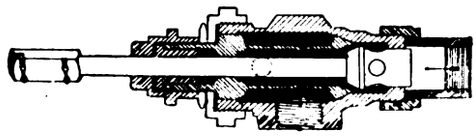
Suit was brought by Luther E. Mull, a hackman, against Park Densmore, who he alleges caused his team to run away by handling his automobile carelessly. The hackman demands $375 damages for injury to one of his horses and the wrecking of his coach.

The accident which gave rise to the suit occurred on August 28th last. Mull alleges that at 6 o'clock in the evening on that date his team was standing in front of his home on Hickory street securely tied. The team was facing east and Densmore came along in his auto from the west. Mull states in his complaint that Densmore had a steam automobile and that he was running it at a "great and unlawful rate of speed." He further alleges that the exhaust was open and that the machine produced a noise "uncommon and terrifying" to horses.

When the auto was alongside, the horses were so terrified that they broke from their fastenings and dashed down the street ahead of the automobilist. After traveling some distance Mull says the team struck an obstruction and one horse was injured so badly that he could no go any farther and the animals came to a stop. It is alleged that in addition to the injury to the horse the coach was completely wrecked.

The plaintiff states that all of this could have been prevented by ordinary precautions and that it was purely the negligence and carelessness of the defendant which caused the accident. An itemized bill of damages is presented as follows:

Damage to coach, $225; loss of double harness, $50; damage to horse, $10; for coach hire while damaged coach was being repaired, $75; for two nights' loss of work, $15; total, $375. Judgment is asked for this amount.



In answer to the complaint of Mull the defendant makes a general denial. He denies every allegation in the complaint and states that negligence on the part of the plaintiff contributed to the accident and that it was not solely due to negligence on the part of the defendant.

Alcohol Exhibition at Barcelona.

An international exhibition is to be held in Madrid in October next, says El Autovolismo Illustrado of Barcelona, in furtherance of the use of alcohol for lighting and for motor power purposes. It will be under the patronage of King Alfonso XIII. The communications received from France and Germany lead the promoters in Spain to hope for a large number of foreign exhibitors, and that all the really practical inventors will also be represented. The sites will be gratuitous, and exhibitors will have no other expenses than those of transport and installation. The Spanish railway companies have promised their lowest terms; while the Chamber of Commerce will also give its warmest support to the exhibition.

Acme Safety Throttle.

Operators of steam vehicles sometimes experience difficulties in getting regular steam admission with an ordinary quick opening throttle, which has a tendency to either open to its full capacity or to close up entirely. When these conditions come about they not only give the vehicle an unsteady movement, but they are wasteful of steam. To overcome these troubles the Nolte Brass Co., of Springfield, O., is making the Acme safety throttle, here shown. The valve is provided with double seats, the steam passing from the bottom through a cylindrical stem that is bored with four holes. The steam passes through these, thus throttling it at the lower seat to insure a gradual supply. Steam then passes around the stem and through the upper seat to the engine. When the engine is running the upper seat, which is the closing seat, is at all times full open, thus causing little wear at this point. The regulating is all done at the lower seat through the four holes.

In operating, the valve has its full capacity when the hand lever is midway between the extreme forward and backward positions. When starting, the lever is thrown full forward, and then gradually worked back toward the centre. The vehicle should be controlled in this forward half of the two extremes. Accidents from excitedly working the lever the wrong way are avoided, as the steam is entirely shut off at either extreme point.

Care should be taken to see that the thread on the pipe making the connection is not under size or cut so long that when screwed into place the pipe touches the stem on either side or interferes with the oil cup in the back. The pipe connections are one-half or three-quarters inch. The valve can be set in either vertical or horizontal position. The packing is compressed with a gland and the nut locked. There is a boss on the back of the valve that can be tapped for an oil cup, if desired. To remove any grit that has become imbedded in the seat both the valve seat and the stem can be removed without disconnecting any pipes. Valves are packed and tested to 300 pounds pressure, and are made of bronze steam metal.

After six months' work, a St. Louis, Mo., engineer has just completed a five horsepower machine, with a speed of 18 miles an hour, entirely the work of his own hands.

DELIVERY WAGON TEST

British Club has one Under Contemplation—A Mistake Builders Make.

"For some time the Automobile Club of Great Britain has had under consideration the advisability of holding a trial of motor vehicles suitable for use as delivery vans. Many important trials have been held by the Liverpool branch of the club, and by the War Office, of motor vehicles suitable for carrying heavy loads. No complete trial has, however, hitherto been held of vehicles suitable for the rapid transport of loads of not more than about a ton," says the Car.

"Some commercial houses have been induced to use motor vehicles for delivery purposes, with the result that they have come to the conclusion that motor vehicles are useless for this purpose, owing to the fact that they have been supplied with vehicles the engines, frames and gears of which were originally designed for luxury carriages to carry four persons, but which have unthinkingly been adapted for the far more trying work of delivery vans, by the simple substitution of a van body for a passenger body. Such experiments are doomed to failure, seeing that considerable strain is imposed upon a delivery van by the frequent stopping and starting, and also in consideration of the fact that it is not likely to receive as delicate treatment at the hands of a van driver as it would receive at the hands of a private owner.

"The majority of makers have had their works fully occupied by making cars for passenger vehicles, and have not given attention to the important branch of the motor business connected with light delivery vans. It is believed, however, that a serious trial of delivery vans be announced to take place, say, about twelve months hence, and makers be supplied with specifications of the two or three classes of delivery vans which are required by the big houses in various parts of the United Kingdom, they would be willing to turn their attention to the design of manufacture suitable for vehicles for the purpose.

"The committee are therefore inviting the leading commercial houses, railway companies and chambers of commerce to co-operate by sending representatives to a conference in November, and by subscribing to a trials fund, so that really substantial prizes may be offered for competition."

Contests Stimulate Business.

Nothing better shows the value of scheduled events for motor vehicles than that the week after the Ardennes race, orders for eighty of one make of vehicle were given by different private purchasers, who had been waiting to see the results of the race before deciding finally.

Digitized by Google

The Week's Patents.

709,859. Motor Vehicle. Walter C. Baker, Cleveland, Ohio. Filed Feb. 14, 1902. Serial No. 94,021. (No model.)

Claim.—1. The combination in a motor vehicle, of the body, the running gear including the rear axle; and a motor, said motor being supported mainly from the rear axle and means for attaching the motor to the body of the vehicle, said means comprising a rocking bar pivotally secured to the under side of the vehicle body, and hangers pivotally secured to the opposite ends of the said rocking bar and pivotally connected to the motor, substantially as set forth.

709,866. Carburetter. Edouard Bouchaud-Praceiq, Angouleme, France. Filed Mar. 29, 1901. Renewed Aug. 26, 1902. Serial No. 121,095. (No model.)

Claim.—A carburetter comprising a receptacle completely filled with porous material adapted to retain hydrocarbons and which is pervious to the passage of air to form a combustible mixture, and a cock consisting of two concentric tubes, the outer one being stationary and having a helicoidal opening and the inner one forming the rotating plug and having a straight groove, the crossing of which with the helicoidal opening determines the level of the orifice, whereby said level can be varied by the turning of one tube relatively to the other.

709,877. Motor. Charles J. Cullen, Jersey City, N. J. Filed Nov. 14, 1901. Serial No. 82,330. (No model.)

Claim.—1. A motor comprising a fixed crank shaft, a plurality of cylinders mounted to rotate around the crank shaft, pistons in the cylinders having connection with the crank of the crank shaft, a two section driving shaft, and compensating gear connections between the driving shaft sections and the cylinders, substantially as specified.

709,949. Valve Gear. Paul H. White, Indianapolis, Ind., assignor to White Steam Wagon Company, Indianapolis, Ind., a Corporation of Indiana. Filed Oct. 3, 1901. Serial No. 77,375. (No model.)

Claim.—1. In a valve gear, the combination of a pair of eccentrics, a pair of straps and eccentric arms mounted on said eccentrics, a pair of valves, intermediate connections between each valve and one of the eccentric arms, means for engaging and guiding each of said eccentric arms, and means for shifting said guiding means so as to simultaneously and coextensively affect both of the eccentric arms.

709,959. Vehicle Tire. Frank P. Brining, Westgrove, Pa. Filed Feb. 14, 1902. Serial No. 93,992. (No model.)

Claim.—1. A felly having an annular groove formed in the same, a ring of soft rubber secured within said groove, undercut grooves formed in the walls of the groove, a rubber tire, beveled edges or tongues formed upon the tire adapted to fit within the undercut grooves, an opening formed through the tire, a slit formed from the opening to the inner face of the tire, beveled surfaces formed upon the outside of the soft rubber ring, beveled surfaces formed upon the inner face of the rubber tire adapted to fit upon the beveled surfaces of the ring, substantially as and for the purpose specified.

710,026. Lubricator for Explosive Engines. Carl W. Weiss, New York, N. Y., assignor of one-half to August Mietz, New York, N. Y. Filed Aug. 13, 1900. Serial No. 26,713. (No model.)

Claim.—1. The combination with an explosive engine having a chamber in which a partial vacuum is produced by the rearward movement of the piston, of an oil receptacle, a conductor to deliver oil from said receptacle to a port in the cylinder wall, said receptacle being below said port and said conductor terminating in said receptacle below the surface of the oil, and a vent from said port to said chamber whereby the flow of oil is induced by the partial vacuum in said chamber, substantially as shown and described.

710,203. Acetylene Gas Lamp. Arthur K. Miller, New York, N. Y. Filed Oct. 26, 1898. Serial No. 694,586. (No model.)

Claim.—1. A lamp comprising two vertically disposed receptacles placed side by side, interposed connections securing said receptacles together, one connection having a bore, a tube connected with and depending from said bore to conduct gas, and a burner connected with said tube, a cock to control the passage of gas from said tube to said burner, the other connection leading to said receptacles having a cock to control the passage of water through said connection, substantially as described.

710,204. Acetylene Gas Lamp. Arthur K. Miller, Waterbury, Conn. Filed Jan. 13, 1900. Serial No. 1,263. (No model.)

Claim.—1. A lamp comprising a pair of receptacles, braces secured to said receptacles near opposite ends, one brace having a bore communicating with both receptacles near their lower ends, the upper brace having a bore communicating with one receptacle, a tube extending between said braces and communicating with said upper bore, a burner connected with a bore in the lower brace, said tube communicating with the last mentioned bore, and means to control the passage of water between the receptacles, substantially as described.

710,274. Tire for Wheels. Everett Horton, Bristol, Conn. Filed May 28, 1902. Serial No. 109,313. (No model.)

Claim.—1. In a resilient tire for wheels, the combination, with an inner rim, of a segmental rim composed of segments having longitudinal ribs and grooves on their sides; springs interposed between said rims; and plates carried by the inner rim, and having flanges fitting over the ribs formed upon the segmental rim and entering the longitudinal grooves thereof.

710,278. Electric Battery. Timke H. Klinker, jr., and Richard Gabrielsky, Jersey City, N. J. Filed Apr. 5, 1902. Serial No. 101,605. (No model.)

Claim.—1. In an electric battery the combination of an inclosure, a positive electrode having upwardly projecting tubular members rising from a bottom thereof, a chambered negative electrode suspended in the centre between the upwardly projecting members of the positive electrode, and an exciting filling in contact with the said electrodes.

710,302. Internal Combustion Engine. John A. Prestwich, Tottenham, England. Filed Apr. 29, 1902. Serial No. 105,165. (No model.)

Claim.—1. The improvements in internal combustion engines comprising the combination of a compression cylinder, a working cylinder, a piston in the compression cylinder, a piston in the working cylinder moving in advance of the piston in the compression cylinder, a rotary valve, an air admission port in said valve coinciding at the proper time with an admission port in the compression cylinder, a discharge port in said rotary valve coinciding at the proper time with a discharge port from the compression cylinder, and a compressed air admission port to the working cylinder, an oil supply valve

VICTORIOUS AT HOME AND ABROAD.

The White Steam Carriage

WINS OUT IN ENGLAND'S RELIABILITY CONTEST.

True to its former showing made in this country, a WHITE STEAM CARRIAGE completed the 650 miles test with

AN ABSOLUTELY CLEAN RECORD,

being one of two out of seventy entries to achieve this distinction.

The conditions of this run were unusually severe, the competing vehicles being required to make five separate journeys over different routes, and submit to brake contests and hill climbing trials.

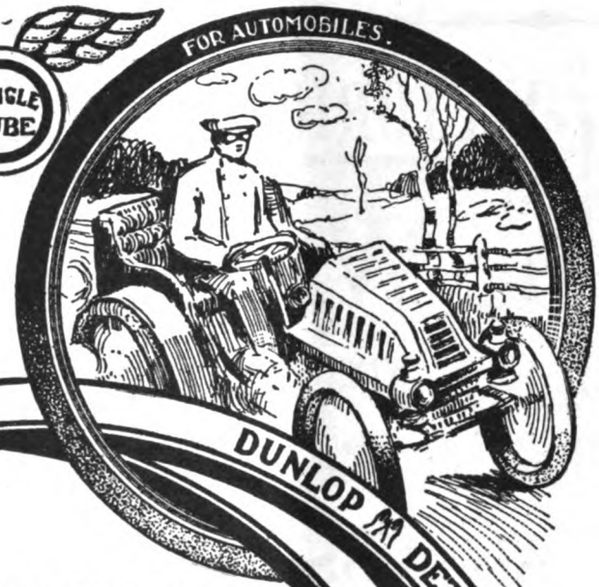
The WHITE STEAM CARRIAGE used was a six horse power vehicle taken from stock and not only scored

1800 POINTS OUT OF A POSSIBLE 1800,

but demonstrated its fuel economy by using only 13 quarts per day.

Both its track records for speed and its road records for reliability prove that

THE WHITE IS A THOROUGHBRED.



WRITE FOR FULL PARTICULARS, INCLUDING PROF. THURSTON'S REPORT ON OUR STEAM GENERATOR, AND THE OFFICIAL REPORTS OF IMPORTANT ENDURANCE CONTESTS.

HARTFORD
and
DUNLOP TIRES

Have Stood Pre-eminently Foremost Since the Introduction of Pneumatic Tires

Few devices have been the subject of a greater inventive faculty or more persistent and successful exploitation, and few have reached such a high state of development.

They Never Vary in Quality or Workmanship Because They Cannot Be Made Better or of Better Materials

If the BEST is none too good for you, it will pay you to adopt these widely and most favorably known tires. Every user is bound to be satisfied with them.

True Economy Represents Buying the Best Wherever You Can Find It

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.

Volume V. New York, U. S. A., Thursday, October 16, 1902. No. 3

PACKARD WILL MOVE

Detroit Men and Money Secure Control, Form a new Company and seek new Site.

Warren, O., is shortly to lose both the famous Packard car and the Messrs. Packard, whose name it bears.

All rights and property of the Ohio Automobile Works, under which name the Messrs. Packard and their associates operate, have been acquired by a new company, made up mainly of Detroit (Mich.) capital. The new company will start with a paid in capital of $500,000. The works will be continued at Warren, O., until a site can be obtained in Detroit, when the plant will be removed to that city and operations continued on an increased scale. It is the intention of the new company to increase the output tenfold.

The Detroit men in the company are Russell A. Alger, jr., Fred M. Alger, John T. and Truman Newberry, H. E. and R. P. Joy, Charles A. Ducharme, D. M. Ferry, jr., Willard C. and Philip H. McMillan and Joseph Boyer, many of them names that stand high in Michigan and are well known outside the State. The new board of directors will consist of Truman Newberry, Harry E. Joy, George L. Weiss, Philip H. McMillan, Joseph Boyer, R. A. Alger, jr. The Messrs. Packard will continue in charge of the enterprise.

In confirming these details Harry E. Joy, who carried a Packard car through the reliability run to Boston, stated that it is the intention of the new company to elect officers as soon as he returned to Detroit.

Grant in Trouble.

On the application of Mrs. John McKeown, of Washington, Pa., the Franklin Trust Co. has been appointed receiver for the Grant Tool Co., of Franklin, that State. Mrs. McKeown's claim amounts to $160,000; other liabilities aggregate $70,000. The assets are placed at $550,000. The Grant Tool Co. was formerly the Grant Ball Co. of Cleveland, Ohio.

Change in Remington Management.

James S. Holmes, Jr., has resigned his position as general manager of the Remington Automobile and Motor Co. of Utica, N. Y., to take effect Nov. 1st. Mr. Holmes has accepted a responsible position with a New York concern entirely outside of the automobile trade. Frank P. Hilton has also resigned as treasurer of the same company. Malcolm Graham, who has been associated with Mr. Holmes as vice-president of the company, will assume the management, and E. J. Otis will become treasurer and general superintendent.

Whitney Files two More Suits.

Two more suits have been brought by the Whitney Motor Wagon Co. of Boston for alleged infringement of patents on steam vehicles. The concerns proceeded against are the Prescott Automobile Co., Passaic, N. J., and Grout Bros., Orange, Mass. The suits are similar in character to those brought within the past year against several other makers of steam carriages, and involve a large number of claims. One of the most important of these is the adjustable chain strut, which is in such general use.

More American Cars for Foreigners.

The Houk Automobile Co., of London, England, has secured the exclusive English agency for the International Motor Car Co.'s line of Toledo gasolene and Waverley electric vehicles. George W. Houk, the head of the company, closed the deal while in this country.

Show for Philadelphia.

Philadelphia will have a local show. It already has been set for the first week of February and the Second Regiment Armory engaged. Messrs. Le Cato and Schlichter, who conducted the previous show in that city, are promoting the affair.

Benjamin's new Berth.

C. A. Benjamin, for a number of years with the Locomobile Co. of America, has been appointed general sales agent of the H. H. Franklin Mfg. Co. of Syracuse, N. Y.

TO ST. LOUIS IN 1904

Chairman Scarritt Advances a Novel Idea Which Meets With a Favorable Reception.

It is not wholly improbable that the year of the St. Louis Exposition, 1904, will witness the reliability run of that period headed not east, nor north, but west—headed, in fact, for the Exposition itself.

The idea was launched by that man of ready wit and resource, Winthrop E. Scarritt, in his speech at the smoker tendered the "reliability runners" at Springfield on Monday night. At the time the suggestion was well received; after discussion served only to strengthen its first reception, making it appear that the 1,000-mile test which it implies would not lack the entries and interest necessary to its success.

"My idea," said Mr. Scarritt, pointing in the direction of St. Louis, "is to say in substance to the contestants, 'There's St. Louis. Get there.'"

He then amplified the suggestion in this wise:

"I would reuire the operator to choose his own route, feed himself and his observer and cover the course in not less than ten days nor more than fourteen. He must secure his own gasolene and make his own repairs. The observer's record will tell the details of the trip."

Receivers Obtain Money.

The United States Court has granted permission to the receivers of the American Bicycle Co. to issue receivers' certificates to the value of $500,000. They will be cashed in this city and the proceeds applied to the accounts of the International Motor Car Co. and the Federal Mfg. Co., two of the Bicycle Co.'s subsidiaries.

Gets Nineteen Counties.

The Miller-Mundy Motor Carriage Co., Utica, N. Y., have secured the agency of the Autocar Co., of Ardmore, Pa., for 1903, for territory embracing nineteen counties in New York State.

ALMOST A RIOT OF RELIABILITY.

The A. C. A. Contest Develops so Many Equally Superb Performances that the Chief Award is a Matter of Monumental Speculation—Unofficial Figures Show 20 Cars are Tied for It—Of 75 Starters, but 7 Fail to Survive—The Story in Detail.

While there is, and can be, no assurance of its correctness, the most reliable information obtainable makes it appear that the following vehicles earned perfect scores and are tied for the chief award, the President's Cup :

Nos, 1 and 3, Packards. No. 5. Prescott. No. 7, Lane. No. 11, Haynes-Apperson.
Nos. 24, 25, 26 and 28, Whites. No. 31, Stevens-Duryea.
Nos. 33 and 61, Grouts, Nos. 42, 67 and 76, Fournier-Searchmonts.
Nos. 47 and 48, Knoxes. No. 64, Oldsmobile. No. 68, Fredonia.
No. 70, Foster. 20 in all.

There have been other runs, here, there and abroad, but none quite like the six days' reliability run, or contest, or whatever you care to call it, which came to a close at Fifth avenue and Fifty-eighth street, New York, on Wednesday evening last at about the time Old Sol began to pull down his shades for the night.

Designed by the Automobile Club of America as a public demonstration of the reliability of American motor vehicles, the demonstration proved of a nature that should serve to carry their fame around the world. Mindful that the year had witnessed great strides toward perfection, the promoters had imposed rules and restrictions that made their previous attempt—last year's run to Buffalo—appear a mere helter-skelter. The vehicles proved themselves equal to the rules. Of the 75 that left New York on the morning of the 9th, 68—or better than 90 per cent—completed the 488 miles that made up the route to Boston and back. It is a record of which American makers may well be proud.

Of the 68 there were those that had had their troubles—troubles that had involved stoppages, and stoppages that had incurred the infliction of the dreaded loss of points. But the 68 demonstrated their ability to "get there," and there is great glory in that. There was never an automobile contest anywhere that developed such a large proportion of vehicles of the sort. Of the number of those that came through with "clean scores" no man or publication can speak with authority or with any show of it. The number guessed at ranges from 22 to 17, but until the observers' books are tabulated they will remain guesses and nothing more. The tabulation may or may not be completed by Saturday next. This is the word that comes direct from headquarters.

And when the tabulation is completed and made public, put up your umbrella! Unless all signs fail, it will be followed by a storm. There were many constructions of what constituted a penalized stop, and there were interested free lances with sharp eyes and pencils as sharp who were not taking notes for personal amusement. More than one observer is not unlikely to be called on to defend himself. The rule which states that "one mark will be deducted for each minute the vehicle is at rest" is the rock on which several with less than sixty second stoppages have threatened to make a stand to secure the much desired perfect score. Whether on a hill a car should falter and roll backward, and then get going forward, without coming to what most people would term a rest—an occurrence that happened several times—should be debited with one stop, two stops or no stop at all was another fine point that was seriously discussed. It is such things as these that may make necessary the warning to keep umbrellas handy.

Chairman Scarritt Surveys the Situation.

The start of the contest was not unlike the start of all automobile contests. There was the same collection of big cars and little cars, of red, white, blue, black and yellow cars; the same noises, the same smells, the same crowd of bustling officials—sans ribbons on the arms this time—the same corps of police, the same click, click of cameras, the same surging, babbling intermixture of observers, operators and spectators, and apparently more of them than ever before, all with the same background, the palatial Vanderbilt mansion. Few of the old familiar faces were missing. President Shattuck strode dignifiedly here and there, Chairman Scarritt was not only here and there but everywhere, and Secretary Butler, besieged on all sides, tried hard to make progress in the face of the volleys of questions fired at him. Of course, Ben Smith was there, and Frank Weston, and Charles E. Miller,. and Kenneth Skinner, and W. D. Gash. Wherever and whenever automobiles gather there they are ever to be found; Gash this time had in tow Robert C. Ogden and J. S. Bunting, powers in the great Wanamaker institution. There were other new faces, too. Thomas B. Jeffery, who has not aged one year in twenty, was on the scene for the first time, deeply interested, of course, in his Rambler cars. Theodore Weigle, from the Akron factory of the Diamond Rubber Co., chubby and chipper, was there; James B. Becker came on from Clyde, O., to keep his eye on his Elmore, and there were others.

Ten minutes after the last car had left, however, what had been a scene of unusual hubbub assumed the wanted appearance of a New York street.

The story of the ensuing six days—they followed the Biblical injunction and rested in Boston on Sunday—is a long one. The details of the doings of each day are chronicled in other columns. In striking contrast to last year's run the weather gods were good. They wept on but one day—Sunday, when there was nothing doing, and no harm and little inconvenience resulted. Last year the contestants wallowed in mud for four days; this time it was dust, not mud, that worried them.

"In fact," said Windsor T. White just after he finished, "I'm the least bit sorry that we did not have one day of hard rain; it would have made the test more severe, and that would have just suited us."

It is violating no confidence to say that

Digitized by Google

the severest strain to which most of the men and their machines were subjected was the strain of keeping within the 14 mile an hour limit. There were those that gloried in being in front and in getting there and remaining there, they ate up time and distance so quickly that to avoid reaching controls ahead of the schedule what might be termed "trick riding" was necessary. They would slow down to a snail's crawl, and at that pace cut letter S's and zigzag from side to side of the road or street. One of the contestants once avoided a stop, and also possible disqualification, by thus skilfully creeping a mile in some 40 minutes—no small feat in itself. On repeated occasions it was not an infrequent sight to see 50 or 60 slowly moving vehicles strung out as regularly ordered as if on parade.

There were more tire troubles than the roads warranted, but, generally speaking, the other troubles were minor ones. Except-ing the "also rans," a broken piston on No. 71, De Dion; broken bolts on the transmission of No. 29, gasolene Locomobile, and a badly buckled wheel on No. 19, Automotor, were the most serious occurrences to any of the cars that completed the run. In a way the most unfortunate of the survivors was F. A. La Roche. On the first day his troubles with his Darracq began, and they continued until Boston was reached. There he dis-

What was Accomplishe .

Out of the chaos existing at present regarding the specific results of the reliability contest, which came to an end yesterday, little beyond generalizations can be indulged in at present.

It is known that some 20 cars are claimed to have a clean bill of health, having come through the six days' run without a single penalized stop. For this we have the word of the observers, reinforced by the contestants. But whether all these claims will be borne out by the unimpeached testimony of the books is quite another matter. At best there are many mooted points, raised in entire good faith, which must be settled before any award is made. In the process of revision the list is likely to be shortened somewhat.

If we turn to the certificate winners we are still more completely at sea. It is no exaggeration to say that, compared to it, the marking contest is simplicity itself. It is probable that a considerable majority of the finishing cars will be awarded first class certificates, and that most of the remainder will get second and third class ones. But beyond this it is utterly impossible to go.

We have a list of the arrivals and departures from each of the twelve controls, which, of course, gives us the time consumed by each car in covering the distance between them. But we do not know, and cannot for some time, the causes of the delays, where such occurred. They have been due to tire troubles or to other non-penalized stops, rather than to slow running. In such case they would not interfere with the award of certificates.

But if information of this precise character is unobtainable, it is not so with that bearing on the run itself.

THE WEEK'S CASUALTIES.

TOTAL: KILLED, 172; INJURED, 277.

RAILROADS:	Killed, 141.	Injured, 129.
TROLLEYS:	Killed, 19.	Injured, 79
HORSES:	Killed, 11.	Injured, 57.
BICYCLES:	Killed, 1.	Injured, 10.
AUTOMOBILES:	Killed, 0.	Injured, 2.

TOTAL, THREE WEEKS: KILLED, 252; INJURED, 470.

It was a magnificent, an overwhelming success.

Nothing like it has ever been witnessed in this or any other country. It completely dwarfs every event of the kind ever conceived and carried through.

Of the 75 cars which left New York on Thursday last 68 reached the starting point last night.

The simple statement is worth volumes. It is true that some of the 68 cars had met with accidents en route, and that others finished with difficulty. It must be said, too, that in the matters of roads and weather the contestants were greatly favored. A run of this distance could not be held under more favorable conditions. Everything conduced to the making of an almost unexampled record.

But this is very far from being all. No extraneous circumstances would have availed to bring about such a result had there not been a basis to work upon in the shape of well designed and soundly constructed cars, operated with intelligence and skill.

There were bad roads in plenty, although few of the indescribably vile ones which marked the run to Buffalo last year.

Over them the cars were run for mile after mile at a pace that was usually quite up to the 14 mile limit. Uphill and down dale, following deep ruts, plunging into holes, ploughing through mud, sand or loose dirt, they rarely faltered and never failed.

That more than 90 per cent of the starters should finish is, therefore, a remarkable showing. Not a whit behind it is the small number of accidents that occurred.

The broken axles, steering knuckles, springs and other parts, so great a figure in last year's run, was almost unknown. There was no rebuilding of cars over night, no procession of factory hands en route, by railroad trains and on cars, no carrying of huge repair kits, no shipment of trunks of parts from point to point. Blacksmiths were not compelled to work all night or routed out of bed and set to work forging straps and rods with which to bolster up falling cars.

Instead there was order and quiet at the controls as well as en route.

The operators were, as a rule, their own mecanicians. In the case of the big cars a mecanician was usually carried along, and he attended to the work of lubricating, replenishing tanks, cleaning up and adjusting. But with most of the smaller cars it was just the other way. The time allotted for repairs—an hour and a half at noon and two hours in the morning—was nearly always more than was needed. The cars were lined up ready for the start anywhere from half an hour to an hour and a half before the word was given.

A marked difference between the present run and that of last year was also seen in the objects sought.

Last year every effort was bent in the direction of getting through. No expenditure of time, effort or money was deemed too great if this purpose was achieved. No check was kept on the number, duration or character of the stops or of the repairs. Those in charge of the cars had an absolutely free hand in all these particulars.

Clean records were what were sought on the Boston run. Getting in, and even getting in on time, was a secondary consideration with most drivers. They knew how easy a task that was. But to come through

Digitized by Google

without a penalized stop, or with as few of them as possible, was the desire of their hearts, and to its accomplishment they bent every effort.

There were few cars brought into the controls solely by the almost superhuman efforts of their occupants.

The latter, except the drivers, took things easy, and acted precisely as they would have done had they been out for a little jaunt of a few miles. Many of the observers had sinecures. There was little for them to do, and most of them did it well.

The run demonstrated incontrovertibly that single day's runs of 75 to 100 miles a day are too short to make a real test of the cars of to-day.

They must be sent further, if anything not already known is to be made public. We now know that almost any reputable car can start off for a day's or a week's journey and arrive at its destination with certainty, and almost without trouble.

Higher flights may now be attempted, and it has already been more than intimated that they are contemplated.

The object of the run has been accomplished. The reliability of the contesting cars was made plain beyond misunderstanding. They are reliable, and can be relied upon to carry their passengers to destination without stops or troubleof any kind.

The Clouds Begin to Break.

This is the broad, luminous, inspiring beam which comes from the New York Evening Sun:

"The time is not far distant when the alleged comic papers will have to give up printing the tiresomely familiar picture of the automobilist scattering death and destruction in his wake. Even the embattled farmers will have to reconcile themselves to the resources of civilization."

It appears beneath the caption, "The Automobile Question Settling Itself," which in itself conveys a great truth, for, as the Sun says:

"The demand for legislation on the subject of the speed limit of automobiles, with severe penalties for those who exceed it, has died down. There have been much fewer accidents recently, and as the number of horseless carriages is increasing every day it is clear that either chauffeurs are becoming more careful or the horses are getting accustomed even to the red, white and blue devils, as their ancestors ceased to shy at railroad trains and electric streetcars."

It cannot be otherwise. The automobile is merely the "juggernaut" of to-day. Yesterday it was the bicycle. To-morrow it may be the flying machine, the suggestive dangers of which are so enormous and so picturesque that the automobile will be quickly lost to view once the sensationalist turns his pen to them. He will then have the same public which now shudders at the shadow of an automobile fairly quaking at the possible consequences of the sudden flop of an airship.

It serves to show the folly of what the Sun in its wholesome editorial tritely terms "the absurdity of vindictive special legislation," in which, unfortunately, too many automobilists are prone to share in some measure.

"While little minds discuss, great questions solve themselves," is an aphorism that aptly fits the present situation. The automobile question is a question of the sort.

Philadelphia Folly.

We confess that we fail utterly to appreciate the reasoning of some of the men and organizations whose avowed purpose is to serve the cause of automobilism. Here in New York we find some of them favoring the examination and licensing of automobilists without distinction, and in Philadelphia last week others of the same class gave evidence of the same tendency toward favoring special legislation and unnecessary and unduly rigorous impositions.

The Philadelphians constituted a committee from the Automobile Club of that city to a joint conference designed to draft an ordinance satisfactory to all vehicular interests. When all was said and done, the automobilists had agreed that while fines of $5, $10 and $25 were sufficient penalties in the order of the offence for violations on the part of other vehicles, it is right and proper that automobilists be mulcted $25 for the first offence and be denied the right to use the highways for a second transgression.

Not to make light of justice by mentioning it in connection with the matter, what earthly rhyme or reason there can be in such an agreement, even in Philadelphia, is absolutely incomprehensible. It is simply pandering to popular prejudice and lending color to newspaper headlines, of which the automobile is a victim, and adding strength to the carefully nursed and too popular supposition that it is a demon on wheels.

To us it seems that all these special exactions and discriminations will some day return to vex and injure the motor vehicle interests, which just now most require a few strong men who will suggest or agree not to special laws, but who will plead in no uncertain language for that equal and exact justice which is supposed to be meted out to all regardless of their stations in life.

The common law applicable to all vehicles is sufficient for automobiles; their rights should be no less, their penalties no more. Offences committed with a self-propelled carriage are not more heinous than those which involve horse drawn vehicles. Automobilists and automobile clubs should be the last to make it appear otherwise, which is exactly what the Philadelphians have done.

The Touring Spirit.

Were the question asked of even the most casual observer, what has been the notable feature of ownership and use of the motor car this season, there would be the direct and positive answer: Touring.

Those of us who have read the authors of olden times have been entertained and made to now and then wish that we lived in those days, to have enjoyed the pleasures of travelling by the four horse coach that we might see the country as it really is. In place of this we have taken our in-transit sight-seeing through the limited confines of the railroad car window, and then seeing but the edges, never knowing the thrill of sweeping up hill and down dale, through picturesque settlements and by farmyard gates. Never approaching towns through their clustering beginnings, with their yards and gardens, only running into them, via rail, through cluttered scenes of freight sidings and by the back ends of factories or refuse dumps.

Some of us have had a taste of the pleasures of road scenes by touring on bicycles, but these were limited by time and by our physical ability to travel distances. It was only with the coming of the motor vehicle that we really knew and fully appreciated the real charms of the old coaching days. We have yet to win back the roadside inn, but with the ever increasing motor vehicle touring that has been this year so splendidly introduced that, too, will once more become a feature to add to the picturesque conditions of the whole and to our mundane pleasures.

Then hail to the automobile as the means to teach us the pleasures of the road and to make us acquainted with our country.

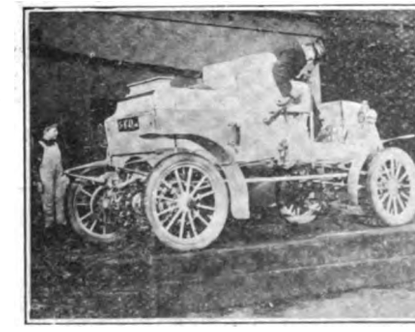
ALMOST A RIOT OF DURABILITY

(Continued from page 67.)

covered two steel balls in his cylinder; he attributes their presence to a discharged employe. The reporters who followed the run, and whose business it was to seek out the troubled ones, led a strenuous existence. As the week wore on the desire to conceal information and to—to lie—became contagious, while some of the red capped individuals who were paid to act as checkers, and who retained the checking sheets, became what can be best described as "chesty." On the road the desire to hide troubles was also apparent, and the means employed was often ludicrous. On several occasions men were seen to drop tools and begin fingering the tires. Once this was done by one of the party on a car, unmindful that the operator was to be seen lying flat on his back at work under the vehicle. There is small doubt, however, that most of the troubles causing stoppages were comparatively trivial. Even on the last day several otherwise clean scores were spoiled by unusual and mentally distressing causes. C. H. Paige, in an Oldsmobile, for instance, accidentally touched the spark controller with his glove and thus shut off power. One of the Whites was halted by some cotton waste blowing, or in some way catching, in the burner and being set afire. The driver became fearful and stopped, when by simply lifting a footboard he could have removed the cause of the fire.

Thos. B. Jeffery "Sees" a Joke.

If they possessed consciences the autophobes and calamity howlers of the sensational press would be tearing their hair in agony. Despite the nearly 500 miles of travel and the many vehicles engaged, there was not an accident of any kind. Of the thousands of horses encountered few pranced and none bolted. They were no shuddering farmers, no terrified housewives, no crying children. Instead there were interested crowds and a warm welcome at practically every city, village and farm. Schools even turned out their pupils to see and cheer the speeding caravan. In one of the Connecticut towns this happened, and later one of the contestants remarked the bright, happy, wholesome appearance of the youngsters.



The President's Cup.

"Yes," responded a native of the town, "that's the children's reform school."

Theo Weigle is Tickled.

Where credit is due so many it is difficult to differentiate, but that the steamers, as the Motor World remarked some time since, have emerged from the cloud which hung about them is made evident. There was glory enough for nearly all, but that the Whites again signally distinguished themselves is not to be denied. They have done this so regularly on each public demonstration that did they fail to do so it would be remarkable. Fitted with their condensers, they went through on an equality with the gasolene cars, and made no more stoppages. It is reasonably certain that four of the five earned perfect scores, and that the fifth has but one stop debited against it. The fact that two of the five were delivery wagons makes the record more notable, and should create a healthy call for that type of wagon from the many merchants who have doubted their reliability or had unpleasant experience with other vehicles of the kind. The lone Prescott in the run behaved grandly, and the speed it developed on occasions opened some eyes, as one owner of a powerful French car was heard to admit. The Grouts likewise performed excellently. Of the gasolene cars, the Fournier-Searchmonts appear to have played the lion and made the deepest impression; all three of them are believed to have earned clean scores. The little Oldsmobile runabouts lived up to the Oldsmobile reputation, and were always in the reckoning; the same is true of the Packards and the Knoxes. The new Toledo gasolene car also made an impressive performance.

Weighing in the day before.

Robt. C. Ogden and J. S. Bunting of Wanamakers; W. D. Gash is the "offing."

The finish of the run was devoid of excitement, but was not without incident—incident that served to show the cruelty of Fate and that made amusement for the crowd, but that brought anguish to several men. When in sight of the goal, the doughty little Elmore, with two American flags flying, stopped short and was pushed across the line by its operator and observer. Who will undertake to define the feelings of Manufacturer Becker, who was awaiting it? And Tangeman and his Italian car, probably the only one in all America—a week of superb performance rendered inglorious by being towed the last half mile or so. The forlorn hope of the Locomobile—the only one left with a chance for a clean score, and the chance dashed to earth by trouble that required the car to be pushed home, tandem fashion, by another car! It was fun for the crowd. It was gall and wormwood for those whose hopes the cars carried.

NEW YORK—NEW HAVEN

Good Roads and Fine Weather Makes First Day's Run a Mere Romp—But two Contestants Fail by Wayside.

New Haven, Oct. 9.—Whatever the remaining five riding days may bring forth—and there are not wanting pessimists who declare that trouble is ahead, to-day's ride can be referred to only in superlatives.

Ideal weather, roads at their finest, management par excellence, cars that ran with almost clocklike regularity—these constitute the sum total of the day's doings. The candid recorder cannot abate one jot or title of this panegyric. It is, indeed, too good to last.

Of the 75 cars that began the journey from New York this morning all save two had been checked at the control here at 9 o'clock—one hour before the closing time. The two vehicles referred to were Nos. 44 and 74, a Darracq and a Buffalo, respectively. Both of these failed to reach the noon stopping place—Norwalk. Of these 73 cars the vast majority rolled processionlike into this city between 4 and 4:30 o'clock, most of them having dawdled along, strenuously endeavoring to kill time so as to avoid arriving in less than the minimum period. So well was this gauged that several covered the distance in the exact time permitted, less the ten minutes leeway given them. That is to say, by dint of crawling they managed to escape covering the course in faster time than an average of fourteen miles only because ten minutes was taken from their total time.

The decision of the committee to give this ten minutes leeway was a wise one, and settled what promised to become a burning question. To obtain the highest possible marking a car must average a full fourteen miles an hour for the six days; should it fall behind but a fraction of a minute it would lose a mark. On the other hand, if it exceeded the fourteen miles by the smallest margin it became liable to disqualification for exceeding the speed limit. Obviously, one horn or the other of the dilemma would have to be taken; for no driver could cut matters so fine that he would arrive at each of the twelve controls on time to the second.

To adopt the simple rule referred to was to put an end to all trouble before it had time to begin—to use an Irishism. Consequently the committee decided to adopt it, and this morning typewritten slips were given to the contestants, observers and press men, setting forth these facts. The wisdom of the step was signally demonstrated before the day was out.

Of the first day's casualties the morning run, from New York to Norwalk, 44½ miles, was responsible for the greater part. To the hills and the stone strewed roads, mending being in process in a number of places, this result was largely due.

The record shows that the majority of accidents, of stops and of cases of consuming more than the time required to make a fourteen mile rate, occurred in the morning. The worst showing was made at the start. After that the offending cars steadied themselves and struck what the optimistic are pleased to term their natural gait. Even at this, however, the showing was anything but a poor one.

After leaving Norwalk, and especially after passing through Bridgeport, the going averaged better, the hills ceased to trouble and the cars bowled along like the machines they are intended to be. The 14 miles an hour pace, the fastest permitted, became easier than ever, and no car that was anything near right failed to accomplish it. To be candid, how not to exceed it became the question, and only the most determined loafing availed to answer it satisfactorily.

Under the rules of the present contest the cars compete for a double prize—a first, second or third class certificate, and a perfect record, as computed by marks. This necessitates an enormous amount of figuring, and the work will not be attempted until the journey has been completed.

All that is being done—and this is a big advance over last year—is to issue a list of the arrival and departure of the cars from each control. This Chief Timer Thayer hands to the press men and others interested at night. From this a fair survey of the day's work can be obtained, but by no means an exhaustive one. The stops are not touched on at all, and, therefore, precise deductions, based on the lists, are quite out of the question, and generalization only can be ventured upon. That a car got in half an hour or an hour late, for example, may mean anything or nothing. A tire may have gone wrong, and the car's record then might have been a perfect one, no stops and no lost marks being credited to it.

Of those which do not come under this category the majority were of such a character that no great delay was occasioned. The majority of these follow:

The Autocar, No. 13, had a pump chain jump off and had to make one stop. The Torbenson, No. 19, had four stops, due to a broken wire and water pipe. An Oldsmobile, No. 41, had trouble with its pumps, and the Neftel, No. 50, stopped three times on account of a broken valve spring and cylinder trouble. A flooded carburetter accounts for the single stop of No. 52, a Winton, while No. 62, the Toledo touring car, assigned sparking troubles as the cause of a similar stop. Insufficient steam was the cause of the stop of No. 73, Dr. Carman's Foster steam car.

After a stop of an hour and a half at Norwalk for luncheon the first car was started on the journey to New Haven, 34½ miles. The run was uneventful to Bridgeport, over roads of a fair character. At that busy town, however, the people turned out almost en masse to greet the voyagers. At the points of vantage they were massed many rows deep and cheered vociferously, why, the Lord only knows. But they did cheer. At the turns members of the Bridgeport Automobile Club were stationed with flags and facsimiles of the white arrows used to mark the route; and without this assistance the way would have been difficult to find, for the human wall concealed the others from view. The police arrangements here were very efficient.

From this point the road became very level, and glimpses of the Sound were caught at intervals. About eight or ten miles out of New Haven, however, the course changed to one entirely along the water, which at that time of the afternoon it presented a very beautiful appearance.

Savin Rock, New Haven's summer resort, although almost deserted, was viewed with interest, partly because by this time there was plenty of time to view it. The bi-daily "loaf" had set in, and as far as the eye could reach there was a string of crawling cars that told a tale of reliability that was singularly gratifying. The control was finally reached, and the cars run into the garage and the key turned on them.

Going through Larchmont the first experience with unfriendly authorities was had. The town is marked with signboards stating that the automobile speed laws will be strictly enforced, and to show that this was not an empty boast several officers were posted along the route within the corporate limits.

Most of the cars slackened their pace upon coming to the first sign, but this was not always sufficient to please the zealous guardians of the village peace. Uplifted hands were frequent, although not a team was in sight, and the few houses were widely scattered. Nothing more than warnings were given, however.

Arrangements had been made for a good luncheon at Norwalk, and it was duly provided—for the first comers. These, with tradesmen and press men, who went by train, sat down to a repast that from soup to pie was worth all and more of the 60 cents that was charged for it.

But the late comers were not so fortunate. They found the tables crowded, and if they waited until they could secure places it was only to find that the supply of viands had given out, and that what they got looked like thirty instead of 60 cents.

At the various hotels to-night tongues clattered and the day's experiences were recounted and exchanged. Tired with the ride, many of the visitors went to bed early, but a number of hardy ones were up until past midnight, "doing" the town or otherwise enjoying themselves.

The favorite topic of conversation was New Haven, its college boys, girls—pretty and otherwise—and its hotels. The latter were damned as heartily as anything could be, and that is saying a great deal. It is simple truth to say that they would be a disgrace to a town that made any pretence of being up to date. They were, excepting the Garde, which is away from the centre of the town, small, old fashioned and inconvenient. The Tontine, in many respects the best, does not even have an elevator.

But if the hotels were lacking in these particulars they were very much to the fore in the matter of charges.

Although notice had been given of the influx that would take place, quarters engaged for the observers and arrangements made for the others of the party, no preparations had been made to receive them. Rooms were at a premium, and as the evening wore on it became impossible to do more than get a cot in some room already occupied. For these accommodations the regular prices were almost doubled.

"We pay $20 for our room," said one of a party of five newspaper men to the Motor World representative. "There are two beds and a cot in it, and it was take this or nothing."

All along the line people were complaining of the treatment given them. Observers were "doubled up," entire strangers being allotted the same room and the same bed.

"It is an outrage the way they are treating us," exclaimed Secretary Butler. "We made all arrangements in advance, and here they are breaking their agreements. They are charging almost double for accommodations."

"We pride ourselves on always arranging matters properly," said President Shattuck in the same strain, "and it hurts us to be treated in this way. Personally, I am having no trouble. I have a habit of sending my man along in advance, and he engages my room and leaves my things there, so that everything is ready when I arrive. But I feel very sorry for the others in the party."

It appears that $4 is the regular rate charged the automobilists. It does not make any difference whether there are two or five in the party—there is never less than two—$4 each is the charge, and no kicking avails to have it lowered. In fact, some of the hotel clerks act as if they would be quite willing to encounter refusals, for there are other men, travellers mostly, who would snap the rooms up.

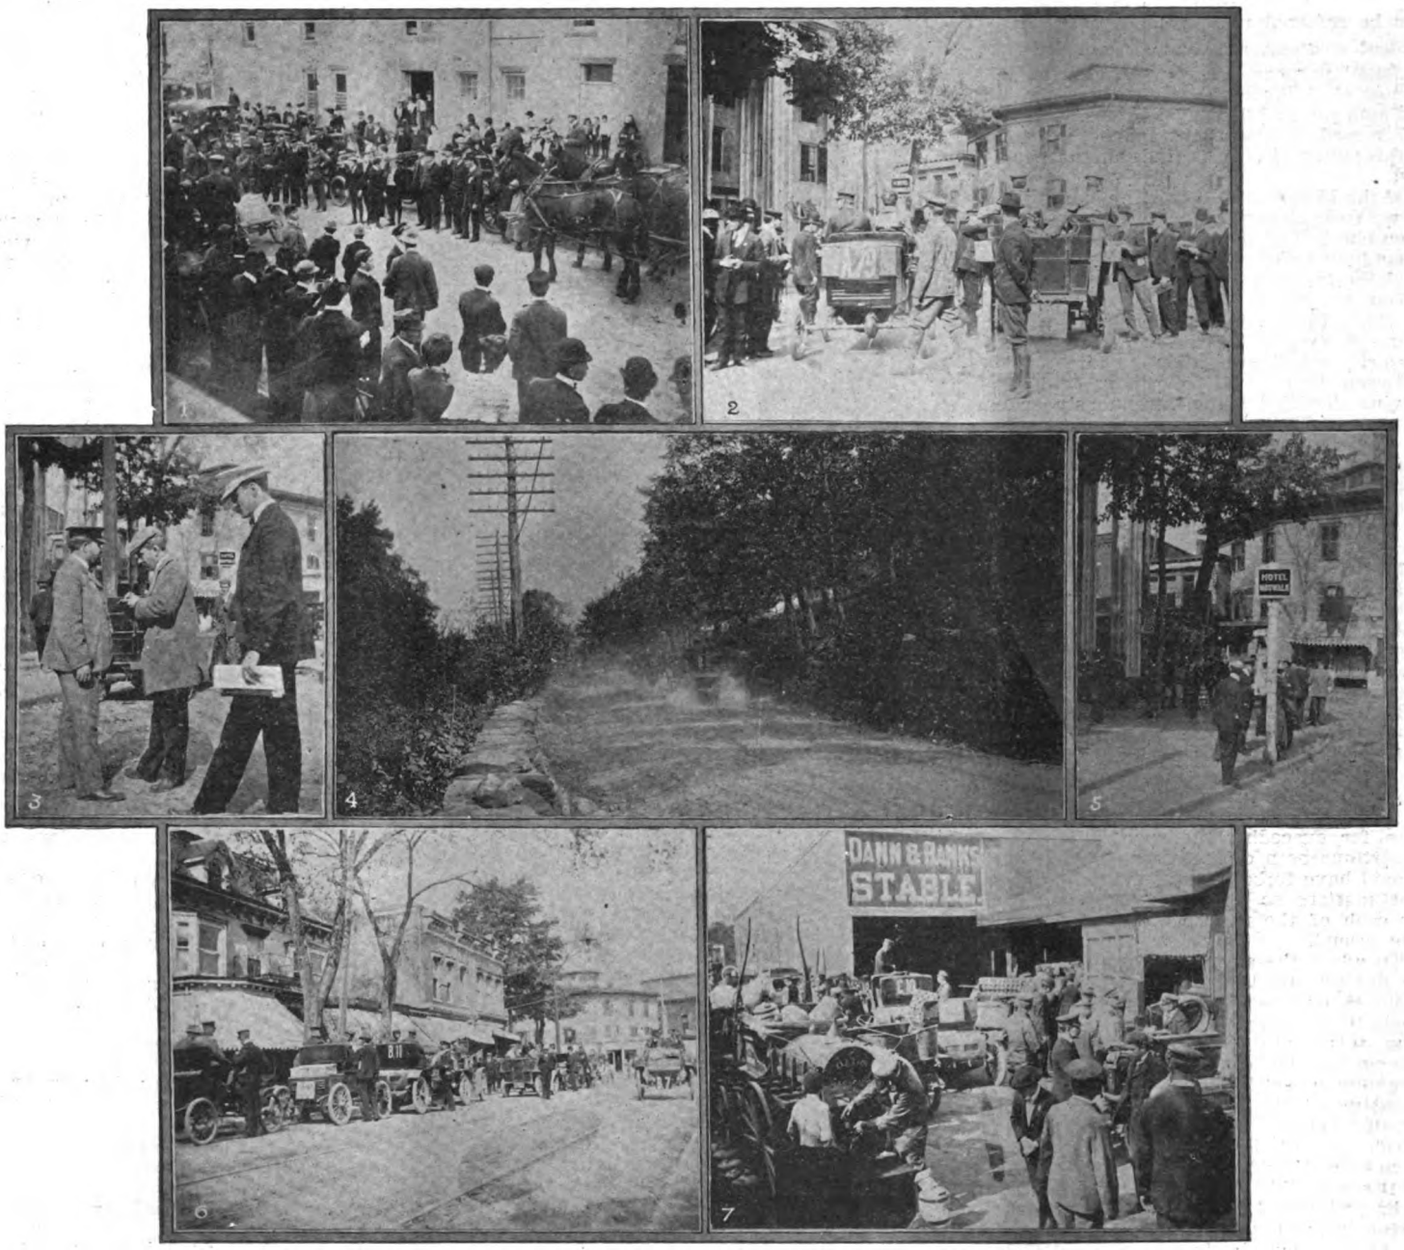
NEW HAVEN—SPRINGFIELD

Shortest Day's Run was Made With Ease—Hardest Work was to Kill Time—Entertained at Hartford and Springfield.

Springfield, Oct. 10.—A short and easy day's run has left the automobile cohorts in fine condition and almost intact. But two of the seventy-three vehicles which left New-Haven this morning remain unaccounted for.

This remarkable result was really foreshadowed this morning. A round of the garage revealed the fact that there was, in place of the wholesale repairing and rebuilding which characterized last year's run, really very little to do. From 7 to 7:30 the yard presented a busy appearance. At the former hour the doors were opened and the operators and observers were admitted, and the former permitted to enter upon the work of repairing. At 7:30, however, the cars began to pour out to take their places in line, ready for the start. At 8 o'clock the majority of the cars had left and the yard presented a deserted appearance, a full hour before the starting time.



In short, the first day's ravages were few, and a little work in adjusting, lubricating, etc., served to prepare most of the cars for the second stage. No army of mechanics, no trunk loads of spare parts, were needed. The wrong things were easy to right.

Promptly on the stroke of 9 the first car, No. 19, was given the word and got away. Then in twos and threes they were started with great rapidity, until at 9:19:45 no less than sixty cars were on their way to Hartford. One only met with mishap. This was No. 56, an Autocar, which struck a trolley car but fifty feet from the start and bent the front axle badly. It continued on its way without stopping, however.

The roads to Hartford were fine in the main, with a few sandy stretches. The latter gave very little trouble, however. The good roads were superfine, magnificent specimens of State road building, and over them the cars made fast time.

There was a great deal of dust, more than had yet been encountered. Wherever the cars were closely bunched it arose in clouds, completely enveloping cars and occupants. It was of exceeding fineness and penetrated everywhere and caused considerable inconvenience.

At 12:01 the first car was due, or 11:51 if it made use of the ten minutes lee way. It was not 11:51 when the first of a number of cars was seen coming up the hill leading to the Allyn House. Slowly they moved, and the leader, No. 64, an Oldsmobile, reached the control at 11:51:15. As it left New-Haven at 9 o'clock exactly, it will be seen that it was but fifteen seconds over the minimum time, with the lee way counted in its favor. Close after it came cars by the dozen, and it seemed that nearly all of them had been simply waiting for the time to elapse.

Blundering management on the part of the police caused a scene of confusion. Teams were permitted to mix with the oncoming cars at the controls, and in a few minutes the block was so serious that it became necessary to extend the line away down Asylum street, take the times there and dismiss them.

In spite of the excellence of the roads, the crop of mishaps was unusually large. Nearly all of them, however, were of a minor nature.

A dirty spark plug caused No. 59, a Winton, to stop. K. A. Skinner stopped two minutes to repair a broken wire. A bit of dust on the vibrater caused a bad mark to be registered against No. 32, a Rambler. Battery trouble affected No. 15, a Ward Leonard, similarly. The muffler of No. 37, an Elmore, choked and caused a stop, and No. 77, a Rambler, broke a chain, with one stop resulting. The current was accidently cut off on No. 41, and Oldsmobile, and caused a stop, and engine troubles were responsible for a fifteen minute stop of No. 29, the new gasolene Locomobile. Trouble with an intake valve caused No. 16, a Ward Leonard, to stop twice, and No. 56's, Autocar, bent axle had to be examined to see if it would hold. No. 19, a Torbenson, had four stops due to sparkling and valve troubles.

More serious were the accidents to one of the Knoxes—a broken crank shaft—and one of the Haynes-Appersons, which is reported to have gone into a ditch.

After a few minutes spent in taking in supplies, etc., advantage was taken of the courtesy of the Hartford Rubber Works Co., which extended the visitors a luncheon at the Allyn House. Everything being then in readiness, the afternoon run was started at 1:31 instead of 2 o'clock, as intended.

A short run was before the cars, only 26½ miles to Springfield. For the most part the roads were level, but not very good, being dusty and heavy in places, with a great deal of mending going on in others.

To avoid a bad place a detour was made near Windsor Locks, an extremely sharp turn to the right, down a slight hill, being necessary. During a part of the time President Shattuck and party remained at this spot and gave warning to the oncoming cars.

During much of the last part of the journey the route led along the Connecticut River. The leisurely pace at the end gave plenty of time to enjoy the waterscapes until the city of Springfield was in sight; and soon, too soon for some, the control was reached, it being south of the centre of the place, and reached almost without warning.

The second day's run has given some lines on the work of the number of the cars. Considerable fencing has been going on between K. A. Skinner's De Dion and L. D. Fisk's Panhard, of the big cars, and two Olds, two Knoxes and two Stevens-Duryea of the light cars, to see which shall arrive first at the controls.

As a large number of the cars are taking it is both a fast and a slow race. Brushes take place during the early part of the runs, and then manœuvring takes place to see which can get to the timers in first place and yet without arriving there too soon. Very amusing is the work that results.

As a large numberof the cars are taking advantage of the ten minutes' leeway given them, there came near being serious trouble this afternoon. The garage is situated in the southern part of the town, a mile or more from the central business portion. Upon crossing the long bridge over the Connecticut River, Main street was soon reached, and with it the green flag denoting the timing place. As soon as the flag was seen there was begun a loafing match, compared to which all that had gone before was high speeding. In spite of all they could do some of the cars got in a little ahead of time, and their occupants are in fear or trembling lest they shall be punished.

There is small prospect of this, however. In a conversation with the Motor World man Chairman Scarritt said:

"We shall treat each case of early arrival on its merits. What we aim to do is to prevent any flagrant violation of the rule."

Later, at the banquet, he referred to the matter indirectly by speaking of the slight shortening of the course this afternoon between Hartford and Springfield, owing to repairs that were going on, stating that allowance would be made on account of it.

In marked contrast to that at New Haven was the reception of the party here. At the former place they were left entirely to their own resources. Here tradesmen, clubmen and the authorities vie with each other in extending a welcome.

Some 300 guests sat down at the Cooley House on Friday night, when the Knox Automobile Co. tendered them a banquet. Prior to it an impromptu reception was held in the lobby, and while the orchestra played popular airs the automobilists sang the choruses in unison.

Everybody was in a jolly mood. In a far corner a dozen or so congenial spirits—Percy Owen, H. W. Whipple, W. J. Stewart, O. J. Woodward, R. P. Scott and others—played high jinks. From the bivalves to the coffee hilarity reigned, and when President Smith of the Knox Co. called for order to hear the speakers all were in a mellow mood. Mr. Smith acted as toastmaster, and played the part well. In a few well chosen sentences he bade the guests welcome, and then introduced Mayor Ellis.

The latter was witty and entertaining. He told of the pleasure the visit of the automobilists gave him, in contrast to the consternation such a visitation would be supposed to cause, and said that the police had been instructed to give them all possible freedom. Concluding, he called on President A. R. Shattuck of the A. C. A.

The latter devoted himself to a resumé of the great changes wrought in three years. In 1899 there were but very few automobiles in this country—less than a hundred—while now the number could not be less than 12,000. He gave some amusing experiences connected with the famous run from New York to Philadelphia in the year referred to. Then he passed on to the subject of roads, and related what had been done in Massachusetts, praising in the highest terms the work of the State road builders. He strongly urged State supervision of road building, and said the State and not the small towns must bear the chief part of the expense incurred in their construction.

After a selection by a male quartet W. E. Scarrett, chairman of the contest committee, was called on, and spoke at some length, ranging from the humorous to the serious.

It was nearly midnight when the assembly broke up, and the entertainment was voted a complete success.

When Chairman Scarritt to-night touched on the hubs of H. W. Whipple's Packard car he made the hit of the evening. The car has attracted no end of attention, and nearly everybody is talking about it.

The ends of the hubs project nearly 12 inches beyond the spokes, and are probably four inches in diameter. The enormous nuts on the end are of brass, and as the wheels revolve the brass glistens in the sun and can be seen for a long distance. All the other drivers give the car a wide berth, for the impact of those hubs would be terrible

"It was formerly said that the universe had but two hubs, and that Boston was one of them," said Mr. Scarritt in his inimitable fashion; "but that is true no longer. Since October 5 last there have been six hubs, and Whipple owns four of them," and the shouts that followed almost shook the roof.

SPRINGFIELD—BOSTON

Over the Mountains to Worcester—Dr. Hovestadt's Car Breaks Steering Knuckles—Where the Lying Began.

Boston, Oct. 11.—The last and most astonishing of an astonishing three days came to a close in a slight drizzle of rain, the precurser, apparently, of a settled storm. The latter, even if it is over by Monday, will leave the roads in such a condition that they will play havoc with the hitherto victorious cars.

The performance of these cars during exactly one-half the journey has been little if any short of marvelous.

Out of the 75 cars that left New York no less than 72 of them came to the scratch this morning. When the control closed tonight 68 cars had been recorded by the checkers, and another, Dr. Carman's Foster, came in at 11 o'clock. To emphasize the matter still more, almost four-fifths of the cars had to "kill time" for miles into Worcester in order not to do better than an average of 14 miles an hour; and the majority of them needed the ten minutes lee way given them by the committee. This was during the control covering not only by far the longest stretch of road—52 miles—but the worst roads of the trip as well.

During the two preceding days these roads had been pictured as heartbreakers that would place black marks on many previously perfect records. But to-day proved the prophecy to be baseless. Come good, come bad, the roads mattered little; cars bowled along or ploughed through in a thoroughly satisfying manner.

Not only was the day's run thus highly successful, but it was also interesting, and a source of extreme delight to those fortunate enough to take part in it.

The same superexcellent management characterised it that has marked the entire run. Seventy cars were sent off in the remarkably short space of sixteen minutes; and throughout the entire day matters moved with equal precision and dispatch. One cannot criticise, but only marvel at the perfection of it all.

The morning came with more than a trace of dubiousness about it. Hazy at first, the sun seemed to be struggling to pierce the clouds, and with a good chance of success. But when 9 o'clock came matters were distinctly worse. There was no sign of the sun. Dull skies and a moist atmosphere ruled, and a steady rain, had it set in at any moment, would have surprised no one. As the event proved it held off until the last portion of the run and then came down but gently.

The dust so much complained of on Friday was almost entirely absent. Evidently there had been more or later rains east of Springfield than to the south of it. It was only where the cars were closely bunched that the dust was at all bad.

The same abrupt progression from perfect roads to others unworthy of the name continued during the morning. For several miles out of Springfield the way was ideal; then, without other warning than was afforded by the sight of a different appearing road, the cars bumped into a trail that seemed to have taxed the ingenuity of man to make indescribably bad—just as severely as its forerunner must have done to make perfect.

Then, and again without warning, after a number of miles of this, during which the cars plunged and ploughed and slid like so many rubber balls, the glorious smooth, firm highways would come into view, and

Digitized by Google

again the cars would again revel in their delights.

All praise to the builders of these latter roads. In his felicitous speech at the banquet last night President Shattuck remarked that not even Napoleon, when he builded roads across the Alps, nor other European masters of the art of road-building, achieved better results than had the Massachusetts Highway Commission. And he was right. It was a pleasure to merely look at their handiwork. No picture could be more beautiful. The manner in which the roads curved this way and that, to lessen the severity of the grades, the scientific banking of the turns, the perfect rounded tops of the hills—all were beyond praise.

As to the bad spots, and they were between Springfield and Worcester many and long, the least said about them the better. Frequently they were little more than trails, sandy and shifting. In places the flying cars cut in for the best part of a foot—not a straight path, nor a stable one, but zigzagging and constantly changing.

As it turned out the bad roads, instead of causing a break in the hitherto solid phalanx of cars, merely cemented them into still firmer union. Had there been openings in their armor they would have developed this morning. None but reliable cars, in good order and well handled, could have come through such an ordeal almost unscathed as they did. The few breakages merely showed what would happen when the strain became too great. It is true that an entirely different story might have had to be written had the threatened rain come; and the return journey may compel this story to be written. The sandy nature of the soil, however, holds out hope that even a hard rain will not make the going very bad.

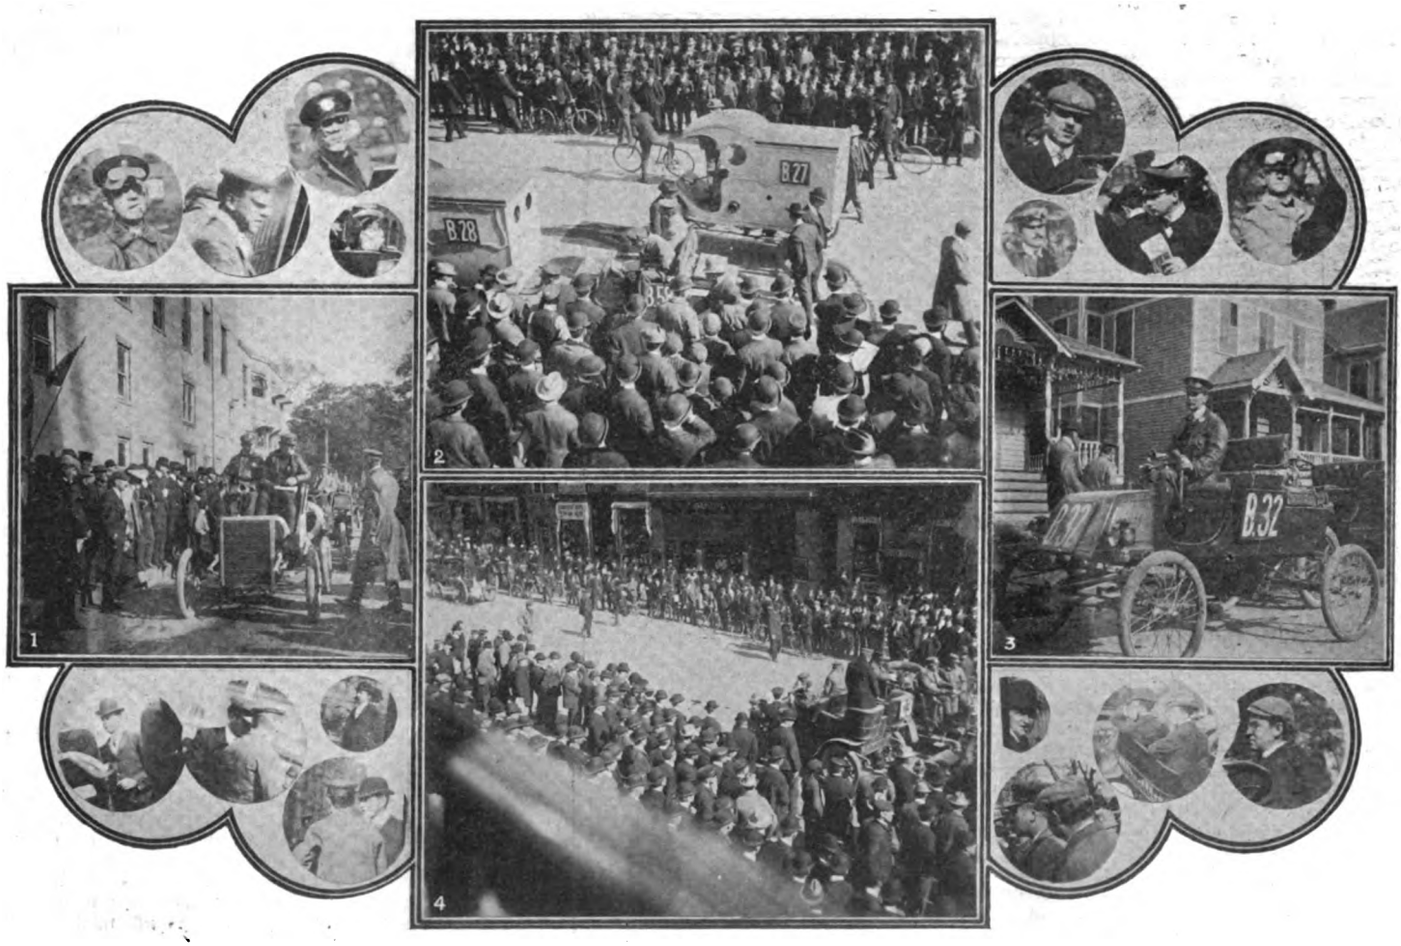
Wild and picturesque in the extreme was the country through which the morning run led. For miles no vestiges of human life were visible. Hills were on either side, with now and then a pushing stream flowing and threading the valley in company with the road. Rocks and sand, with trees and bushes, were almost the only things in sight.

In contrast to yesterday there was much hill work. That in the morning was the most trying, for it was over bad roads, and the hills were for the most part longer and steeper.

Beginning with a grade that must have been more than a mile long, for the most part straight and only moderately steep and which lay just a short distance east of Worcester, the worst of the afternoon's hills was over. Thenceforth nothing of a character to give trouble was encountered.

But on the morning run, near East Brookfield, the Nelson Hill of the run was encountered. It was absolutely unheralded. Even the first sight of it failed to reveal its true character. Only when its ascent had been begun did it stand revealed in its true colors.

Anywhere from half a dozen to a dozen and a half cars are said to have come to grief on it. Some of them stuck and had to be pushed; others were lightened of part of their loads before they could be induced to go to the summit. Of a steepness that in places probably exceeded the 17 or 18 per cent. of Nelson Hill, last year's heartbreaker, the surface, although nothing to brag of, was a big improvement over the latter, while the hill itself was much shorter. A few miles further on another exceedingly steep hill was encountered, but it proved to be not quite so formidable as the one referred to.



It would be noticed that helping hands are said to have been extended on the big hill. The qualification is made with design, as will be seen.

Mendacity of a cheerful and utterly shameless character developed to-day among the drivers and observers. Where on Thursday a desire to be truthful in answering questions was noticeable, and on Friday great candor and freedom was observed in the same direction, Saturday showed a great difference. The drivers had cut their eyeteeth, and their observers had become affected with a spirit of camaradarie that was touching to behold. Rather than reveal mishaps they lied unblushingly and with a hearty good will. A wall of brass was upreared to balk the efforts of the press men to obtain the truth. And this, seemingly, out of mere bravado or a determination to show a brave front to the enemy.

Time and again the Motor World man was met with a cheerful "no trouble," when the truth was otherwise. Incredulity secured only a repetition of the statement; expostulation brought forth an aggrieved look.

Passing the hill referred to, after about four-fifths of the cars had passed, the Motor World car was stopped to institute some inquiries. Fifteen cars were asserted to have been helped up the hill. Later the occupants of other cars related how they had seen cars thus aided. But scarcely a driver or contestant was found who would admit that they were among the number. A remarkable fact, truly.

It is only fair to say that much of the trouble on the hill was due to the blocking

Digitized by Google

of the road by cars ahead. A big foreign car (not in the contest) caused trouble for half a dozen cars by sticking on one of the "thank you marms" that abounded. A Ward Leonard car escaped being stalled by pulling over into the ditch, the observer and even the driver jumping out to lighten it, and then going around and pulling into the road again, a marvellous bit of work. Other instances of clever driving were also in evidence.

In a stern chase of 54 miles, designedly undertaken with the view of viewing the tail enders at close range, the Motor World car's occupants found little to reward them. Not until almost ten miles from Springfield had been driven was the first car overtaken, and it was moving along nicely. Just before Palmer—16 miles—came in sight the first distressed car was seen. It was No. 73, a Foster, with a broken pump. A little farther on No. 54, Dr. Hovestadt's De Dion, was met in a sad plight, both steering knuckles having snapped off, due to plunging into a sandy hole. Then came No. 65, the Automotor Company's entrant, with some trivial accident. Finally the unfortunate La Roche's Darracq was encountered near Spencer with a broken piston. These made up the list of the halt, the maimed and the blind between Springfield and Worcester, the latter place being reached before many of the cars were due there.

A long line of cars, killing time, their occupants bandying jokes, choked the road into Worcester for several miles.

Near Spencer, about 11 miles west of Worcester, a sign at a cross road indicated that the latter led to the world-renowned village of Podunk.

As at other noon controls Worcester witnessed but little tinkering. Taking on supplies, lubricating, going over important parts to see that they were all right—this usually took but a few minutes and left the drivers free to snatch something to eat and still have time to wait before the hour and a half allotted to luncheon had elapsed.

The run from Worcester into Boston was a fitting finale to the day's ride.

Flushed with the unexpected success over the dreaded bad stretch and with the thought of Boston and the completion of one-half the task in mind, the occupants of the cars were a good natured, enthusiastic lot. Free from anxiety they flew along, eating up the miles in rapid succession, and with the usual result. The last few miles were taken at a crawl, and even then the finish was cut very fine.

Following the morning's procedure, the Motor World car was started from Worcester when all but two or three of the cars had been sent off. A rapid run was made to Boston, and along the entire route not a single car was stranded, except for tire troubles.

Occasional stretches of road not up to the afternoon's standard were encountered, but nothing that could be termed bad. Nor were the hills of a character to cause trouble.

Somewhere east of Northboro the first upset in the road schedule was experienced. Where Southboro should have been reached Marlboro in some mystrious manner appeared in its place. On its outskirts an inquiry developed this much, but how or where the proper turning was missed is still a mystery. The generally accepted theory is that the ubiquitous small boy removed a sign and in its absence the autocade swept around to Marlboro instead of taking a short cut to Southboro.

The detour added several miles to the length of the run, and permitted the cars to cut out a faster pace for the greater part of the way than would otherwise have been possible.

Passing through the main street of Marlboro, where there had been a fire, the first comers had trouble getting through the fire lines, the entire fire department being lined up there. A way was cleared in time for the first contesting cars, however, and two or three miles further on the road that should have been taken was come into again. Meanwhile much anxiety had been caused, for it was plain that something was wrong.

The sight of nearly a score of the cars drawn up by the roadside, their occupants waving a welcome and bearing flags, showing that this was the Marlboro Automobile Club, relieved the tension, however, and a few yards farther on a welcome white arrow showed that the lost had been found.

From this point the cars passed towns and suburban villages in rapid succession. At Framingham Center, South Framingham, Natick and Wellesley crowds had assembled to view the sight.

At Wellesley, Boston's beautiful suburban section was entered, and little knots of people were gathered everywhere, and the sight of them and of the many handsome residences, combined with the excellent roads, more than outweighed the gloomy weather, although the lowering clouds were beginning to drop a little rain. By the time the city was reached this had developed into a drizzle, which rendered the tortuous route into the Park Square garage more slimy and slippery than a hard rain would have done.

Once more the time of arrival was cut exceeding fine. According to the schedule the first car to arrive should get in at 5.24, or, with the 10 minutes leeway deducted, at 5.14. At 5.14.15 three cars crawled up to the point where the control had been established, all in a bunch, and all getting this time. They were K. A. Skinner's De Dion, a Stearns steamer and a Ward Leonard.

It was a jubilant throng that filled the lobbies of the principal hotels this evening. Baths and the donning of such clothes as had been brought or sent along consumed only a short time, and after a hearty dinner crowds gathered and talked over the day's events or went over to the reception tendered by the Massachusetts Automobile Club.

Of the three days this one has been marked alike by the most serious and the most trivial mishaps. Two cars—a De Dion and a Torbeson—have been put out of condition, as already noted, and do not seem likely to resume. One other, a Darracq, has so far failed to turn up also. On the other hand half a dozen annoying little things, some of them the result of carelessness, have marred otherwise good or clean scores.

For example, K. A. Skinner cleaned an intake valve before the start and tightened it with his fingers only, instead of with a wrench. It came loose, of course, and he had to stop to fix it. One of the Rambler cars developed a leaky water pipe and had to make one stop to put it sufficiently to rights to let it get in to Worcester. A Ward Leonard had a spark plug break 50 feet from the Springfield control, and its first stop of the contest resulted. A Rambler had to make a short stop on account of a heated engine. The other Leonard car developed trouble with its battery and was stopped in order to fix it.

There was a great competition among the steam men, the Whites alone excepted, to get first to the water tanks at the water stations. They would dash up to them, stop suddenly, jump out with their coils of hose in one hand and drop the end of it in the tank. It would take anywhere from three to six minutes to fill up, and if a car had to wait for a place at a tank it took double the time. Consequently they were always in a hurry.

BOSTON—SPRINGFIELD

Return Journey Commenced on Muddy Roads Which dry by Afternoon—Stiffest Hill Causes Very Little Trouble.

Springfield, Oct. 13.—Up and away betimes were the great majority of the cars this morning. In view of the fact that the day's run was the longest of the return trip, and that of the afternoon the longest and worst of the two, the run committee decided to permit departures to be made at 8 o'clock. Any driver, however, had the privilege of waiting until 9 and thus finish his repairs.

As it turned out, very few availed themselves of the permission. There was the usual small amount of serious repairing, and 7:30 o'clock found many cars lined up in Columbus avenue ready for the word. By 8 o'clock there were few absentees.

Although the morning dawned with overcast skies and a heavy mist, it held out promise of a decided improvement. The rain of Saturday night and the greater part of Sunday had ceased, and a sunny day was sure to dry the roads. The latter were still wet and, before many miles had been covered became exceedingly heavy. As Worcester was approached, however, they became dryer, due to the fact that there had been less rain and that the soil was of a more sandy nature. Between Worcester and Springfield they had even improved over Saturday, although there were many mud holes.

The promise of sunshine was fulfilled, and this, combined with the balmy air and the absence of dust, made the day's ride an exceedingly pleasant one.

Taken as a whole, the day's run has been but little less successful than those of last week. The morning journey was a mere romp. An overwhelming majority of the cars pursued their usual course—made haste for the greater part of the way, and then, their time of arrival rendered certain, "loafed" in to the control. In the afternoon much the same tactics were pursued, with the exception that the cars were a little more scattered than usual.

The number of cars starting from Boston was ——. This was the result of the arrival of an Autocar and the Torbenson entry. The former had sprung a leak in the water tank near Meriden on the second day, and this caused the engine to heat and ruin the shaft bushing. Matters had been put to rights, however, and the car reached Boston yesterday. The Torbenson car had come to grief on Saturday, a deflated tire causing it to dash into a curb and buckle a front wheel rim. The rim was taken off and straightened and the car reached Boston the next morning.

At Worcester the arrivals numbered 72. An Oldsmobile reached the control, followed by nearly a score of other cars. The attempts of many of these to kill time were laughable. For more than a mile before the timing station was reached the cars literally crawled. Many were zigzagged asross the street, impeding traffic, but attaining their ends.

Only five cars made penalized stops, if their occupants are to be believed. There is no doubt that the list is really larger; but how much it is impossible to say. At least one observer is known to have stated that his car made no penalized stops, while the contrary is the case; but it is believed that his report notes the stop and that he gave such an answer out of mistaken loyalty to the driver. It may be stated here that there is widespread dissatisfaction with both the

Digitized by Google

verbal reports made and the lack of official daily statements.

Under the present method all is guesswork. The elaborate tables built up by the pressment are very vulnerable. Observers or operators frequently tell two stories, and it is possible that their reports will tell still a third. This sort of thing vitiates the findings of the pressment and throws suspicion on everything that is reported. It is pretty well recognized now that the proper plan would have been to issue nightly reports, based on the observers' books. Such a plan would be difficult to carry out, but not impossible.

That there were but few stops is pretty well indicated by the morning run of the Motor World car. It left Boston after nearly all the cars had started, and pushed on to Worcester, reaching there ahead of the first arrival. Yet but one of the score of cars passed was stopped; that was No. 43, a Packard.

When the cars came in, however, No. 43 and four others acknowledged that they had had stops. They were as follows:

No. 39, De Dion, one stop; three minutes; broken trembler.

No. 41, Olds, one stop; broken connection, spark coil.

No. 80, Foster; one stop to light pilot.

No. 43, Packard, two stops; carburetter float and clutch troubles.

No. 59, Winton; one stop, six minutes; to repair broken trembler spring.

Contrary to expectations, the road this side of Worcester was improved by the rain. The sandy nature of the soil and the hills caused the water to be absorbed or shed, and the good stretches were better than ever and the bad ones no worse.

Nevertheless, the run was a severe one, and many troubles are reported in consequence. Most numerous of these were the tire troubles. Punctures were frequent, and cars were observed by the roadside pumping tires, removing inner tubes, or in others repairing the damage. It is difficult to account for this. There was but little road mending and but few stones. Yet there were probably a score of stops solely on account of tires.

Other stops were not infrequent, as the appended list of penalized stops will show:

No. 39, De Dion, one stop; valve trouble.

No. 43, Packard; one stop; adjusting chain.

No. 79, Olds; one stop for water.

No. 61, Grout; one stop to make steam.

No. 38, Elmore, two stops, one on Leicester Hill, the other caused by apron catching in gearing.

No. 31, Stevens-Duryea; one stop; broken chain.

No. 59, Winton; one stop; broken trembler spring.

No. 29, gasolene Locomobile; one stop on Leicester Hill; engine stopped.

No. 8, Lane, one stop; valve stem lost out of the cylinder lubricator.

No. 58, Rambler; one stop; battery trouble.

No. 56, U. S. Long Distance; one stop, one hour; broken steering knuckle.

No. 73, Dr. Carman's Foster; one stop; valve trouble.

During the morning run an opportunity was afforded to view the place where almost the entire cavalcade went wrong, near Marlboro, on Saturday. Before coming into Southboro the road selected turns sharply to the left, while the main road keeps straight on alongside the trolley line tracks. The removal of the arrow caused the turn to be passed unnoticed.

Considerable trouble was expected to materialize at the 15 per cent grade leading into Leicester. The Motor World car was stopped there in advance of the other cars, and preparations were made to see everything that happened.

To the general surprise, however, most of the cars climbed the hill easily. It was a stiff climb, put perfectly straight, with no "thank you, ma'ams," and with a fairly good surface.

Three cars were unable to surmount it without a stop, viz., the new gasolene Locomobile, an Elmore and a Grout. A number of cars, probably six or eight, had to lighten their loads and be pushed up.

An astute farmer's boy had provided a

1. Oiling up. 2. J. B. Becker Talks Elmore to an Observer. 3. Ben. Smith Studies his Book.

pair of horses to tow helpless cars up Leicester Hill. There was no call for his services, however, and as he moved away he was greeted with derisive remarks by the occupants of the toiling cars.

When Foster Hill, the bad one of Saturday, was reached it looked even steeper than at the time of climbing it. There can be little doubt that it was almost as difficult a hill as Nelson Hill, with an even steeper grade. Consequently the great number of cars ascending it speaks volumes for the improvement one year has made.

A few miles beyond Foster Hill the steepest grade of the run was met with. It was short, but with a grade that could not have been much less than 25 per cent. But it was possible to obtain a good start and rush almost all the way up. It was historical ground too, as was attested near Brookfield by a stone forming part of a fence and bearing this inscription:

"Here stood the fortified house besieged in King Philip's War."

None of the contestants, of course, paused to read it. All along the route the automobilists were given a hearty welcome. Crowds gathered in all the towns and villages and cheered to their hearts' content. Everywhere there was the best of goodwill, and cries to go faster were often heard. As before, horses were brought out to be broken to the sight and sound of the cars.

A short distance out of Worcester the warning was given to watch out for bicycle policemen who wished to arrest a few automobilists. A slower pace was maintained and the bluecoats were robbed of their prey. As one of them put it to the Motor World man:

"We don't't care if nothing greater than twelve miles an hour is ma le. But the people are complaining of too much speeding, and we have to do something in the matter."

To-night a theatre party at the Nelson is in progress, the visitors being the guests of the Stevens company, of Chicopee Falls. Following it will come a smoker at the Worthy House, tendered by the local club.

The total number to reach Springfield to-night was 69 cars.

Not very far east of Worcester this morning an odd sight was witnessed. A wagonload of wood was encountered, and right on top of the wood was seated a woman wearing a calico dress and a sealskin coat. A tonneau car went by the team, and a ribald young man in it greeted the lone female with, "Good morning, Carrie." She pursed her lips, looked straight ahead and said nothing, whereat the occupants of the car laughed loudly.

Near Wellesley this morning the car which contained Chairman Scarritt and W. J. Stewart narrowly escaped having a serious accident. The road was very slippery, and in making a turn the driver of the car lost control of it and the rear wheels started to skid. It swung completely around, and just escaped crashing into a telegraph pole.

"We came near to giving you newspaper men something to write about this morning," remarked the affable chairman to the Motor World man in the Massasoit to-night in relating the circumstances. "For a minute visions of the Fair accident came before me, and I was heartily glad when we came to a stop and found that no harm was done."

"You had better be careful how you go through Spencer," remarked a native of a little town west of Worcester, where the Motor World car stopped to take water.

"Why?" he was asked.

"Because they are laying for you people. A man went through there last week on the way to Worcester, and he raised hell. Went about 40 miles an hour through the town, slap dash, making everybody scatter. It was one of them big French machines, red, with a rather stout man driving it. They telephoned ahead to Worcester and tried to stop him there, but did not succeed. So they are going to arrest anybody that goes through fast."

Upon reaching Spencer, however, either because the pace was moderate or because the countryman had stretched the matter, no trouble was encountered.

To-night L. D. Fisk, of Hartford, related a story at the Tontine, which may or not be the sequel of the Spencer yarn.

"I went through to Boston last week, and in places 'hit it up' pretty lively," he said.

Digitized by Google

"Just after getting into Worcester and putting up at the garage a man came in and began to make some inquiries about an automobile that was wanted for speeding through Spencer. The authorities of the latter place had telephoned about it, and he was looking for the man. 'Did this machine,' he asked, pointing to mine, 'come that way?' 'Oh, no,' was the reply; 'it came from Boston.' So," concluded Fisk, "the ready reply of the man saved me, if it was really me they were looking for."

The hero of the theatre party to-night was Percy Owen, that mild mannered, innocent appearing gentleman who presides over the destinies of the Winton establishment in this city. When the "leading lady" started to sing that pathetic ballad, "In the Good Old Summer Time," Owen stepped from his box to the stage, gave his hand to Miss Lee and executed a cakewalk to the catchy tune amid the tumultous applause of his fellow voyagers.

It was Owen, also, who at the smoker, somewhere near the wee small hours, told for the hundredth time his famous story giving his version of the Prodigal Son. When he came to the end, where the loving father told his son that in honor of his return he would kill the fatted calf, which he had for just such an event been keeping for "years and years and years," he was cheered to the echo.

The speeches at the smoker were of a serio-comic character. W. J. Stewart acted as master of ceremonies, and did it well. E. E. Britton related a funny story of an Hebraic gentleman's experience with an automobile, and R. P. Scott told of the cars he had bought that did not work. Dr. Doolittle, of Toronto, told of his being in London in 1896, when an American car, the Duryea, won the Brighton race.

Chairman W. E. Scarritt passed into a more serious vein when he intimated that the 1904 run would be to St. Louis. He then went on to speak of the splendid showing made in the present run, and compared it to the recent British tests.

"Of the more than 80 cars starting in that contest," he said, "but two came through with a clear record. Then, two weeks later, the committee, with typical British justice, discovered that an American car, the White, had left a garage a minute late, and deposed it from its position, leaving a British car the only one to make a perfect score."

East of Leicester a Good Samaritan was encountered. He had a wagonload of apples, and he dispensed them with a generous hand to everybody that wanted them—and that was about everybody in the party. The Motor World men got a good supply, and thereafter for a number of miles every car they passed had at least one passenger munching apples.

F. A. La Roche had no end of trouble with his Darracq during the first half of the run. He asserted most positively that the engine had been tampered with by a discharged employe. He found a couple of steel balls in one of the cylinders, he stated to the Motor World man, and it was reported that he had also found a piece of waste choking up the outlet from the gasolene tank.

From Boston down, however, the car ran perfectly. La Roche expressed the hope at Worcester that his troubles were over, and such proved to be the case.

Although Dr. Carman did not get into Boston until 11 o'clock on Saturday night, in a heavy rainstorm, owing to a slight breakage on his Foster steamer, he was in fine spirits, and declared that he was enjoying himself immensely. He made the return journey in good shape.

SPRINGFIELD—NEW HAVEN

Approaching the end With Nearly all Cars in Good Shape—Two Contestants Quit—Dusty Roads Again Encountered.

New Haven, Oct. 14.—With a practically clean sheet to Hartford, and a rush of 60 cars in less than half an hour here this afternoon, it seemed as if to-day's short run would be the most successful of all.

But quite otherwise the case proved to be. Four cars met with mishaps, most of which seem certain to result in their withdrawal from the contest. Outside of these the day's happenings were few, and the splendid record made was yet further improved upon. Seventy cars started from Springfield, and as many loafed into Hartford. To-night two are missing, one is out of the contest and another will probably be compelled to withdraw also.

The unfortunates are a Foster steam car, No. 6, which broke a crank shaft just out of Hartford, after having, it is claimed, made a perfect record up to that time. It was thereupon withdrawn from the contest. About eight miles from New Haven a De Dion, No. 71, broke a piston and was ignominiously towed into the control by L. D. Fisk's Panhard. The Locomobile gasolene car, No. 29, got into trouble immediately after leaving the Hartford control, and was stopped for repairs. A bolt, or bolts, in the differential gear is given as the injured part, and it was thought that it would be able to start on in a few hours. The fourth car, which is still missing, was No. 15, a Ward-Leonard. The Motor World car passed it six or eight miles out of New Haven with its driver at work on the engine. Just what was wrong is not known.

Outside of these casualties the day's crop of stoppages is a meagre one.

At Hartford C. E. Proctor's Winton, No. 59, reported a two minute stop, due to a trembler needing adjustment. A Locomobile, No. 35, caught fire and scorched the body. Its observer pleaded guilty to one stop to relight his burner. Just before reaching Hartford the Franklin contestant, No. 45, had trouble with a dirty sparking plug, which caused a stop of two minutes.

In the afternoon No. 19, the Automotor, had three stops, due to battery troubles, a broken wire and a leaky water tank. Stop for water, penalized, was made by No. 56, a Long Distance car. These, with the more serious accidents reported previously, make up the day's list, except that something happened again to No. 45. What it was its operator and observer both refused to state, in spite of persistent inquiry on the part of the Motor World man.

The morning dawned a bit hazy, but the sun soon broke through the clouds and an ideal day was promised. The members of the party were in high spirits, and a start could have been made at 8 o'clock, as was done yesterday, had it been deemed advisable.

But the day's run was a short one, over excellent roads, and the only change made was to lengthen the noon stop by nearly an hour. This was done in order to give more time for the banquet at the Allyn House tendered by the Hartford Rubber Works Co. An early finish was possible in spite of this, as the first cars reached New Haven before 4 o'clock, although the afternoon's run was the longer of the two.

For a number of miles after leaving Springfield, 70 cars being sent off in 11 minutes, the road was bad, being soft and rutty from the rain of Saturday night and Sunday.

The cars were obliged to proceed in single file and at a slow pace. To add to the unpleasantness, the township authorities at one point had been making what they were pleased to term repairs. They consisted in dumping soft dirt in the centre of a road already worn down at the sides. Into this the passing cars cut deeply and the going was very heavy.

When about half the distance to Hartford had been covered the roads became dryer and better generally. Consequently it became necessary to go slowly in order to kill time.

Something had evidently "dropped" in the police department, for arrangements had been made to regulate the traffic at and around the Allyn House, the noon control.

The officious Sergeant Creedon was there, but he was subdued by the presence of his captain. The latter took charge of matters, and kept the confined space as clear as could be done without utterly blocking the traffic. Consequently there was nothing to complain of.

After enjoying the hospitality of the Hartford Rubber Works Co. at luncheon a start was made promptly at 1 o'clock, a large crowd of people witnessing it.

Upon emerging from the city it was seen that the excellent roads entered upon were quite dry. As the cars were closely bunched clouds of dust arose, although the roads themselves were in just the proper condition, neither too wet nor too dry. Consequently goggles were once more brought forth and donned.

A departure from the usual plan was being made it was soon seen. Instead of "hitting up" the pace from the start, and loafing at the finish, as on other days, a steady, even pace was cut out. It seemed to be recognized that as the roads were almost uniformly good, there was no necessity for haste in order to allow for a slower pace over bad roads at the finish, as had been the practice.

It is true that the famous Wallingford sand region presented some obstacles to the easy progress of the cars. The latter cut in deeply and labored somewhat. But the stretch was not long, and, being over, the going became better than ever.

This afternoon's run has been marked by large and enthusiastic greetings from the towns and villages passed through. Meriden was particularly noticeable in this respect, the progress of the cars through it being one continued ovation. School children were out in a dozen places, recesses having apparently been declared at each institution of learning as the cars went by.

When No. 16 car came to a stop in front of the Allyn House the observer was asked the stereotyped question, "Any penalized stops?" No reply was made, and the question was repeated, but with like result. Then the driver was tried, and he, after hesitating a moment, was frank enough to say that he had been warned not to give any information. Asked who told him this, he said it was a man with a red cap—the badge of the timers and checkers. Then he moved off.

A little later the Motor World man encountered Chairman Scarritt and related the circumstances, and asked if any such instructions had been given. He replied that nothing of the kind had been done, to his knowledge.

At this moment the driver of No. 16 passed. He was stopped, and Chairman Scarritt told him that the question of the newspaper men was entirely legitimate, and, while no one was compelled to give the information desired, it was entirely proper to do so. Thereupon the driver very civilly stated that he had had two trifling stops during the morning.

Digitized by Google

Desiring to extend hospitality of some sort to the visitors while at Hartford, the Hartford Rubber Works Co. made arrangements to entertain them at luncheon both going and returning, on Friday and Tuesday, respectively. They did so, the contestants being met at the Allyn House by the officers of the company, consisting of Lewis D. Parker, president; F. H. Turner, vice-president; W. H. St. John, secretary, and Burton Parker, Frank Day and W. H. Kirkpatrick, of the travelling staff.

After an enjoyable hour and a half in Hartford, and just previous to the departure of the vehicles, President Shattuck, of the Automobile Club of America, on behalf of the contestants and their friends, extended the thanks of the organization to President Parker for the many courtesies received.

Although his car came to grief early in the run, Knight Kneftel could not stay away from the party. He met it at New Haven on Tuesday night and accompanied it to New York.

NEW HAVEN—NEW YORK

Sixty-eight Cars Cover Last Stage—Committee Effectually Stop Scorching —Big Crowd at the Finish.

New York, Oct. 15.

Another bright, sunshiny day, with just a trace of keenness in it, had been reserved for the last stage of the run. Enjoyable as the latter had been, everybody was glad that it was approaching a conclusion and that New York was so near.

Evidently there had been a fire sale of megaphones somewhere in New Haven, for a considerable number of the party had equipped themselves with these useful implefive minutes before the start some one started to blow a horn, and in an instant the air was filled with the strident sound of other horns. The noise was added to by ments and were prepared to use them. About the megaphone shouters, and it was to a concert of this sort that the start was made.

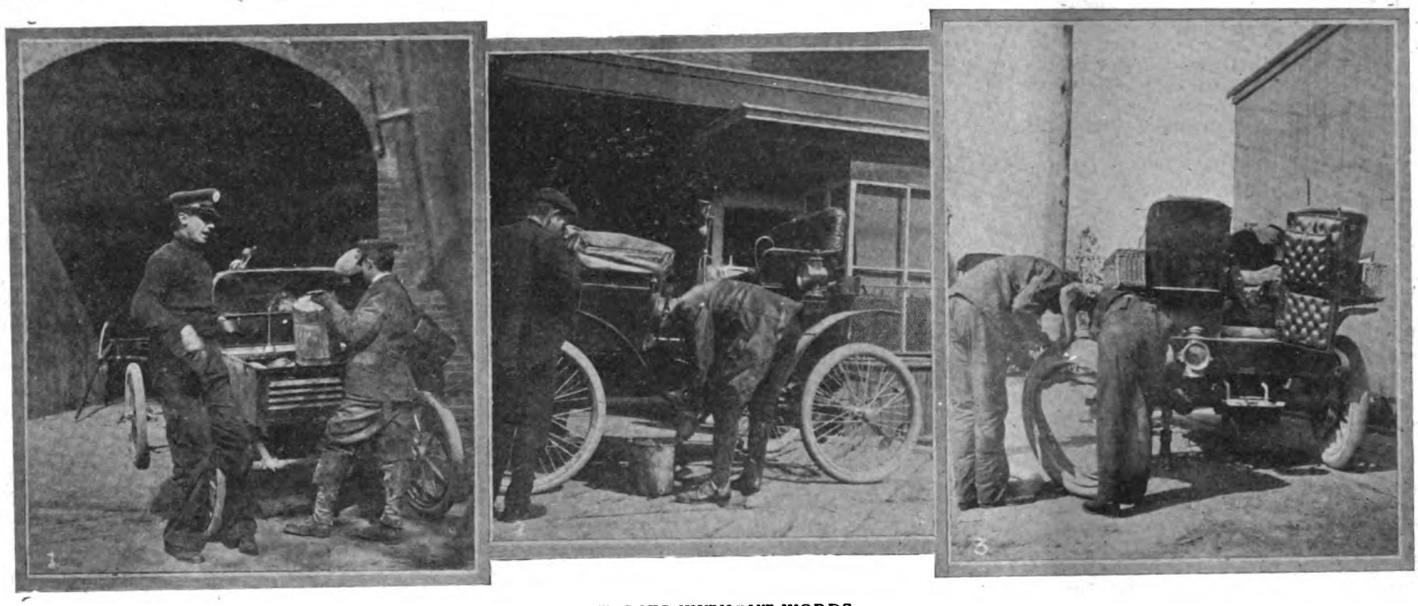
A remarkable piece of work had been performed by the operator of No. 71; the De Dion which broke a piston and was towed in the night before. Word had been telephoned to Boston, and by 11 o'clock a man had reached New Haven with a new piston. It was put in place of the broken one, the car gone over, and bright and early this morning it was in line, right up at the head and ready to start first. The Ward-Leonard, however, which proved to have had trouble with its clutch outside of New Haven, did not put in an appearance.

Consequently only 68 cars faced the starter this morning, and the entire number is in New York to-night. To be sure, some of them made rather inglorious finishes. For example, No. 36, a Locomobile, was pushed in by an outside car from Seventy-fourth street, owing, it was claimed, to getting out of water. The Italian car, No. 49, was stopped just a few blocks from the finish by an overheated engine and had to be towed in. Pushing had to be resorted to in the case of an Elmore, No. 38. It was curious that all these mishaps should occur with the finishing point in sight and the long journey almost over.

It was a day marked by a number of minor troubles also. The run was not a particularly trying one, but a number of otherwise clean scores were marred.

A good crowd turned out at New Haven to witness the departure, and had not the police arrangements been well looked after there would have been trouble in getting clear of the town. At Bridgeport the crowd seemed to be even larger than on the outward journey. For a considerable distance policemen were stationed at every block, directing the cars and keeping the people in check. The Automobile Club of Bridgeport was equally attentive, and did much to facilitate the passage through the town.

At several places along the route, particularly as New York was approached, the arrows had been removed, and it was strange that wrong turns were not taken.



At Norwalk a welcoming delegation had gathered. A. C. Bostwick had driven up in a Pan-American car, which attracted a great deal of attention. George F. Chamberlin, of the contest committee, was also present to greet his colleagues. Harry Fosdick passed through Norwalk en route to New York just before the last stage was entered upon. He had left Boston at 1 o'clock in the morning, and reached New York's outskirts at a few minutes past 4.

The previous night at New Haven the contest committee had met and taken precautions to prevent speeding the next day. It was announced that two pace making cars had been arranged for, and that any car passing the pacemaker would be instantly disqualified. Attention was further called to the resolution passed by the American Automobile Association in May last, providing for the punishment of any one who indulged in speeding in a contest of the sort.

There had been all sorts of rumors afloat about the struggle for first place that was to take place. A dozen or more cars were said to be in readiness to push forward regardless of everything. But the committee's action squelched such plans, if they were really made, and the ride from Norwalk was in a dignified, orderly procession, especially the latter part of it.

A crowd numbering several thousand people had gathered in Fifth avenue, and the cars as they came in were compelled to pass between a living wall.

As they reached the control their time was taken, the books signed and collected and the cars sent around into Fifty-seventh street in a hurry.

STORIES WITHOUT WORDS.

Complaints About Gasolene.

There was, as usual, some complaint of the quality of the gasolene. Whenever an engine or burner got to acting badly, and no other cause could be assigned for it, it was put down to bad gasolene.

As a matter of fact, the Standard Oil Co. looked after this matter very well. There was some complaint that 18 cents a gallon should be charged, but that was the uniform rate all along the route. It appears, too, that this was a special rate, for at Boston the salesman informed the Motor World man that the price was 20 cents to those not in the run.

The Ladies on the Run.

Just five ladies participated in the run. At Hartford a local automobilist, W. C. Russell, in a Stanley surrey, joined the cars, accompanied by his daughter, Miss Russell, and her friend, Miss Corbin. On Thursday Mrs. Riker joined her husband, A. L. Riker, and rode with him throughout the remainder of the trip. This makes five ladies in the party, the others being Mrs. I. W. England, of Passaic, N. J., and her friend, they riding in Mr. England's new Puegeot car.

The ladies all seemed to enter keenly into the spirit of the affair.

WITH THE FREE LANCES

The men who Accompanied the Reliability Run Without Thought of Rules—Business for Some; Pleasure for Others.

Among the cars that accompanied the party as far as Boston were those of President Shattuck of the A. C. A., and Harry G. Woodworth, of Rochester, N. Y. The former had J. Dunbar Wright and Robert Graves as his guests. Woodworth was accompanied by Frank G. Webb, of the Long Island Automobile Club, who went along at short notice.

"Woodworth persuaded me to start with him and go as far as New Haven," he said to the Motor World man. "I enjoyed myself so much that when I got there I decided to got a little further if everything was all right at the office. Calling it up on the 'phone I found that I could be away Friday, and at Springfield I repeated this and so came on to Boston. But I must go down to-night by train."

On Sunday afternoon about 4 o'clock, when it was still raining a little, Woodworth started to drove down to Providence in order to take the night boat from them to New-York.

A large number of the trade and press interested in the reliability run from New York to Boston and return covered the route by train, meeting the contestants at the noon and night controls. Among the number were W. H. Kirkpatrick, of the Hartford Rubber Works Co.; George H. Lowe, of the White Sewing Machine Co., Boston; James Becker, of the Elmore Mfg. Co., Clyde, O.; H. A. Githens, of the G. & J. Tire Co., Indianapolis, Ind.; W. D. Gash, of the Fournier-Searchmont Automobile Co., Philadelphia, Pa.; Clarence E. Whitney, of the Whitney Mfg. Co., Hartford, Conn.; Harry T. Dunn, of Fisk Rubber Co., Chicopee Falls, Mass.; Wetmore Worthley, of the "New York Evening Telegram"; A. G. Batchelder, "New York Journal"; Al. Reeves, "New York Mail and Express"; J. C. Kerrison, of the "Boston Herald," and a number of representatives of the trade press.

A most enjoyable trip was reported by I. W. England, of Passaic. With the ladies in his party, he remained in Boston until 3 o'clock in the afternoon "doing" the city, and made a fast run to Springfield. He took supper at Worcester, and reached Springfield at 11 o'clock, only to find that the rooms he had engaged at the Cooley House had been let go just a few minutes before, the clerk thinking that he would not get there.

"We have had the finest time imaginable," he said to the Motor World representative. "Starting as a free lance, as we did, we have been able to do as we pleased, and yet everybody has been very kind to us along the route. Had I been entered my run would have been a clean one, for I have not made a stop between controls nor made any repairs beyond replacing a defective sparking plug."

The European tourists, Harry D. Corey and Harry A. Fosdick, the latter the Winton Co.'s manager at the latter place, expected to accompany the party to Boston. But red tape at the custom house made it impossible to get the car out in time, so Mr. Corey went to Boston by rail, while Fosdick waited for the car. He got it on Thursday afternoon, shipped it to New Haven on the boat, and to-day brought a party of newspaper men with him to Springfield.

One of the familiar figures along the road was "Wally" Owen and his Gasmobile. There were many wagers that the twain, with their load of newspaper men, would eventually come to grief during some of their wild dashes, but such predictions turned out to be erroneous. New York was reached with then still intact, and the tauchness of the Marion product was again demonstrated.

Dr. Hovestadt, of Brooklyn, met with hard luck. He went into a sand hole between Worcester and Boston and broke both steering knuckles and had to give up. He met the party on its return to New York.

Although the Pope-Robinson car was scratched, it made the run from New York to Boston, accompanying the party for the greater part of the distance.

Grenville Russell Dead.

F. Grenville Russell, general sales manager of the Automobile Co. of America, Marion, N. J., died at the Post-Graduate Hospital, in New York, on last Wednesday. He was taken to the hospital the week previous, suffering from appendicitis, and successfully underwent an operation, but on last Wednesday a second operation was found necessary, from which he failed to recover.

Mr. Russell had a very large acquaintance in the bicycle and automobile trade, being at one time connected with the sales department of the Pope Mfg. Co., and for five years with the Electric Vehicle Co., of Hartford. For the last eighteen months he had been manager of the sales department of the Automobile Co. of America, and was highly esteemed by the officers of that company. He was to have filled an important position with the new company which is being organized. His death is exceedingly regretted by a large circle of friends. The funeral took place from his home at Hartford, Conn., last Saturday afternoon, and was very largely attended.

The best way for one manufacturer to get ahead of another is for him to advertise oftener and better—and to pay better attention to his business. The whole secret of trade success is encompassed in this bit of advice.

TIRES THAT TROUBLED

But why no one Seems to be able to Say—Punctures are Most Frequent in the Reliability Contest.

Just why there should have been so much trouble with tires on the run is one of those things which no man can find out. A number of theories were advanced bearing on the matter, but proof could not be brought to support them conclusively.

Punctures were the prolific cause of the stops referred to One of the White carriages, for example, replaced five inner tubes during the run. The driver did not think they were punctures, but what they were he could not say. Others again found nails and even screws sticking in their tires. At Boston several of these were picked up in the yard of the garage.

One theory was that the tires heated while running and the inner tube joints were opened in consequence. The Motor World man instituted inquiries regarding this, and found one case where this happened. But no others could be learned of.

But little replacing, outside of inner tubes, was done. Of course, if a puncture or cut occurred the injured tube or tire was replaced at once. Representatives of the tire companies accompanied the party, going from control to control, and looked after the troubles referred to. Some days there would be little or nothing to do; at others casualties came thick and fast.

Many quick roadside repairs were made. New inner tubes were put in in less than half an hour, and in spite of the size of the tires no great amount of difficulty was encountered in doing this work. Lifting jacks were in great demand.

Of the troubles which were so prevalent last year there was scarcely a trace. The fabric did not part from the rubber nor the treads loosen, nor did tires tear off the rims. In short, faults of construction were conspicuous by their absence, if the punctures be consigned to a different category.

English Eyes on Ireland.

Unwilling to relinquish the desire to run the 1903 Bennett Cup race in the United Kingdom, British automobilists are still turning to Ireland as the only possible country in which it could take place.

One the one side is the fact that there is no legal speed limit in the land of the shamrock, while against this may be put the lack of the kind of roads desired. So far the Automobile Club has not reached any decision on the subject, though in letters in its possession, written by gentlemen holding important official positions, it is stated that special efforts will be made in certain districts to improve the road surfaces should the committee in charge of the race arrangements decide to contest for the cup in Ireland.

AGAIN THE

HAYNES-APPERSON

MAKES A

PERFECT RECORD

In the New York-Boston-New York Run, and Qualifies for the

PRESIDENT'S CUP.

The nine-horse power HAYNES-APPERSONS last year in the New York-Buffalo run beat ALL MAKES, American and foreign, many of double their horse power; winning HIGHEST HONORS of ALL. This is the reason:— the HAYNES-APPERSON is the ONLY AUTOMOBILE that has been consistently developed through 10 years of successful experience on American roads. The same development that has given foreign cars their reputation has given the HAYNES-APPERSON its proved reliability, but because of the more severe conditions in this country there is no car of equal horse-power that will last as long, handle as easily and ride as smoothly on American Highways as this American product.

Commentary

Now is the time when the really wise man makes up his mind just what kind of a vehicle he wants and places his order for it with the manufacturer of his choice. Unfortunately, wise men are no more plentiful among automobile purchasers than elsewhere, and so the average man puts off ordering a vehicle until the arrival of some nice warm day in the early spring tempts him to the road. The next day the tempted one strolls in to the agency of his chosen vehicle and tells the smiling salesman that he wants such and such a kind of automobile then and there. What the salesman tells him matters not, save that it is more in the promising line than it is in the providing one, and forthwith there is woe and lamentation in the house of the would-be buyer. Until the world is made over, however, the procrastinators will continue to be in a large majority, and the automobile maker will not be alone in his regret that the day of making over seems yet far off.

* * *

"Old Moore," who in Europe enjoys an extremely profitable reputation as a reader of the stars, has issued his annual proclamation telling the world what it is to expect during the year 1903. Two months are named as being of extreme promise to those who are interested in the art and science of locomotion. According to "Moore," "aerial automobiles will be the surprise of the world in March," while "road locomotion will make vast strides in May." Thus the three M's, Moore, March and May, may play very important parts in automobiling, if "Old Moore" has not read the stories of the stars incorrectly.

* * *

It takes a lawyer to show just how many twists can be given to the English language. Recently a New York lawyer was arrested down on Long Island and haled before a Patchogue justice, and there charged with the high crime and misdemeanor of propelling an automobile over the public highway at a speed faster than the local constable thought was legal. At first the accused attempted to convince the judge that he was not proceeding faster than the eight miles an hour allowed by the law. The constable put in the usual forty miles an hour per Waterbury timing allegement, whereupon the lawyer asserted that even if he was going at that speed at the moment of his arrest he still could not be held under the law. He claimed that the law permitted him to make eight miles within an hour, thus allowing him to proceed at any speed he pleased, provided at the end of an hour's travel he had not driven the vehicle more than eight miles. The Patchogue judge seemingly had a different idea, since he fined the automobilist $20, and told him if he thought the Patchogue interpretation of the law was wrong he had the higher courts to appeal to. I imagine there won't be any appeal, though, on any such grounds as these.

* * *

Alderman Lumpkin, whose name and office are certain indications of his intelligence and his intolerance, in a recent speech before his colleagues declared himself to be "in favor of declaring automobiles a public nuisance and refusing them the privilege of the streets of Kansas City. Upon some of the poor, misguided citizens whose misfortune it is not only to be governed by gentlemen of the Lumpkin stripe, but also to own automobiles, attempting to defend themselves and their possessions against Lumpkin law and logic, the learned legislator replying to their offer to devote a certain portion of their time each day to breaking horses to the sight and sound of an automobile, promptly said:

"What tommy-rot that invitation of you automobile owners is of inviting owners of valuable horses and conveyances to meet you with their horses and vehicles on one of the boulevards to become used to the automobile. Why that is a direct invitation to a man to come out and imperil his life and his horse. If it was left to me I would not allow automobiles on the boulevards at all."

Of course, with the honorable Mr. Lumpkin possessed of such ideas and prompt to express them, there was nothing left for the humble citizens but to lowly bow and silently withdraw crushed to the dust by the hauteur and the homage of Alderman Lumpkin, be gosh!

* * *

It has come at last. I just knew it would. The automobile is now the wrecker of family happiness. According to the story which I find repeated in many veracious papers, the wife of a Chicago physician who is both wealthy and a vocalist, has taken her woes to the divorce court. Sad it is to relate that neither her musical charms nor the soothing influences of her money prevented a brass trimmed, red automobile from becoming her rival. "He neglected me," sighs the deserted wife, as she relates in her bill of particulars how her husband rode away from her side and left her all forlorn, to weep tears of loneliness while he chug-chugged over many miles of dusty roads. Every one who reads the papers has long since been taught by the editors thereof that the automobile is the Juggernaut brought up to date, although, in its case, its hundreds of alleged victims do not make willing sacrifices of themselves. Any and all of the editors will tell you, in fact, they have repeatedly told you, that the automobile is synonymous for all that is reckless and uncontrollable, that is nerve racking, law defying and the one thing in all creation which is without a single redeeming feature.

Now that the vehicle appears in the role of the destroyer of family bliss, the catalogue of its crimes is complete. Nor can it be argued that it is blameless, being mechanical and irresponsible. It is a witch, a Frankenstein on four wheels. Any editor of a cross roads paper who never saw an automobile will tell you as much and more.

* * *

Among the many things which are beyond my comprehension is the case of the ancient individual who had no difficulty whatever in swallowing a camel, but, try as he would, absolutely could not encompass a gnat without the most heart rending straining. For some, and I suppose excellent, reason, neither the name nor the profession of this unfortunate swallower has ever been made public, but I am inclined to believe that some way or another he must have been connected either with a dime museum or a side show—institutions which show a great interest in those whose physical make-ups in any way border on the abnormal. If the late lamented camel-gnat swallower left any lineal descendants I know where they are right at this moment. They are all members of the London Local Government Board, which has been investigating the terrible damages done to British highways by the rubber tired motor vehicle. Oh, Lord!

* * *

One of those Western geniuses whose inventions occupy a more prominent position in the Patent Gazette than they ever do anywhere else, has invented a sail which he says can be attached to an automobile in such a manner as to allow of the vehicle running before the wind at the rate of fifteen miles an hour without employing an ounce of power other than that afforded by the sail. I can see a great future for that sail—if. All that is now needed is an invention which will make the wind occasionally blow in the direction which a person wants to go. It never does, you know!

* * *

When Stephenson desired to introduce the steam engine in England the Crown of England, through its astute and learned representatives, warned the people in a public edict "That inasmuch as certain persons have seen fit to impose upon our people strange and extraordinary proposals to engage in a business, on a let line of iron rails, so managed as to carry passengers and freight from point of departure to destination with safety, at a rate of twelve miles an hour, all things consigned to them, we think that cannot be done, and warn our countrymen against the insidious advances of plausible argumenters who will endeavor to beguile them into subscribing for shares in said company." The descendants of the author of this proclamation emigrated to America, where they increased and multiplied, until to-day there are enough of them to supply at least one member to every town council in the country, where he promptly introduces a fool ordinance aimed at the automobile.

It requires confidence to start but **ONE** car in an open contest.

THERE WAS BUT

ONE PRESCOTT

IN THE

RELIABILITY RUN

AND IT

FINISHED WITH A PERFECT SCORE.

FOR FOUR PASSENGERS—FRONT OPEN.

Of course, we knew the PRESCOTT—knew what it has done and can do. We knew it so well that we could afford to risk its reputation with one car. Others dare not take such chances.

The PRESCOTT in the run was a regular stock car. It went through without hitch, skip or stop. Not a nut or bolt started. Not a tire punctured—they were Fisk tires.

The same steam car won certificates in Long Island and Automobile Club of America Endurance Runs. Has been driven over 6,000 miles this season—on one tour of New England it covered 2023 miles in sixteen days.

ALL PRESCOTTS ARE AS GOOD AS THE ONE USED IN THE RUN.

PRESCOTT AUTOMOBILE MFG. COMPANY, - 83 Chambers Street, New York City.

THE FOSTER A WINNER.

Will your purchase of an automobile be influenced by the "hot air" of the maker or by the results of practical and conclusive tests?

No buyer can afford to disregard the following facts:

In the great Reliability Run from New York to Boston and return held during the second week in October, the Foster Automobile made a record which in some respects was superior to that of any other machine.

The Foster finished in the leading bunch and was one of the twenty vehicles that made a clean score for the entire run.

The machine used was the same one that had previously made a successful run from Buffalo to New York City.

Of the vehicles which started, 55 were gasolene and 19 steam. Yet of those that finished with clean scores, 10 were steam and 10 gasolene; 45 gasolene machines went wrong to only 9 steam machines.

This record conclusively demonstrates the superiority of steam power and the desirability of the Foster carriage.

Catalogue on request.

L. A. W. ASSININITY

Circulating Petitions Favoring an Illegal Law—One Official's Odd Admissions.

The New York Division of the League of American Wheelmen, or, more correctly, certain officials thereof, have "broke loose" again. Their re-election is being strenuously opposed, and their sudden and pernicious activity may be attributed to one of two causes: a desire to create campaign thunder or to personal and official ignorance.

The officials' latest outbreak takes the form of petitions and circular letters urging the enactment of the ordinance proposed by themselves and which seeks to have automobilists of this city examined and licensed and hedged in generally. The fact that the Doughty bill expressly forbids local ordinances of the sort has no effect on the brilliant individuals who are behind the movement. They maintain that the aldermen "have an undoubted right to enact it." That a few automobilists have favored a system of State license is unction to their souls, for, after remarking the "daily list of appalling accidents" and telling wheelmen how very much they are afraid of motor vehicles, the circular letter remarks the fact but is fearful that the automobilists, "who are well supplied with money," may, "if they defeat the local ordinance, change front at Albany and oppose any measure that may be introduced there"—a gentle intimation that the aldermen are bribe-takers and that the automobilists may resort to bribery.

The letter bears the signature of John F. Clark, secretary-treasurer. Mr. Clark, however, is firing balls that are prepared by others, who are merely "using" him for their own ends. He is a kindly, white haired old gentleman, who does not appear capable of the bombastic exaggeration and vindictive folly which he is made to shoulder. When a Motor World man interviewed him on the subject he first attempted evasive replies, and finally admitted that he had nothing to do with the matter. His name was used because it was convenient.

Asked if he had heard of the Doughty law, Mr. Clark admitted that he "had heard something about it." When its exact language was quoted and he was asked how he reconciled it with his statement that the aldermen have the undoubted right to pass a licensing ordinance, Mr. Clark laughed uneasily and replied:

"I don't attempt to reconcile anything."

Asked if he had any facts or figures to prove an appalling list of accidents, he responded in the negative. When the Motor World's statistics were quoted he was genuinely surprised and proceeded to tell a story of a bicycle accident in which he had come out on top. Asked if the bicycle was not once the red devil and mankiller of the sensational press, he admitted it frankly, and when the pressure became too strong he finally said:

"Well, I don't know much about any of the laws and I did not compose that letter. I merely signed it when it was brought to me. If you want to know any more about it you'll have to see the men that wrote it."

Automobile With Rapid Fire Gun.

Major P. R. Davidson, of the Indiana State Militia, and two cadets of the Northwestern Military Academy are on their way from Indianapolis to Washington in an automobile with a rapid-fire gun mounted on the front end. Major Davidson devised the machine, which was built at the academy. It weighs 2,600 pounds, is 12-horse power, and the motive power is steam. It is geared to run from 35 to 38 miles an hour.

Major Davidson is reported in an interview as saying: "I think that it would be a good thing for mobs or disturbances in cities where there are paved streets, but it can never take the place of field artillery with horses. Turn any sort of an automobile loose in a street, and a mob would break quicker than they would for horses, and another advantage of the machine is that it can be fired with equal facility while advancing or retreating."

Eddy Penetrates Canada.

That veteran tourist, Arthur J. Eddy, ex-president of the Chicago Automobile Club, has just completed a 1,000 mile trip through Lower Canada, on which he was accompanied by Mrs. Eddy. They penetrated many portions of French Canada far removed from the usual routes of travel, where the inhabitants were in almost total ignorance of the existence of such a vehicle as an automobile.

Including various detours, the distance covered in the journey was something more than 1,000 miles, and, in spite of wretched roads, steep hills and deep morasses, not a breakdown occurred serious enough materially to delay the trip.

Corey Covers 1800 Miles in Europe.

H. D. Corey and Harry A. Fosdick, of Boston, Mass., the latter manager of the Winton branch in that city, arrived in New York from a European trip last Wednesday. While in Europe they travelled over 1,800 miles in their Winton touring car, and all the troubles they experienced were two tire punctures. It was the intention of Messrs. Corey and Fosdick to go to Boston with the reliability run, starting on Thursday morning, but owing to the red tape existing in the New York Custom House they were unable to secure their machines until Friday, when Mr. Fosdick joined the run at New Haven.

QUEER QUAKERS

They Draft an Ordinance Placing Themselves in the Hands of Their Enemies.

If, henceforth, Philadelphia people take stock in the sensational stories regarding the heniousness of the automobile they will have some ground for it. Thanks to a committee of the Automobile Club of Philadelphia, substantial color was last week given that too-popular notion. They performed the doubtful service at the joint conference held with a view of drafting an ordinance satisfactory to all vehicular interests and for submission to the City Council.

Henry G. Morris and Captain John S. Muckle represented the Automobile Club and C. T. Harrop and J. Frederick Hartman the Century Wheelmen. Invitations had also been sent to the Pennsylvania Railroad, the Philadelphia and Reading Railway and the Philadelphia Rapid Transit Company to send representatives, but none was present from these companies.

The ordinance was presented by Captain Muckle. It fixes the maximum speed for vehicles at ten miles an hour within the city limits. In the matter of penalties for violation of regulations the fine for automobiles is made $25 for the first offence and revocation of license for the second. Violators in other vehicles were, however, considered of small moment, and may break the law an indefinite number of times at the relatively small cost of $5 for the first offence, $10 for the second and $25 for the third.

Talking of a Private Road.

Another private automobile road on Long Island is talked of. A number of prominent and wealthy summer residents talk of building a private automobile road from Smithtown to Ronkonkoma. This would connect the north shore with the central section of Long Island, and if the proposed road from Oakdale to Ronkonkoma is constructed it would make cross island travelling for those machines an easy matter. The report is secure a strip of land sixty feet wide, and that the road will be so protected that high speed will be possible for the entire length.

Marconi at Work on a Car.

Not content with equipping an automobile with his wireless telegraph apparatus, Marconi is at work on a car of his own design. Advices from Rome are to this effect. The vehicle will, it is stated, have a speed of 58 miles an hour.

The motive power comes from four dry batteries arranged in the form of a circle, and divided into four sections. A crank sets the batteries into action simultaneously. The batteries and accumulators guarantee a run of 560 miles.

GROUT BROS., Orange, Mass.

THE FRENCH HORNS ARE THE FINEST IN THE WORLD.

No. 8 Horn.

We are importing the largest assortment and most complete line of **FRENCH HORNS** coming to this country. **No. 8** is the most popular style, with opening pointing at right angle from the bulb.

We have in stock the following sizes, in addition to list given in our Catalog.

LIST PRICES.

Number.	Total Length.	Diam. of Bell.	Metal.	Price.
8	8½	3¼	Nickel	$4.00
9	10	3½	"	4.80
10	11	4	"	5.20
11	12	5	"	6.50
13	12	5½	"	7.50

The following are straight style, the opening pointing forward from bulb.

Number.	Total Length.	Diam. of Bell.	Metal.	Price.
12	13	5	Brass	$6.40
14	14	5½	"	7.60
1	8	2¾	Nickel	2.75
1½	9	3⅛	"	3.00
2	10	3½	"	3.40
2½	10½	3⅞	"	3.75
3	11½	4½	"	4.40
4	12¼	5⅛	"	5.60
5	13½	5¾	"	7.00

Any of the above Horns, fitted with 4 feet Flexible Metallic Tubing, $4.00 extra. No. 4, 12¼ total length, 5⅛ diameter of bell, with 3¼ feet Flexible Metallic Tubing and Screen attached, $12.50. **Brass or Nickel.**

Any of the above Horns delivered to any part of the United States, charges prepaid, 25 cents extra.

Discount to the Trade. *Catalog on Request.*

TWO RUNAWAYS

In New Jersey the Automobilist is Sued; in Connecticut the Township—Points Involved.

In the case of Joseph M. Hughes against Felix Warburg, reported last week in the Motor World, in which the plaintiff was awarded damages in the amount of $12,070 in the United States Circuit Court at Trenton, N. J., September 7, there is naturally so great an interest that the following charge to the jury by Judge Andrew Kirkpatrick is worthy attention:

"This action is one of law to recover damages for negligence, which negligence was approximately the cause of the damage sustained. There must be a connection of the negligent act and the cause of the negligence. It is not negligent to run an automobile on the public highways. The highways are for the common use for every one, whether a carriage, horse, automobile, wagon or what not. Each must use it with care. One may not want to wantonly commit a careless act on the highway; he would not use firearms for fear of hitting someone. The amount of care should be reasonable. He should use whatever care he can. If he should neglect to use it then he must answer. If the defendant's man used it the jury should deliberate on the testimony to that effect.

"The testimony shows that the plaintiff's horses were standing still when the defendant's machine, operated by his servant, came into Ocean avenue, 335 feet from the horses. There is a dispute as to the speed of the automobile. Some say that it was going fast and others say that it was slowing down whn in sight of the horses. This will be determined by the members of the jury.

"In the testimony of the chauffeur he says that he was slowing down and going to stop at a bicycle repair shop some eighty feet farther down the road from where Mr. Hughes and his horses were standing. Mr. Sparrow says that they noticed the frightened condition of the horses and signalled Mr. Martin, the chauffeur, to stop his machine.

"It is the duty of an operator of a machine to operate it so as to not cause fright in ordinary gentle horses, and so operate it that other horses will not receive injury.

"It was Martin's duty to look out on the highway. If you believe that warnings were given and Martin ought to have seen them it is your duty to determine negligence. If in your idea Chauffeur Martin used proper care then your verdict should be for the defendant.

"The defendant claims that the accident was not caused by Martin and the automobile, but the accident was due to a defective strap on the pole. On the part of the defence four witnesses have testified to the neck yoke and say that it was bad, while on the other hand Gordon B. Hughes testified that the strain was put upon it by the horses running away.

"If the testimony shows a want of care exercised by Chauffeur Martin and his failure to avoid the accident, then the verdict should be given to the plaintiff.

"The next question is the amount of damages the plaintiff can claim. Several elements enter into the case, and are: The amount actually expended for medical services rendered at the time of the accident, to the horses and to himself, and since.

"The plaintiff is entitled to damages, if any, to the loss sustained by reason of the accident, that is to say, the horse whose hind leg was broken and had to be shot, making a total loss. He is entitled to recover the market value of the horse, not at what he values the horse.

"He is also entitled to damages sustained to the harness, alto to the remaining horse, and its value after the runaway, and the difference in value as one of a team.

"The earning power of the plaintiff should be considered—if he is incapacitated from doing business he is accustomed to. The loss of earning power is determined in various ways. It is determined the same as when a man who is accustomed to do laboring work loses his right arm and is entitled to compensation.

"You must consider the earning power since the accident and the earning power in the future for the work he has been accustomed to doing. He is not entitled to any capitalized sum of money, but he is entitled to such compensation as is in your best judgment compensatory for the loss of earning power, of which I have spoken.

"The plaintiff is entitled to damages, if any, for mental and physical pain caused by the injury. There was no standard of value of damages for physical pain and suffering in the future. The amount in your judgment should be such as the evidence warrants."

On the other hand, as a part of the suits and counter suits anent the automobile, the following suit, to be argued in the Supreme Court of Connecticut, will be closely watched, as it brings into the subject the liabilities of towns for contributory negligence in the matter of runaways alleged to be caused by automobiles.

The case in point is that of Charles H. Upton, administrator of the estate of Mary B. Upton, against the town of Windham. Mrs. Upton was driving with her husband along a highway in the town of Windham. Their horse took fright at an automobile and ran away. The horse went down an embankment and Mrs. Upton was thrown from the carriage and killed, after the horse had run some distance from the roadway.

Suit was brought against the town, and Judge Gager, before whom the case was tried in New Haven, gave judgment against the town for $1,500. The lawyers on the part of the defendant asked Judge Gager to find that the defect in the highway, through the lack of a railing, was not the proximate cause of the injury to Mrs. Upton. Judge Gager refused so to find and he refused to find as otherwise requested. The lawyers for the town appealed from Judge Gager's decision. They claim errors as follows:

1. That as against the said deceased, Mrs. Upton, under the fact found, the town was not liable for not placing a railing upon the side of the highway at the place where the horse left it.

2. That the town, by law, was not bound to erect a railing to prevent runaway horses from going off the highway.

3. That the town was not bound to anticipate and guard against such an occurrence as is stated in the finding.

4. That, even if the highway, at the place where the horse left the highway, was defective for want of a railing as to persons using the highway in the usual manner, the town is not liable for the occurrence arising from the horse's being frightened and running away, as is stated in the finding.

5. That if the injury from which the deceased died was caused by the horses's turning suddenly after it had left the highway, in the adjoining field, and thereby overturning the carriage and throwing the deceased upon the ground, the injury was not caused by the defect in the highway.

6. The defect in the highway of the want of a railing was not the proximate cause of the injury of the deceased, Mrs. Upton.

7. That even if a railing, sufficient to protect ordinary travel, was required at the place of the occurrence, yet, if such a railing would not have prevented a frightened horse from going down from the highway into the adjoining field, the town was not liable in this case.

8. That even if a railing sufficient to protect ordinary travel was required at such a place, and the highway was defective for want of such railing, as against ordinary travellers, the town was not liable in this case, as the occurrence by which the plaintiff's intestate was injured was not received in the usual common use of a highway, but was an extraordinary occurrence.

9. That upon the facts judgment should have been rendered for the plaintiff for nominal damages only.

Orient Enlargement.

The remarkable success that has attended the Orient interests this year has had its natural result. The demand for additional factory facilities has led to the placing of a contract for the erection of another wing, 120 by 40 feet, to the plant at Waltham. At present the offices and assembling and shipping rooms are located in the factory building. When completed they will be removed to the new addition, thus affording room for more men and machines in the factory proper.

CLEVELAND'S LATEST

That City of Automobiles Produces Another Car—Some of it Chief Features.

From that home of gasolene vehicle manufacture, Cleveland, hails the American Runabout made by the American Motor Carriage Co., of 514 East Prospect street, and shown herewith in three-quarter rear view.

The American weighs one thousand pounds, has a low center of gravity and a long wheel base. The frame is constructed of angle iron, is well braced and light in weight. Both front and rear axles are of American Ball-Bearing Co. make, equipped

with wooden artillery wheels and 3"x30" detachable tires. The seat is divided, heavily padded and covered with black hand-buffed leather.

The engine is of the four cycle, single cylinder type, water cooled, with ample bearing surfaces, and is claimed to be 5.1 h. p. brake test. The water circulation is by means of a gear pump, keyed direct to the end of the crank shaft and hung on a bracket attached to the side of the crank pit. The water tank is located in the front hood and has a capacity of five gallons, while an efficient coil of brass tubing is hung beneath, keeping the water at the required temperature.

A float feed vaporizer is located in a convenient position and protected from dust. It is supplied from a tank carrying seven gallons, is located near the cylinder, obviating the necessity of long connections and the danger of leaks. The entire lubrication is effected by gravity feed from one tank, and is turned on and off by the same lever that operates the electric switch. The crank pin and transmission are oiled through the center of the crank shaft.

Jump spark ignition is used, with all contact points enclosed in a dust-proof case and so arranged as to insure a square and firm contact, while especial attention is given to the system of wiring. All wires have heavy rubber insulation and are finished off with stamped copper terminals. The current is supplied by one of two sets of dry batteries; the other is used as a reserve. The muffler is of ample proportions to effectively deaden the exhaust and to prevent back pressure.

The transmission, an embodiment of the planetory system, gives two speeds forward and one reverse. With the aid of the engine throttle, it gives an ideal control. A one-inch roller chain drives direct to the rear axle, and is adjusted by means of a pair of sliding spring blocks. A double-acting brake is located on the drum of the compensating gear and can be locked in any position by means of a ratchet.

The steering gear, operated by a large wooden-rimmed wheel, contains a system of gears to overcome the jar of the road, while the front wheels are slightly pitched inward, after the manner of the most modern power road vehicles. The steering post contains a knuckle joint, making it possible to throw the hand-wheel out of the way while entering or leaving the seat.

The Week's Exports.

British East India.—3 cases auto vehicles and parts, $1,022.

Havre.—16 cases motors, $800.

Liverpool.—4 cases auto vehicles and parts, $1,470.

London.—10 cases auto vehicle parts, $1,426.

Mexico.—3 cases auto vehicles and materials, $890.

British East Indies.—1 case auto vehicle, $800.

Copenhagen.—3 cases auto vehicles and material, $1,150.

London.—3 cases auto vehicles, $400.

Mexico.—6 cases auto vehicle material, $1,248.

OPERATORS BLAMED

Famous Tire Maker Charges Them With Many Tire Troubles and Cites Instances.

The Michelin Co., in one of their recent articles on pneumatic tires, remark that if they had to make a list of the enemies of the motor car driver they would without hesitation put the driver himself at the top. This is to a great extent true, one of the most frequent causes of damage to pneumatics being insufficient inflation. In the Michelin handbook there is a table of pressures to which various tires should be inflated.

Not only must tires be pumped up properly, but the fixing bolts must also be well screwed up. Should they be slack the cover tends to move in the rim and the thickened edge gets damaged. At high speeds the cover turns bodily in the rim and this invariably tears the valve out of the tube. Moreover, if the tire is not sufficiently inflated, and the bolts screwed well up, water is sure to get in, and then the cover lasts a very short time. As for the bolts themselves, care should be taken that the canvas covering is always intact, otherwise damage to the air tube will result. For the same reason bent bolts should never be used, as they do not seat properly.

One very often hears people say that they can "get home" with a deflated tire. This is most unfair to the tire. In case of puncture, unless the sacrifice of a cover and tube is of small moment, the tube should be changed at once. Even in a short distance the cover is generally much damaged, and the valve pulled out of the tube. If it is decided to go on at all costs, the inner tube should be removed, the fixing bolt screwed firmly up, and the cover fastened with leather straps. If these are not obtainable rope will do, but it will not last so long. After running on a deflated tire the rim should be carefully examined to see if it is dented. This often occurs, and the edge of a new cover is with difficulty inserted in the recess. It can, of course, be forced in, but the rim afterward invariably cuts the cover.

Recent Incorporations.

Stamford, Conn.—H. A. Tuttle Mfg. Co., with $100,000 capital, to manufacture and deal in motors, engines, etc.

New York, N. Y.—Columbia Lubricant Co., with $100,000 capital. Directors, G. K. Bell, G. E. Macoy and E. M. Strong.

New York, N. Y.—American Automobile Storage Co., with $5,000 capital. Directors, W. T. Rainey, R. A. Rainey and R. M. Owen.

Binghamton, N. Y.—Safety Sectional Pneumatic Tire Co., with $500,000 capital. Directors, E. C. Inderlied, O. S. Heller and B. A. Beaumann.

Augusta, Me.—American Automobile Co., with $500,000 capital. Incorporators, F. L. Dutton and E. F. Whittum.

EXPECTED TOO MUCH

He Wanted a Plug to Work Without Care no Matter the Price.

"Have you got a good sparking plug?" was the question asked of the salesman in an uptown store, and the doubting way in which it was asked led the Motor World man to await the reply.

"Of course we have," was the quick reply, as the salesman laid a few plugs on the counter. "Here's the Blank and the So-anso and——"

"Yes, I've tried all them," the customer remarked without ceremony, "but I want something that is good. I am willing to pay any price for it if only it will do the work."

"Why, yes, here is just the plug you want," the salesman replied, seeing the direction from which the wind blew. "It's more expensive than the ordinary plug, but then it is worth the difference. It is guaranteed not to crack or become clogged with soot or to give trouble in any other way. I think you will find it all right," and he wrapped it up and took the money that was handed him.

After the door closed behind the purchaser the salesman looked at the Motor World man.

"Now I suppose he is satisfied, and will stay so until he uses the plug. The trouble with him is that he expects too much of things. If he uses the plug until it gets so dirty that it won't spark, it is the latter that is to blame, not himself. The plug should not need cleaning, not even if he uses too much oil and it splashes on the plug, or the combustion is imperfect and soot clogs the plug. He wants something that will rise superior to such trifles."

Aspire to be Chauffeurs.

Undeniable as is the present shortage of competent chauffeurs and mecanicians, it is almost equally certain that within a few years the trouble will be obviated. The interest taken in automobiles is great, and the desire to learn all about them keen. Boys and young men especially are hot on the scent, and leave no stone unturned to familiarize themselves with the motor vehicles.

"Having occasion to find a lad, with a good mechanical knowledge, able to take care of two cars and willing to make himself generally useful, I advertised for such a person," says an English automobilist. "To my surprise I received sixty-eight applications. A large proportion of the applicants had not sufficient experience, it is true, and were willing to come at any wage I liked to name, if only to get a start; but many others appeared capable of fulfilling the necessary conditions.

"In their eagerness to obtain a comfortable and permanent home some of them even sent photographs for my inspection, and inclosed stamped envelopes to insure a reply. The difficulty was to make a selection.

"One fact stood out prominently in my mind. Automobilism has evidently taken a firm hold on the community at large, and sharp lads in every town, who have been accustomed to cycle work or to machinery, now aspire to become chauffeurs. Already there are numbers of embryo mechanicians in existence, and, two or three years hence, I venture to prophesy that the supply will equal the demand."

Built for Many Uses.

While primarily intended for the departmental work of inspectors, superintendents, fire and police officials, the vehicle herewith illustrated, made by the Electric Vehicle Co., of Hartford, Conn., is nevertheless adapted for a wide variety of uses and special requirements. The vehicle is known as the new special service wagon. Several of these

vehicles were recently purchased by the New York Edison Company for its inspectors.

The running gear, control and steering are similar to those of the Columbia electric tonneau. The extension back has a large closed c mpartment, opening from the rear, which may be utilized for tools or luggage of any description. The top affords complete protection in stormy weather.

Gives Trouble to All.

The British law fixing the maximum speed of automobiles at 12 miles an hour continues to make trouble for all sorts of people, eminent and otherwise. From noble lords down to plain commoners, including even a prime minister, the list of lawbreakers runs. Last week Generals Corbin and Wood, who are returning to this country after witnessing the German army manœuvres, were added to the number.

On Saturday General Young, in company with John W. Gates, was driving through Windsor when a policeman arrested the chauffeur and took the names and addresses of Mr. Gates and General Young, who were the occupants of the car. Sunday the same party, with General Corbin, was nearing Brighton when a policeman stepped out of a hedge and stopped the car.

When the cases were called up no defence will be made, for, as one of the Americans said, "The police have got you at their mercy. You may be morally sure you were not driving at over the speed limit, but that is ineffective against the police, with their stop watches."

GERMAN ADAPTATIONS

Many Novelties Heralded as From France Claimed as Imitations.

"It would probably surprise you to know that one-half, or nearly one-half, the automobile accessories that come from France to this country, heralded as the latest Parisian productions, are really made in Germany," remarked a well known accessory and parts man to the Motor World representative.

"Such is the case, however. They come to us as French goods, of course," he continued. "But when they are traced to their source the latter is found to be the land of the Kaiser. The Germans are an imitative lot, and there is hardly anything they cannot make. They go at it in their slow, plodding way, but they manage to get hold of a considerable portion of the trade whenever they set themselves to the task."

"It is astonishing what a lot of accessories are bought in the course of a season. One is sometimes compelled to wonder where all the automobilists come from, and to conclude that there are two or three chauffeurs, mecaniciens, etc., for every motor vehicle in existence," said a salesman in a prominent Boston store to a Motor World man a short time ago.

"We keep one of our windows full of such goods. Caps, gloves, goggles and other articles of apparel, together with sparking plugs, pumps, lifting jacks and everything required by the automobilist or his vehicle, are sold in large quantities. We get fairly good prices for most of the stuff, but no one seems to mind that or to think that we are asking too much. They seem to want the goods, and by making a determined push for the class of trade referred to we have managed to secure our full share of it."

Origin of Petrol.

It will undoubtedly be a matter of news to those who read English motoring papers to learn that the word "petrol," which they invariably use as we do the word gasolene, properly describes a proprietary article, and, strictly speaking, should only be applied to a spirit vended by the proprietors of the article. The word used abroad as a noun signifies a light, colorless liquid, obtained by the distillation of petroleum, and forms one of the series of hydrocarbons.

As a proprietary article it is manufactured solely by the firm of Carles, Capel & Leonard, Hackney Wick, London. This firm was requested in the early days of motoring by the Daimler Co., of Coventry, England, to distil a spirit suitable for their motors, and, having done so, they christened the spirit "Petrol," up to then an unknown word. The distillation was so successful and the name so appropriate that it has since come into general use in the land of its origin. At 68 Fahr. the specific gravity of fresh petrol is .676.

THE CASUALTIES OF THE WEEK

RAILROADS {Killed, 141. Injured, 129. **TROLLEYS** {Killed, 19. Injured, 79. **HORSES** {Killed, 11. Injured, 57. **BICYCLES** {Killed, 1. Injured, 10. **AUTOMOBILES** {Killed, 0. Injured, 2.

TOTAL, THIS WEEK: KILLED, 172; INJURED, 277. TOTAL, THREE WEEKS: KILLED, 252; INJURED, 470.

PRIOR TO OCTOBER 6.

Buffalo, N. Y.—George Hall, fell from wagon; died from injuries.
Buffalo, N. Y.—Burton J. Bixby; seriously hurt in runaway
Savanna, Ill.—J. C. Tufts; fell from train; instantly killed.
St. Paul, Minn.—Frank Hockle; thrown from wagon by collision with car; severely hurt.
Fargo, N. D.—James Kennedy; killed by train.
Mankato, Minn.—John Imbole; killed by train.
Fond du Lac, Wis.—Stephen Mullen; killed in coupling cars.
Kalamazoo, Mich.—Mrs. Martin Vanderberg, seriously injured by train.
Bay City, Mich.—Mrs. Edward Robinson; killed by train.
Chicago, Ill.—Morton Frank, driver of express wagon, thrown and injured.
New York—Charles Lovell, driver; thrown and injured.
Cambridge, Me.—Mrs. Lendall Chadbourne; injured by a bicycle.
Cincinnati, O.—William Borman; killed by train.
Toledo, O.—Fink Sherman; killed by trolley.
Birmingham, Ala—Mrs. Carr; injured by trolley car.
Johnstown, Pa.—George Fleischhauer; killed on railroad.
Ridgewood (Brooklyn), N. Y.—Unknown man killed by trolley.
Junction City, Kan.—Joseph Gibson; killed by train
Richmond, Kan.—Willie Chambers; killed by train.
Omaha, Neb.—Charles Murphy; injured by train.
Clinton, N. Y.—Frank Van Allen; killed by trolley.
Waterbury, Conn.—Unknown man; injured by trolley
Manor, Pa.—Howard Row; killed by engine.
Claremont, N. H.—Three men injured in railroad collision.
Rockport, Me.—Herbert Butler; thrown from wagon by collision with train; two broken legs.
Philadelphia, Pa.—William Johnston; struck by train; injured.
Cleveland, O.—Steve Cenchie; run over by heavy wagon.
Port Clinton, O.—Samuel Wardo; killed by train.
Buffalo, N. Y.—Albert Larson; injured by engine.
Cochecton, N. Y.—Albert Butler; fell from train; leg amputated.
Milwaukee, Wis.—John Donavan; killed by train.
Chicago, Ill.—William Bush; killed by train.
Peoria, Ill.—Walter Mooney; killed by train.
Windsor, Conn.—David L. Roberts; killed by trolley.
Brooklyn, N. Y.—John Dempsey; thrown from wagon; severely injured.
Greenfield, Mass.—William H. Wedgewood, George F. Parmenter and Howard P. Smith; killed in railroad collision.
Lowell, Mass.—Edmund O. Knox; thrown from wagon colliding with trolley; injured.
Springfield, Mass.—Roy Willcox; trolley collision; injured.
McKeesport, Pa.—W. A. Gillespie and Thomas Roland; severely injured; railroad.
McKeesport, Pa.—Fred Erhard; killed in coupling cars.
Norwalk, O.—Conductor and three passengers injured in trolley car accident.
Charlottesville, Va.—Brakeman, engineer and fireman injured.
Reelsville, Ind.—George A. Cole, killed, and six men injured; railroad.
South Boston, Mass.—Francis Cappo; injured by car
Chicago, Ill—John Kalbran; killed by train.
North Chelmsford, Mass.—John M. Howe; injured by train.
Plainfield, N. J., Charles Sprague and George Gedner; bicycle collision; injured.
Pittsburg, Pa.—W. E. Ledger and two children thrown from wagon; injured.
Cincinnati, O.—Five persons injured in trolley collision.
Moberly, Mo.—Mrs. James Morton; carriage collided with train; injured.
Lima, O.—John Swartz; killed on railroad.
Huntington, Ind.—John Erb; injured by train.
Olathe, Kan.—William Lamont; killed in coupling cars.
Lakota, N. D.—J. Evans; killed in railroad wreck.
Grand Rapids, Mich.—Mrs. McClure; injured by trolley car.
Norwalk, O.—George Seitchell and J. H. Bull; injured; collision of trolley and train.
Mounds, Ill—Sandy Mandy; killed by engine.
Chicago, Ill.—Trolley car overturned; six passengers bruised.
North Anderson, Ind.—John Welsh; killed by trolley car.
Cleveland, O.—Paul Tladeck; injured by train.
Portsmouth, O.—William Barr; fatally injured by train.
Loveland, O.—William Clarke; killed by train.
Lima, O.—Calvin Reece; killed by train.
Vicksburg, Miss.—J. Hampton Griffing; died from injuries by trolley.
Louisville, Ky.—Samuel W. Dodge; killed in trolley collision.
Gainesville, Tex.—W. C. Leth; killed in wreck; Henry Dick, injured.
Mount Meigs, Ala.—Troup B. Hodges; killed by train.
Lynchburg, Va.—Tilden Alvis; killed by engine.
Richmond, Va.—William Seal; injured by trolley.
South Cumberland, Md.—George Robert; killed by engine; J. K. Kettle, injured.
Greensburg, Pa.—James Reagan; killed by train.
Scottdale, Pa.—Frank Dessalino; killed by train.
Dickerson Run, Pa.—William Gillespie; injured in railroad collision.
Royersford, Pa.—John Plumley; killed by train.
Palmyra, Pa.—Irvin J. Detweiler; injured by train
Missoula, Mont.—William Johnson; killed by train.
Sanfords Corners, N. Y.—J. W. Moore; injured by train.
Hornellsville, N. Y.—William Dottaker; killed by train.
Irish Creek, N. Y.—Robert Stewart; killed by train.
Saratoga, N. Y.—Van Wagner and Butterfield Lackey; injured in trolley collision.
Plaistow, N. H.—John W. Huntress; killed by trolley.
West Somerville, Mass.—Charles Comee; killed by train.
Swampscott, Mass.—William D. Nichols; killed by train.
North Saugus, Mass.—Michael Donovan; killed by trolley.
Mechanics Falls, Me.—Unknown man; killed by engine
Rockville, Ind.—Anthony Tasso; struck by bicycle; killed.
Bath, Me.—A. M. Franks; injured in bicycle collision.
Fremont, O.—Andrew Weiler; injured in buggy colliding with trolley
Fremont, O.—Mr. and Mrs. John Bender; injured in runaway.
Minneapolis, Minn.—Vine Sanback; injured by truck.
Chicago, Ill.—Mrs. Annie Bron; fatally injured by wagon.
Norristown, Pa.—Mr. and Mrs. Joseph Nyce; thrown out of carriage; injured.
North Braddock, Pa.—G. E. Frank Gray; injured in carriage collision.
Gloversville, N. Y.—Richard McDougal; thrown from wagon; injured.
Providence, R. I.—John J. Duffy; killed by wagon.
Haverhill, Mass.—Barney Brickett; injured in wagon collision with trolley.
Castleton, Vt.—Mrs. Jacob Mound; fell from carriage; injured.
Salem, N. H.—Charles H. Smith; seriously injured by fall from wagon.
Portland, Me.—Driver injured in a runaway.
Pinckney, N. Y.—Charles Carpenter; killed by fall from wagon.
Woburn, Mass—John J. Loftus; killed by trolley.
Binghamton, N. Y.—Michael Kane; killed by train.
Penn Yan, N. Y.—Lawrence Laughran; killed by train.
Middleboro, Mass.—Clarence P. Waul; killed by train.
San Francisco, Cal.—William Rosekamp; fell from wagon; killed.
Los Angeles, Cal.—Roy Judsons; killed by horse's kick.
Peoria, Ill.—Walter Mooney; killed by train.
Ingersoll, Can.—John O'Callaghan; killed by engine
Hornellsville, N. Y.—William Doltage; killed by train.
Seward, Pa.—David B. Wineland; killed by engine.
Brazil, Ind.—Railroad collision; two killed and six injured
Birmingham, Ala.—Johnnie Reese; killed by train.
Baltimore, Md.—Unknown man; killed by trolley car.
Middletown, O.—Edward Connor; killed by train.
Cincinnati, O.—Harry Winters; killed by train.
La Crosse, Wis.—Leslie Chase; killed in railroad wreck.
Huron, S. D.—Fay Jones; killed by train.
Columbus, O.—Christopher Lengeloh; killed by train.
Cleveland, O.—Henry Jacobson; killed by engine.
Cleveland, O.—Carl Bunders; fell from car; injured.
Cleveland, O.—William Brown; struck by trolley; injured.
Dayton, O.—John Natto; fatally injured by train.
Billings, Mont.—Railroad collision; two dead and eight injured.
St. Louis, Mo.—Mrs. Fischer; killed by trolley car.
Buffaflo, N. Y.—Thomas Burns; fatally injured by trolley car.
St. Thomas, Ont.—William O'Hara; killed by train.
Great Falls, Mont.—Unknown man killed by train.
St. Louis, Mo.—William Smith; killed by train.
Magnolia, Miss.—M. Powers; killed by train.
Dixon, Cal.—Collision; passenger killed; engineer injured.
Springfield, Me.—A. S. Hardin; killed by train.
Torreon, Mex.—Engine and tank overturned, killing two and injuring one.
Obe, Ga.—Lawson W. Knight; killed by train.
Comer, Ga.—John Floyd; killed by train.
Cold Springs, O.—John Cronan; killed by train.
Cincinnati, O.—Three killed by trains within twenty-four hours.
Memphis, Tenn.—Ben Connors; killed by train.
La Junta, Col.—Unknown man killed by train.
Oakland, Cal.—Unknown man killed by train.

OCTOBER 6.

Schenectady, N. Y.—Engineer Olds; killed in collision.
Boston, Mass.—Henry Carey; killed by train.
Newark, N. J.—John Thornton; injured by trolley.
Norristown, Pa.—Louis Bush; killed in coupling cars.
Wellsboro, Pa.—O. Buck; killed by train.
McKeesport, Pa.—Jacob Moritz; fatally injured by wagon.
Hoffmans, N. Y.—William Owens; killed in railroad wreck.
Chicago, Ill.—Paul Fredericks; struck by engine; injured.
Buffalo, N. Y.—Theodore Goldbach; killed by train.
Brooklyn, N. Y.—Frank Mills; caught between cars; injured.
Pittsburg, Pa.—William Jones; struck by engine; injured
Colorado Springs, Col.—John C. Kennedy; struck by train; injured.
Ayer, Mass.—Patrick Organ; killed by engine.
Lancaster, Pa.—John H. Geiszel; killed by train.
Phelps, N. Y.—Lawrence Dunn; killed in runaway.
Atlanta, Ga.—Trolley car ditched and two injured.
Pittsburg, Pa.—G. A. Hammer; injured by trolley.
Findlay, O.—Jesse Deckman; struck by trolley; injured.
Washington, D. C.—Richard Bowers; struck by trolley; injured.
Beaver, Pa.—Trolley collided with runabout; two injured.
Plainfield, N. J.—Nicholas Kelley; injured by trolley car.
Altoona, Pa.—William McGirk, jr.; killed by train.
Reading, Pa.—Harry Greenwalt; injured by train.
Martel, O.—Alice Collins; killed by train.
St. Paul, Minn.—Andrew Goreske; killed by horse.
Troy, N. H.—Fred Cobb; killed by train.
Turtle Point, Pa.—J. C. Duell; killed by train.
Roanoke, Va.—Railroad collision; engineer killed and fireman injured.
Richmond, Va.—Clyde Anderson; injured by trolley car.
Steubenville, O.—Anthony Bell; killed by train.

Digitized by Google

Rockford, Ill.—Edward Crawford; thrown from wagon; injured.
St. Louis, Mo.—Trolley car overturned carriage; four injured.
Passaic, N. J.—John J. Ashley; injured by trolley car.
Indianapolis, Ind.—Oliver Sisher; injured by train.
Kansas City, Mo.—Earl Pittman; injured by buggy.
St. Joseph, Mo.—Peter Pauly; injured by train.
St. Louis, Mo.—William Breeher; killed by trolley car.
Indianapolis, Ind.—T. O. B. Hessling; injuries by trolley car.
Indianapolis, Ind.—Driver injured by collision with trolley.
Grand Rapids, Mich.—George Armstrout; killed by train.
Sulphur Springs, Tex.—J. A. Key; killed in railroad wreck.
Milwaukee, Wis.—Albert Scheerbarth; killed by train.
Racine, Wis.—Robert Williams; injured by wagon.
Racine, Wis.—Christopher Rood; injured by train.

OCTOBER 7.

Castle Hill, Mass.—Mrs. Charles B. Ferguson; killed by train.
Lynn, Mass.—Henry French; killed by vicious horse.
Galva, Ill.—Fireman Sands; killed in railroad wreck, and Engineer Johnson injured.
Granville, N. Y.—Miss Eustacia Cody; killed by train.
Worcester, Mass.—Runaway; two injured.
Dansville, N. Y.—Josiah Titsworth; fatally injured in runaway.
Newark, N. J.—David Dunham; injured by truck.
Paterson, N. J.—Wagon driver injured by trolley car.
Worcester, Mass.—Collision; one passenger injured.
Cadosia, N. Y.—Arthur Benedict; killed by train.
Thompsonville, Conn.—Timothy Sullivan; killed by train.
Lancaster, Pa.—Thomas Ryan; killed by train.
Toledo, O.—Mrs. Norah Phelan; injured in runaway.
Zanesville, O.—Mrs. Elizabeth Tewell; killed by train.
Columbus, O.—Ralph Edmundson; injured by train.
Cadillac, Mich.—Edward Brewer; leg cut off by train.
Providence, R. I.—Eddie Plante; injured by trolley car.
Pawtucket, R. I.—Daniel Bethel; injured by car.
Holyoke, Mass.—Trolley car struck team; two injured.
Franklin, N. H.—Sibley M. Crosby; injured by handcar.
Westfield, Mass.—Bicycle collision; both parties injured.
St. Louis, Mo.—Hazel Butler; injured by car.
Washington, D. C.—Nellie Sullivan; injured by wagon.
Thompsonville, Conn.—George Darling; injured by train.
South Burlington, Vt.—Runaway; one killed and one injured.
Norfolk, Va.—Lindsay Mowrey; injured by car.
St. Louis, Mo.—Henry Augustine; injured by trolley car.
Atlanta, Ga.—Manley Hazzard; injured by car.
St. Louis, Mo.—Willie Becker; injured by wagon.
Toledo, O.—Mrs. Henry Eppler; killed by trolley car.
St. Louis, Mo.—Harry Lynch; injured by wagon.
Indianapolis, Ind.—Tilly Hawkins; killed by trolley car.
Winona, Minn.—Jacob Herrman, killed by train.
Cleveland, O.—Trolley struck automobile, injuring Harry Edmonds.
Holyoke, Mass.—Joseph Toepfert; injured by trolley car.

OCTOBER 8.

Hackensack, N. J.—Rev. Arthur Johnson, injured by wagon.
Menlo Park, N. J.—One killed and six injured in railroad collision.
New Haven—Frank Schipper, injured by trolley car.
Nutley, N. J.—John McCarthy, injured in runaway.
Attleboro, Mass.—George Hill, killed by train.
New York—Two injured by trolley car.
New York—Dora Lampert, killed by trolley car.
New York—J. H. Butler, injured by trolley car.
Washington, Pa.—Five killed in railroad collision.
Philadelphia, Pa.—John Dougherty, killed by train.
Boston, Mass.—Thomas Norton, injured by wagon.
Philadelphia, Pa.—Trolley car collision; two injured.
Jamaica, L. I.—Wm. J. Palmer, injured by trolley car.
Cannonsburg, Pa.—Collision; five killed and fifteen injured.
Seward, Pa.—Train struck wagon; one killed, three injured.
Leighton, Pa.—Rev. B. C. Krupp, injured by bicycle.
Constableville, N. Y.—Dennis Collins, killed in runaway.
Vestal, N. Y.—Bert Noble, injured by trolley car.
Buffalo, N. Y.—Anthony Pax, injured by trolley car.
Elmira, N. Y.—Mrs. Sarah Hennessy, killed by train.
Buffalo, N. Y.—John Vallen, injured by train.
Kansas City, Mo.—Trolley collision; Conductor Burghart injured.
Steubenville, O.—Amate Pavole, killed by train.
Paw Paw, W. Va.—Adolf Miller, killed by train.
Lima, O.—Miss B. Nichols, injured in runaway.
Alliance, O.—Roy Sprowl, injured by fall from bicycle.
Washington, D. C.—Tony Damenico, injured by trolley car.
Cordova, Ala.—L. P. Porter, injured by train.
Middletown, N. Y.—Benjamin Corwin, injured by wagon.
Middletown, Conn.—Miss L. Fowler, injured by train.
Harrisburg, Pa.—Miss V. Strouse, injured by bicycle.
Cleveland, O.—Henry Boggis, struck by car.
Cleveland, O.—Chester Burns, injured by carriage.
Wheelocksville, Mass.—One injured by trolley car.
Elmira, N. Y.—Thos. Jerell, injured by train.
Harrisburg, Pa.—Henry S. Pentz, injured in runaway.
Youngstown, O.—Harry Tod, killed by train, one other injured.

OCTOBER 9.

Rockville Centre, L. I.—Lewis Robbins, killed by train.
Brooklyn, N. Y.—Gertrude Straub, injured by trolley.
Boston, Mass.—Wm. J. Terry, killed on railroad.
Boston, Mass.—Andrew Bailey, injured by engine.
New York—Trolley car struck wagon; driver injured.
Suffield, Mass.—Wm. H. Lillie, injured in runaway.
Danbury, Conn.—Railroad collision; two killed and twenty seriously hurt.
Johnstown, Pa.—Wagon struck by trolley; one killed, three injured.
Woodbury, N. J.—Thomas Penn, killed by train.
Johnstown, Pa.—George Rodenbaugh, killed by train.
Cleveland, O.—John Berry, fatily injured by wagon.
East Hartford, Conn.—Wm. Merritt, injured in runaway.
Hartford, Conn.—John McDonough; leg crushed by train.
Providence, R. I.—Boy injured by wagon.
East Hilburn, N. Y.—Geo. Nicholas, injured by wagon.
Marlboro, Mass.—Mrs. C. C. Bliss, injured in runaway.
Laconia, N. H.—George Eastman, injured by wagon.
Hoboken, N. J.—John Flemming, injured by trolley car.
Weehawken, N. J.—William Burns, killed by train.
Newark, O.—Dudley A. De Bolt, killed by train.
Alliance, O.—Railroad collision; conductor killed.
Green Island, N. Y.—John Molloy, injured by train.
Seaford, Del.—Mrs. J. J. Truitt, injured in runaway.
Altoona, Pa.—George M. Boyle, hand crushed by car wheels.
South Coventry, Conn.—Thos. Mullen, killed by train.
Pitcairn, Pa.—Unknown man, injured by train.

OCTOBER 10.

Pittsburg, Pa.—August Knope, killed by train.
Pittsburg, Pa.—Dudley Conley, injured by carriage.
Waterville, Me.—Jos. Cummings, injured by train.
Westfield, Wis.—Wm. Hines, killed by engine.
Terre Haute, Ind.—Railroad collision; two killed, six injured.
Wakefield, Mass.—Michael Halliday, injured by train.
Wallingford, Conn.—John W. Mix, killed by train.
Boston, Mass.—Mrs. D. Monahan, injured by wagon.
Johnstown, Pa.—John Kelly, killed by trolley.
Newark, N. J.—John Downey, injured by fall from bicycle.
Valhalla, N. Y.—Christina Diguindo, killed by train.

OCTOBER 11.

New York—Motorman injured in collision.
Bennington, Vt.—Joseph Bennett, killed by train.
Jones Point, Mass.—Three boys killed by train
Boston, Mass.—One injured in runaway.
Boston, Mass.—Wm. J. Murphy, injured by herdic.
Pittsfield, Mass.—Gov. Crane, injured by fall from carriage.
Brooklyn, N. Y.—Benjamin Mason, killed by train.
Great Notch, N. J.—Frank Miller, killed by train.
New York—Thomas Vestor, injured by truck.
New York—Louis Visson, killed by trolley.
New York—John Kennedy, injured by trolley car.

OCTOBER 12.

Boston, Mass.—Col. Wm. H. Oakes, injured by fire engine.
Woodlawn, N. Y.—Wm. Parkinson, injured by train.
Newark, N. J.—Railroad accident, two injured.
Altoona, Pa.—Railroad collision; two killed, two injured.

OCTOBER 13.

New York—Wm. Meyer, injured by wagon.
Bridgeport, Conn.—Sidney M. Brewster, killed in runaway.

AUTOMOBILE ACCIDENTS.

OCTOBER 8.

Plainfield, N. J.—Leona Jardot, struck by automobile; not seriously injured.
New York—Automobile struck cab; driver thrown, but not injured.

OCTOBER 12.

Mount Vernon, N. Y.—Wm. Webber, slightly burned by gasolene tank of automobile catching fire.

England's Casuality List.

Some instructive, not to say startling, figures result from a table of accidents caused by horses, which is being compiled by the Autocar. The table is confined to accidents occurring in Englanr, reports of which appear in the newspapers. It is shown that in the nineteen days covered by the investigation 32 persons were killed and 243 injured by the "uncontrollable horse," as it is termed. On one day, September 6, 3 persons were killed and 25 injured, and on another, September 11, 8 accidents resulted in 4 deaths and 4 injuries. In accounting for the small number of accidents covered by the table, the Autocar remarks:

"Hundreds of horse accidents occur of which no mention is ever made in the daily or local press. This every one knows, as the chances are all against ordinary horse accidents being mentioned at all unless they should come under the notice of a representative of a paper, except, of course, in the case of really serious affairs, such as those which necessitate coroners' inquests, while any accident caused by a motor is always reported."

Diversions of Paris Police.

As the chauffeurs are returning to Paris, the holidays being over, the cycling policemen are renewing hostilities with a vigor worthy of a better cause. A policeman on a motor bicycle was seen exploring each alley of the Bois with a spyglass. As soon as he sees a chauffeur he presses his chronometer, and the victim is "held up." "Où que vous allez comme ça?" exclaims the spyglass man. "You are flying at 60 kilometres! Show me your papers."

As a rule foreigners drive faster than the Parisian chauffeurs. They are caught, of course, but outside Paris they fly "at 60 kilometres" and have nothing to fear.

The Week's Patents.

710,312. Igniter for Explosive Engines. Howard E. Barlow, Providence, R. I., assignor of one-half to Louis H. Schneider, Boston, Mass. Filed July 25, 1901. Serial No. 69,650. (No model.)

Claim.—1. In an explosive engine, the combination with the piston and cylinder of a chamber communicating with the compression end of the cylinder, an ignition device located in the chamber, a pressure device, a passage connecting the pressure device with the cylinder and so disposed as to be covered by the piston at the latter part of its compression stroke, and a pipe connecting the pressure device with the ignition chamber.

710,329. Explosive Engine for Motor Vehicles. Roy C. Marks, San Diego, Cal. Filed Sept. 7, 1901. Serial No. 74,654. (No model.)

Claim.—1. A gas operated motor having a crank shaft, a crank casing, a recessed fly wheel into which said casing extends to form a closed chamber, valve operating mechanism contained within said chamber, and gearing connecting said valve operating mechanism to the crank shaft.

710,330. Carbureter for Explosive Engines. Roy C. Marks, San Francisco, Cal. Filed Jan. 2, 1902. Serial No. 88,236. (No model.)

Claim.—1. The combination in a carbureter, of an oil tank or reservoir having at one end a carbureting chamber, a valve for controlling the flow of hydrocarbon from the reservoir to the chamber, gauge glass arranged on one side of said chamber, a series of superposed shelves in the carbureting chamber, absorbent material on said shelves, side wicks for conveying hydrocarbon from the lower portion of the chamber to the absorbent material, and a ported air valve arranged in the upper portion of said carbureting chamber.

710,385. Gas Engine. George Westinghouse, Pittsburg, Pa. Filed Jan. 31, 1898. Serial No. 668,558. (No model.)

Claim.—1. In a gas engine, the combination with a cylinder having a cooling jacket provided with an inlet port at one end and an outlet port at the other end, of a cooling fluid inlet pipe provided with a controlling valve, a cooling fluid outlet pipe containing a thermostatic device and a pair of coacting levers interposed between the thermostatic device and the inlet controlling valve, whereby the inflow of the cooling fluid is controlled by the temperature of the fluid as it is discharged from the jacket.

710,003. Automobile. Hermann Lemp, Lynn, Mass., assignor to Elihu Thomson, Swampscott, Mass. Filed March 28, 1900. Serial No. 10,448. (No model.)

Claim.—1. The combination, in a vehicle, of fixed front and rear axles, a triangular frame rigidly connected at two points with the front axle and pivotally connected at a single point to the rear axle, driving wheels and motors supported on the rear axle and located between the pivotal point of the triangular frame and the driving wheels.

710,483. Internal combustion engine. Patrick F. Maccallum, Fairbank, Helensburgh, Scotland. Original application filed May 7. 1901. Serial No. 59,128. Divided and this aplication filed February 13, 1902. Serial No. 93,953. (No model.)

Claim.—In an internal combustion engine, means for maintaining the working cylinder and piston at a low temperature and for keeping the piston free from grit and dirt, said means comprising in combination an annular water or other liquid holding space formed in the working cylinder around the piston, an expansion cylinder of larger diameter than the piston, doors for access to said liquid space, and a packing and scraping ring to prevent downward leakage of water and access of dirt or grit to the walls of the working cylinder.

710,500. Variable speed gearing. George E. McElroy, Brooklyn, N. Y., assignor to the Champion Mfg. Co., Brooklyn, N. Y. Filed January 23, 1902. Serial No. 90,886. (No model.)

Claim.—1. The combination with a driving shaft, two gears fixed thereon, of two connected disks rotatably mounted upon the driving shaft, a sprocket connected with said disks, two sets of gears mounted upon shafts passing between the disks, one set of gears meshing with one of the gears fixed upon the driving shaft, and the other set of gears meshing with intermediate gears which in turn mesh with the other gear fixed upon the driving shaft, the shafts passing between the disks, the intermediate gears, two independent loose internal gears engaging the gears mounted upon the shafts passing between the disks; means for holding either of said internal gears against rotation, and means for locking the disks to the driving shaft, substantially as shown and described.

710,508. Safety stop for automobiles. Charles A. Ott, Pawtucket, R. I. Filed February 7, 1902. Serial No. 93,081. (No model.)

Claim.—In a safety stop for automobiles, a tubular casing having a transverse partition provided with a port, an inlet in the casing for the passage of steam through said port, a throttle valve mounted in the casing, and a hand lever to actuate said throttle valve in the opening and closing of the said port, in combination therewith, of a rod vertically mounted in said casing in the rear of the throttle valve thereof, said casing having a transverse partition from either side of said rod and provided with a port, a valve disk rigidly secured upon said rod, a cross lever connected to the upper end of said rod and having its forward portion pivotally connected upon an arm integral with the casing and its rearward portion terminating in a wide blade, a seat rigidly secured upon the blade portion of said cross lever, with a coil spring surrounding the said rod and interposed between its valve disk and said casing, respectively, as shown and for the purpose specified.

710,595. Cushion tire. Charles Miller, Binghamton, N. Y. Filed October 29, 1901. Serial No. 80,392. (No model.)

Claim.—1. The combination with the rim of a wheel, of a recessed core and a block on which said core rests, said block resting on said rim, an outer casing for said core and means for securing said casing to said rim and adjusting devices connected with said rim whereby said block may be pressed outward and said core likewise pressed outward into said outer casing, substantially as and for the purposes described.

710,630. Motor vehicle. Charles F. Thoms, Highlandtown, Md., assignor of one-half to David Wright, Highlandtown, Md. Filed June 20, 1902. Serial No. 112,486. (No model.)

Claim.—1. In a motor vehicle, a sheet metal body the four sides of which are provided at their lower ends with inwardly projected flanges, angle plates and resting upon said flanges and supporting the seat, and a sheet metal plate forming a combined seat and back and provided with flanges at its edges.

710,646. Carburetter. Ora W. Williams, Cleveland, Ohio. Filed September 30, 1901. Serial No. 77,052. (No model.)

Claim.—1. A carburetter for explosive engines comprising a liquid fuel tank, a mixing chamber communicating therewith, a valve casing; and independently adjustable non-communicating valves arranged within said casing and having independent communications with the mixing chamber, one of said valves governing the supply of air to the chamber and the other the outflow of admixed air and vapor from the chamber to the engine, substantially as described.

710,647. Speed regulator for explosive engines. Louis W. Witry, Waterloo, Iowa. Filed June 11, 1901. Serial No. 64,125. (No model.)

Claim.—1. A combined igniter trip guide and admission valve locking device for gasolene engines, consisting of a combination of an exhaust valve, an admission valve, an exhaust valve stem, an admission valve stem, springs surrounding said valve stems adapted to retain the valves on their seats, an arm slidable upon said admission valve stem for increasing the tension on admission valve spring when exhaust valve is open, an igniter, an igniter trip rod having a catch and wedge for effecting contact with and releasing igniter hammer, means for guiding said igniter trip rod in its horizontal and vertical movements, and means for communicating horizontal and vertical reciprocatory movements to said igniter trip rod, all substantially as shown and described.

710,727. Explosion engine. Walter G. Wilson, Westminster, England. Filed November 1, 1900. Serial No. 35,168. (No model.)

Claim.—1. An explosion engine comprising a plurality of pairs of cylinders, one cylinder of each pair being on one side of the crank shaft and the other being on the other side of the crank shaft, pistons in the said cylinders, cranks on said crank shaft of opposite throw for each pair of pistons, each pair having thus the same phase, the whole being arranged in such manner that there are as many equidistant phases as there are pairs, means for connecting the said pistons and their cranks and means for causing the suctions, compressions, explosions and exhausts to take place in rotation in the cylinders, first on one side of the crank shaft and then on the other side of the crank shaft, substantially as and for the purpose set forth.

710,728. Valve and valve mechanism for gas engines. William O. Worth, Chicago, Ill. Divided and this application filed May 28, 1900. Serial No. 18,268. (No model.)

Claim.—1. A gas engine comprising a cylinder, a reciprocating valve within said cylinder, a chamber outside of said cylinder for containing the valve moving mechanism, covered by said valve, a mechanism within said chamber for operating said valve, a connection within the limits of the said chamber, between said valve and said mechanism, and a means for imparting motion to said mechanism for moving the valve intermittently, substantially as set forth.

710,771. Sparking device for explosive engines. Theodore S. Glover, East Norwalk, Conn., assignor of one-half to Cyrus E. Crabbe, Stamford, Conn. Filed April 15, 1901. Renewed April 16, 1902. Serial No. 103,201. (No model.)

Claim.—1. A sparking device for explosive engines comprising two movable contact points or electrodes, one adapted to make wiping contact with the other, and means for adjusting the speed of the wiping action.

710,793. Pneumatic tire. Frank Mitchell,

Digitized by Google

London, England. Filed July 8, 1902. Serial No. 114,752. (No model.)

Claim.—1. A pneumatic tire containing a number of closed air chambers made of india rubber arranged inside a canvas bag, the requisite air pressure in the chambers being produced by external pressure prior to closing the bag.

710,809. Truck frame for motor cars. Albert Schmid, Havre, France. Filed January 28, 1902. Serial No. 91,606. (No model.)

Claim.—A motor car having a truck frame made in two separate and independent parts, independently mounted, one of said parts carrying the motor and driving gear, the other part carrying the car body and being hinged on one of the truck axles and arranged to be swung upwardly to give access to the driving mechanism, said body when lowered resting on springs on the front and rear axles; substantially as described.

710,824. Incandescent igniter for explosive engines. Carl W. Weiss, New York, N. Y., assignor of one-half to August Mietz, New York, N. Y. Original application filed November 10, 1898. Serial No. 696,017. Divided and this application filed April 14, 1902. Serial No. 102,739. (No model.)

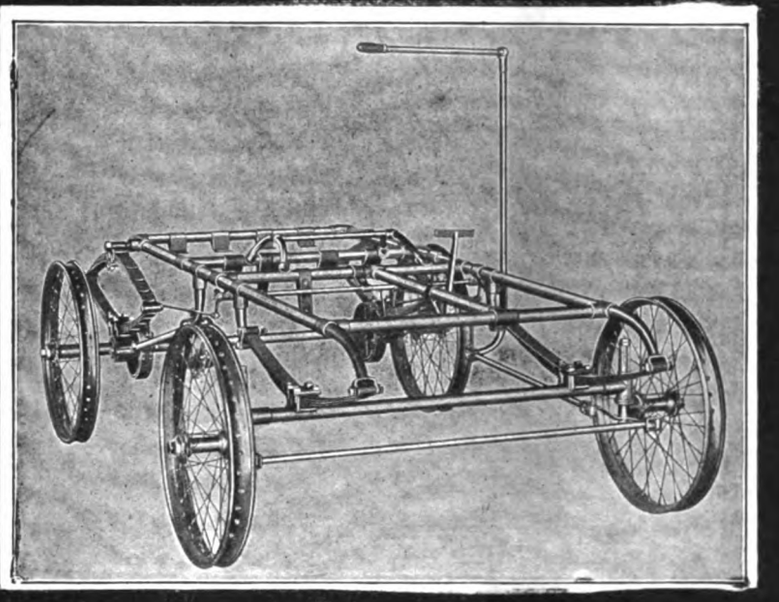
Claim.—1. In an explosive engine, the combination with a tubular extension or shell extended rearwardly from the cylinder head, of an independent, tubular igniting ignition tube, open at its forward end only, placed loosely within said shell or extension, substantially as described.

710,841. Mixing Valve for Gas or Gasolene Engines. Alanson P. Brush, Detroit, Mich. Filed June 10, 1901. Renewed Sept. 11, 1902. Serial No. 122,961. (No model.)

Claim.—1. In a mixing valve of the vacuum opening type, the combination with a valve case formed with an air chamber provided with a port leading thereinto, of a tubular rotatable and reciprocatory mixing valve constructed with a closed head and with a port whereby said chamber may communicate with the interior of the valve, and a gasolene inlet valve leading into the interior of the tubular valve, said gasolene inlet valve opened by unseating the tubular valve.

710,849. Valve for Gas or Gasolene Engines. Alanson P. Brush, Detroit, Mich. Filed Oct. 4, 1900. Serial No. 31,991. (No model.)

Claim.—1. A vacuum opening valve having in combination a valve case formed with an interior passage, air and gas inlets to said passage, a partition or diaphragm between said inlets lengthwise of the passage, a rotatable valve seating at the base of the case, a second partition circularly movable with the valve within the case, whereby said passage is divided into air and gas chambers of relatively variable size.



710,911. Gas Engine Cylinder. Hermann E. Ebbs, Nuremberg, Germany, assignor to Vereinigte Maschinenfabrik Augsburg and Maschinenbaugesellschaft Nurnberg A. G., Nuremberg, Germany. Filed May 29, 1902. Serial No. 109,462. (No model.)

Claim.—A removable insertion for engine cylinders having exhaust slots for carrying off the waste gases, comprising an outer casing, cooling passages in said casing, an annular exhaust passage, slots through the inner wall of said insertion communicating with the interior of the cylinder and the annular exhaust passage, a discharge socket for the exhaust gases communicating with the annular exhaust passage, and cooling passages in the outer wall of the insertion,

HERCULES RUNNING GEARS

FOR ELECTRIC AND GASOLINE VEHICLES

There are no weak spots in these gears. Don't confound them with gears which have been hastily constructed to meet an early demand from automobile makers.

We also solicit orders for parts of these gears. Their design is original and the construction is sound. Prices and particulars of construction sent upon application.

in the bars between the inner exhaust slots, and extending radially between said inner and outer cooling passages, substantially as and for the objects set forth.

TRADE MARKS.

38,973. Cycles, Motor Vehicles and Their Parts. Fabrique de Moteurs & de Machines. (Ancienne Maison Zurcher, Luthi & Cie). St. Aubin, Switzerland. Filed June 23, 1902.

The word "Zedel." Used since May 1, 1902.

39,009. Hand Lifting Jacks. Covert Manufacturing Company, West Troy, N. Y. Filed Aug. 4, 1902.

The word "Auto." Used since July 8, 1902.

Necessity of High Compression

The value of high compression to gas-enginery is somewhat overshadowed by the difficulties of preventing premature ignitions in the ordinary four-cycle method. If means could be devised for preventing this trouble, a most difficult problem could be solved. High compressions have already been made possible by withholding the fuel from the cylinder until compression is accomplished and also by injecting a waterspray with the charge. Possibly other means of avoiding the troublesome premature ignitions may be discovered. At present, pressures between 90 and 100 pounds are about the limit for gasolene and 120 pounds for the natural and the artificial gases.

Some people are willing to seek the charm of automobiling only if some one gives them free passes.

Continues to Increase.

During the month of August 114,283 passengers were carried by the Interstate Transit Company, the automobile transfer line operating on the Eads bridge between St. Louis and East St. Louis. The average fare is figured at 7¾ cents, making the gross earnings more than $11,500, which exceeds the preceding month's earnings by $1,000 or more.

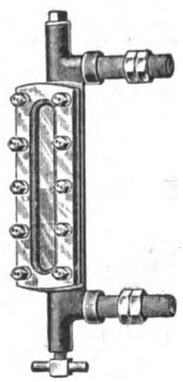
The company is to extend its service on the east side, adding a line from Broadway and Washington avenue across the bridge, to the National Stock Yards, on the east side. Other vehicles will be run in other directions in East St. Louis, practically paralleling the street railway tracks, and a system of transfers will be started. The through vehicles will leave Broadway and Washington avenue, on the St. Louis side of the river, every five minutes, it is announced.

The inception of the automobile service had its origin in disgust which seized a business man over the utterly inadequate street car service across the bridge, and he decided to introduce the horseless carriage, which has proved so successful that it threatens to put street cars out of business.

Turn on the Gasolene.

It is told of a Washington, D. C., physician that not long ago he drove out with a party of friends, whom he entertained at luncheon at a hotel. When the party was ready to resume the trip the car refused to go, and the physician labored for a long time in the fruitless effort to induce it to move.

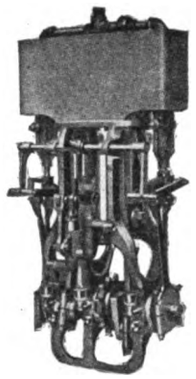
By this time a large crowd had collected, and the party seemed to wonder how it was possible for such a mob to form in such a little while.



Then some rude man in that collection called out at the top of his voice: "Why don't you turn on the gasolene?"

The doctor's facial expression might have meant anything, although he said not a word. But he quietly laid down his tools, his quick eye sought out the man who had made the suggestion, and, in a manner that was Chesterfieldian to the limit, he said: "Thank you."

Then he turned on the gasolene and the car went sailing off as smoothly as a cup defender.



The Reflex Water Gauge

(Klinger's Patent.)
The only water gauge of this kind.
The genuine article.
List Price, $12.00.
Our catalogue No. 4 shows the largest assortment of Automobile Material to be found in the world.

GENUINE
FRENCH SPARK PLUGS
French and American Thread.
Price, $1.00 each.

THIRTEEN TIED FOR PRESIDENT'S CUP

With so Many Perfect Scores, A. C. A. Contest Committee Confesses Inability to Pick a Winner and has Recourse to Novel Procedure—Gold Medals for the Thirteen; Cup to Remain a Club Exhibit.

So marvellously close is the competition for the President's and other cups offered to the cars receiving the highest number of marks in the reliability contest that the contest committee has been compelled to admit that it cannot pick a winner for the first mentioned.

It has decided, therefore, to give to each of the cars making the same record an equal share of the glory. To that end letters have been sent out to the fortunate ones proposing this settlment—that the names of their owners be engraved on the President's Cup and each presented with a gold medal. No opposition to this plan is anticipated.

No less than thirteen cars appear to be tied for first place. Right at their heels is a fourteenth, said to be only one mark, or point, behind its mates, which dispels, in this case, the proverbial ill luck of the number thirteen.

To this number, it is believed, have the the twenty cars claiming clean scores shrunk, the deletion having been made for a variety of causes. Close behind them come several other cars, to which it is proposed to award the three committee cups in the order of their standing.

The information embodied in the foregoing statements was gleaned after a meeting of the contest committee held on Wednesday afternoon at the office of Chairman Scarritt. There the figures in their latest shape were again gone over, and when everything had been considered no way could be seen to award the President's Cup to any one of those tied with 100 per cent without doing an injustice to all the others and causing much dissatisfaction.

It was then proposed that, as all of those with clean scores could fairly lay claim to the cup, the names of all of them should be inscribed upon it; that the cup should then become the property of the club as the joint donation from the several winners of it, and that there should be given to each of those winners a medal suitably inscribed as an individual trophy. It was agreed that this plan would be the best, provided those most interested agreed to it, and the secretary was instructed to write to the several winners and ask their acquiescence.

The idea of the committee is that the second, third and fourth cups are not for perfect scores, and that all those scoring the total of 2,092 points have equal claim to the President's Cup. The next best contestant, the one having 2,091 points—and the contest was as close as this—gets the Scarritt Cup; the next best the Chamberlain Cup, and the next the Hill Cup. It is even possible that there will be ties for these other cups.

The remarkable records made on this run are brought out into relief by an interview which a Motor World representative had with Chairman Scarritt. It was suggested that the rules provide that in case of a tie the committee could award the President's Cup by taking into consideration the general showing, and Mr. Scarritt was asked why this provision had not been sufficient. He replied that several cars had made such an absolutely flawless showing by going all the way without once having been touched with a tool in any way, that this could not be done.

The exact number of those tied with perfect scores has been veiled in considerable mystery. In fact, it has varied from day to day as the figures were repeatedly gone over. That it is likely to be thirteen is based on the following: Chairman Scarritt in speaking of the number said, "It is more than twelve." In going over other details the Motor World man repeated that "the thirteen, then, will be joint winners of the President's Cup and the fourteenth man will get the Scarritt Cup?" Mr. Scarritt answered, "Yes." Subsequently Secretary Butler was asked how it would be possible to get thirteen names on the cup. He said they would be put on small and a plate put on the pedestal telling what the trophy was for.

Dealers to Organize.

Plans are on foot looking to the formation of an association of dealers throughout the country. It is thought that such an organization would redound to their mutual advantage by bringing about an interchange of ideas and securing united action on matters affecting their welfare. Prominent dealers in the East and West are back of the movement, and a great deal of preliminary work has already been done.

Richwine to Succeed Morgan.

The resignation of William Morgan, secretary and sales manager of the Autocar Company, Armore, Pa., has been presented and accepted. He will be succeeded by W. A. Richwine.

Will Not Move for a Year.

It is not likely that the removal of the plant of the Ohio Automobile Company rom Warren, O., to Detroit, Mich., will take place in less than a year.

The Truth Comes Out.

When about a year ago the Motor World reported the absorption of the Overman Automobile Company by the Locomobile Company, officials of the latter were prompt to deny the statement; they also promptly denied that the Riker gasolene car was a Locomobile, affirming that it was an Oversible. The Overman plant at Chicopee Falls is being removed to the Locomobile factory at Bridgeport and the gasolene car will be made there.

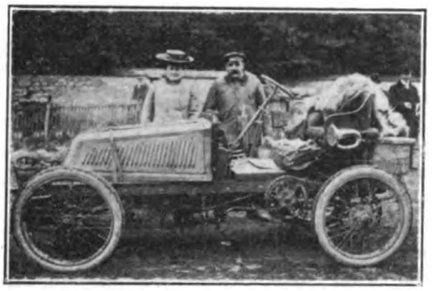
RIVAL HILL CLIMBS

One Fizzled; Second was Stopped by Police; Much is Expected of Third.



Paris, Oct. 10.—If there is one thing worse than doing an evil turn it is in being found out, and in such a case the vengeance is bound to recoil on the head of evildoer. The editor of the Vélo has had plenty of time to ruminate upon the truth of this proposition during the past few days, for having thrown his boomerang with an unskilled hand it has recoiled on him with such a nasty knock that he is not likely to recover from the effects of the blow for a long while to come.

The history of the rivalry between the two Paris automobile papers has already been recounted here on the occasion of the recent Gaillon hill climbing contest. The Vélo, which at one time represented automobile interests here, was unanimously repudiated by the makers and users when the editor took upon himself a few years ago the hopeless task of smashing the Automobile Club, and accompanied the formation of his abortive Moto Club, by publishing a violent manifesto against racing, which did a great deal to foster the ill-feeling against automobilists which was then beginning to show itself in a very unpleasant manner. Fortunately, Giffard's manifesto fizzled out like his club, and the Vélo suffered seriously from this effort to take the interest of automobilism under its injudicious wing.

DUE TO RIVALRY OF PAPERS.

One result of the rivalry between the two papers was seen in the attempt of the Auto-Vélo to suppress the Gaillon hill climbing test, which had been organized for four years in succession by the older journal. The Auto-Vélo threatened to hold a meeting on the same day as that selected for the Gaillon tests, and having thus drawn custom from this event intended to still further demonstrate its influence by organizing another meeting at Gaillon the following Sunday. The shuffling of dates by Giffard prevented this from being carried out, and instead of having simultaneous meetings we were to have three tests on three Sundays running—the first at Gaillon organized by the Vélo, the second at Château-Thierry, and the third at Gaillon, promoted by the Auto-Vélo. As we stated at the time, the Vélo meeting was an utter failure. Nearly all the makers abstained from taking part in it, and only two big cars competed, the light vehicles and motocycles bringing up a meagre total of twenty. That there could be no doubt as to on which side were the sympathies of makers was proved by the splendid success of the Château-Thierry meeting, which brought together upwards of eighty competitors, and all these vehicles were sent to Gaillon on Sunday to participate in the second meeting. Everything pointed to this test being as successful as Château-Thierry. A large number of people undertook the journey from Paris to witness the trials, and many of them went to Vernon the previous day to see the cars as they were weighed, the number in fact being so considerable that the visitors had to wander about Gaillon in search of a place upon which to rest their weary heads.

The meeting was to have started at 9 o'clock and the morning devoted to tests of motocycles and voiturettes, while the other vehicles were to take their turn in the afternoon. Just as the automobilists were preparing to leave Gaillon for the hill which lies about a mile out of the town the organizers received the visit of a captain of gendarmes, who announced that he had instructions from the Prefect to prevent the meeting from being held, even if it were found necessary to fell trees across the road. And then it came out that there had been a conflict between the organizers of the test and the Prefect of the Department, who, according to the new automobile regulations, can sanction

THE NEW BOYER 4 CYLINDER CAR.

or veto meetings, even when approved of by the mayors, in the event of the course encroaching upon more than one commune. The law, however, says that the sanction of the Prefect is not necessary when the meeting takes place in one commune, and when the Prefect refused to give his permission the promoters went to the Minister of the Interior, who personally sanctioned the test, and reassured the promoters by informing them that in this case the Prefect had no authority. Unfortunately it appears that he has jurisdiction over the national highways, whether in one commune or not, and as he was prepared to back up his authority by the force of the army the promoters found themselves under the necessity of postponing the meeting.

Naturally the organizers accused Giffard of having induced the Prefect to veto the rival meeting. Some color is given to this assertion by the statements of the mayors, who affirm that he had asked them not to authorize the Auto-Vélo tests, and though Giffard has been challenged to say on his word of honor that he did not similarly approach the Prefect he has not replied by a direct denial, and his explanation has certainly not given satisfaction to the hundreds of people who were put the expense of making a useless journey to Gaillon on Sunday. Feeling ran so high that when the green paper arrived at Gaillon for gratuitous distribution the enraged automobilists seized the lot and made a bonfire of them. As the result of this incident a deputation of makers, headed by Serpollet, called on the Prefect and pointed out to him the serious consequences that would follow upon the prohibition of the meeting for manufacturers who had spent millions of francs on their cars, and he finally agreed to sanction the meeting for Sunday next.

DESIGNS FOR NEXT YEAR.

The hill climbing tests are usually of a particularly interesting character on account of the fact that, being the last meeting previous to the Paris automobile show, makers are anxious to put their new vehicles to the test, and thus among the cars weighed at Vernon on Saturday there were several new models. De Dietrich et Cie. of Lunéville, who have always identified themselves with the Amédée Bollée system of vehicle with two cyliner horizontal engine, which they still adapt to their industrial cars, have for some months past been building touring and racing cars on the Turcat-Méry system, and at Gaillon they had a new type of racing machine of 30 h. p. The mechanism of this vehicle has been designed upon the lines of the Mercedes with the same system of motor carburetter and transmission, but modified here and there to secure greater simplicity, and in view of the lower power as compared with all the other big French racing machines the new De Dietrich has performed very creditably in the different events in which it has taken part. Another car which has undergone an entire change in design is the Georges Richard, which originally was only constructed as a light carriage with single cylinder motor and belt transmission, but since M. Brasier, the late engineer of Mors, became associated with the Georges Richard Company, they have abandoned their old and somewhat antiquated system and are now following the lead of the big makers. As was to be expected after his long connection with the Mors Company, Brasier has applied to the Georges Richard cars many of the features of the Mors vehicles. He has taken the leading principles of construction, such as the motor and the direct drive on the top speed, and has modified them to secure greater simplicity and efficiency, and it will be interesting to see in the forthcoming tests how far he has succeeded in this experiment. The new Boyer is also an interesting vehicle with four cylinder vertical motor, and in fact the general tendency of makers is to adopt a common type of motor and transmission with slight modifications to prevent the car from being a slavish imitation of the successful vehicles. At one time it was easy enough to tell the make of a car by its external appearance, but nowadays it is a difficult matter to distinguish at a glance one from the other. Fournier was at Gaillon ready to take part in the tests with his big Mors, and this was the first time he had participated in a contest since the Paris-Vienna race. With Fournier, Gabriel, Serpollet and other famous drivers competing on Sunday the strug-

Digitized by Google

gle on the Gaillon hill promises to be of more than ordinary interest.

The Automobile Club has refused to ratify the records at Deauville. This was a foregone conclusion as there was a crushing weight of evidence against the accuracy of the times, and it was clear that while the watches were synchronized before the tests began there was a difference of seven seconds between them when the meeting terminated. In fact the performances of the cars jumped so suddenly from the normal to the abnormal that it was easy to fix the exact time when one of the watches went wrong. The experience has had one good effect, in showing that with the terrific speeds now obtainable with automobiles, it is impossible to rely absolutely upon human timekeepers, and several systems are now being proposed for taking the times mechanically. One of them is to be experimented with at Gaillon on Sunday.

When the automobile globe girdlers, Dr. E. Lehwess and Max Cudell, left Paris in June last with the Passe-Partout, nothing was heard of them for so long a time that it was supposed they had given up the journey, but a few weeks ago we had a line from them from Warsaw and this was followed by a message from St. Petersburg, dated Oct. 3. Dr. Lehwess stated that he has had no end of trouble with the Russian roads, but he has every confidence of getting successfully through his long journey. His next stage is Moscow. The doctor is evidently not hurrying things for he has taken three months to go from Paris to St. Petersburg, and at this rate the Passe-Partout will look a very antiquated vehicle by the time it finishes the journey, if it succeeds in getting round the world at all.

Will Probably Appeal.

There is every probability that the verdict rendered against Felix M. Warburg at Trenton, N. J., a couple of weeks ago will be appealed. Damages in the sum of $12,700 were awarded J. M. Hughes on account of the alleged frightening of his horse by Warburg's automobile at Long Branch, N. J., last summer.

It is understood that Warburg is strongly disposed to appeal, in which stand he is heartily supported by the American Automobile Association and the Automobile Club of America. George F. Chamberlin, of the latter organization, expressed himself as follows regarding the matter:

"We absolutely must put a stop to this practice of suing a motorist for any accident which may or may not have been the fault of the automobilist. We probably will not be able to discourage the suits, but we certainly can prevent such verdicts as this which has been rendered against Mr. Warburg. If a few of the cases of arrest and imprisonment which have been made out against a number of our automobilists are carried to the court of last resort and the plaintiff made to pay the costs the motorphobiac may be just a little more careful how he brings his actions in the future."

ESCAPES THE RAIN

Chicago Club Runs Two-Days Meet — New Classification System Works Well.

Some interesting racing resulted from the two days' meet held by the Chicago Automobile Club on Friday and Saturday of last week. The events were run at the track of the Harlem Jockey Club, which was in fair condition, but rather slow.

The new classification system for gasolene cars was used, and it seemed to be an improvement over the method generally used. Closer finishes in some of the races were witnessed, and the cars as a whole were more evenly matched than is usually the case. The first day's races were witnessed by about 2,000 people, while the second, when the track had dried out somewhat and was much improved, had 3,000 out to witness it. The results were as follows:

FIRST DAY.

Three miles, special invitation, gasolene; three entries—First, Oldsmobile, entered by the Oldsmobile Motor Works and driven by D. B. Huss—time, 6:42; second, Oldsmobile, entered by the Olds Motor Works and driven by J. B. Burdett—time, 6:43.

Ten miles, gasolene, 0.70 to 1.00 class; five entries—First, Peerless, entered and driven by A. C. Banker—time, 17:03; second, Winton, entered and driven by Frank X. Mudd—time, 18:24; third, Winton, entered by Charles H. Tucker and driven by John E. Fry—time, 18:29 2-5.

One mile, steam, stock machines only; five entries—First, Hagaman & Hammerly, entered and driven by L. W. Sheppard, M. D.—time, 1:41 2-5; second locomobile, entered by Andrew J. McDuffee and driven by J. W. Sunderland—time, 1:44 2-5. In this race one of the three Locomobiles caught fire near the finish and was thus prevented from finishing third.

Ten miles, gasolene, 0.50 to 0.70 class; four entries—Won by an Oldsmobile machine entered and driven by J. B. Burdett.

Pursuit race, 0.35 to 0.50 class, time limit 30 minutes; four entries—Each contestant started at a different quarter-mile mark, and as soon as caught by the machine following retired from the race. Won by Oldsmobile entered by Olds Motor Works and driven by D. B. Huss—time, 12:35.

Five miles, handicap; four entries—Won by Winton machine entered by Winton Motor Carriage Co. and driven by Charles B. Shanks—time, 7:17.

Special race between Peerless Yellow Kid, entered and operated by A. C. Banker, and Winton racing machine, entered and driven by Frank X. Mudd. This race of five miles caused the keenest interest of any as being between two specially fast and well known machines. Won by Mr. Mudd—time, 8:35.

SECOND DAY.

Race No. 1.—Five miles, gasolene, 35 to 50 class No. 18—Oldsmobile, entered by Olds Motor Works, operated by D. B. Huss, first—time, 11:13 2-5; No. 19, same make., entered by J. B. Burdette, operated by himself, second; No. 15, Friedman, entered by Friedman Automobile Co., operated by B. M. Young, third; No.10, Oldsmobile, entered by J. E. Stevens, operated by same, fourth.

Race No. 2—Twenty-five miles, all makes, all weights and classes—No. 14, Winton, entered by Winton Motor Co., operated by Charles D. Shanks, first—time, 39:38; No. 2, Winton, entered by Charles H. Tucker, operator John E. Fry, second—time, 41:26; No. 4, Winton make, entered by Frank X. Mudd, operated by him, third.

Race No. 3—Five miles, steam race: No. 11, locomobile, entered by Locomobile Co. of America, operated by Sykes, first—time, 8:04; No. 17, Hagaman & Hammerly, entered by L. W. Shepard, M. D., operated by him, second.

Race No. 4—Five-mile handicap: No. 27 first, autocar, operator F. C. Green—time, 9:49; No. 10 second, Oldsmobile, operator J. E. Stevens; No. 19 third, entered by J. B. Burdett, operator J. B. Burdett.

Race No. 5—Five-mile invitation handicap: No. 18 first, entered by D. B. Huss and operated by him—time, 9:55; No. 19 second, entered by J. B. Burdett, operated by him; No. 23 third, entered by J. Frye, operated by him.

Bostwick Undergoes More Operations.

When A. C. Bostwick was encountered by the Motor World man at Norwalk on Wednesday last he seemed to be in his usual health and spirits. Only two days later, however, he was in a private hospital undergoing a dangerous operation, of which it can only be said that his chances of recovery are good.

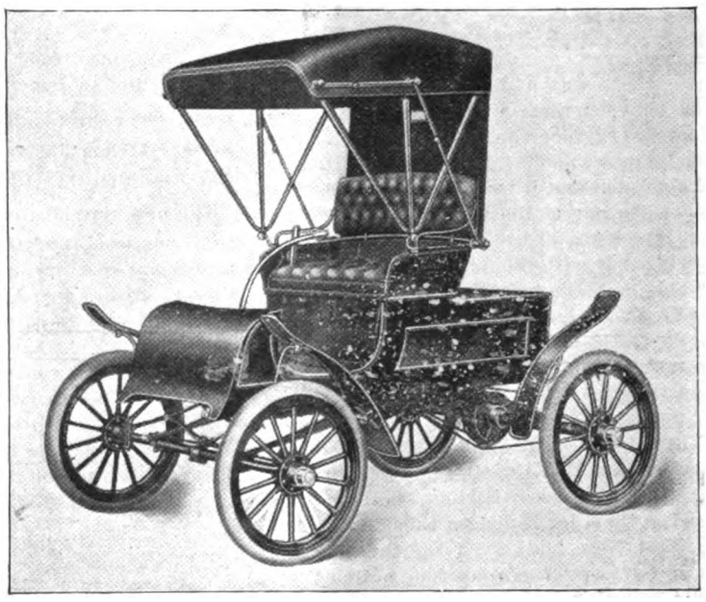
It will be recalled that last spring Mr. Bostwick underwent an operation, and it was thought that it was completely successful in removing the trouble complained of. Such was not the case, however. The former operation, made on the upper part of the well known automobilist's nose, only helped him temporarily. The catarrhal affection which was troubling him was only helped, not cured. So unsatisfactory did his condition become that a second operation was decided upon.

It was performed in Dr. Bull's private hospital in this city. There an operation was performed on him on last Friday for the removal of an abscess in his head. The operation is said to have been difficult, as the growth was within a fraction of an inch of the brain.

On Tuesday it was reported that he will probably have to undergo another operation for abscess, the second within a few days. It was said that it would be only a minor one, not dangerous, nor as serious as the two preceding ones. It will be performed by Dr. Holbrook Curtis, who has charge of the case.

Mr. Bostwick is able to see his intimate friends, and has a telephone at his bedside, by which he can communicate with his wife at Orienta Point.

Joint Exhibit Given Up.



There will be no joint exhibit of American makers under the auspices of the National Association of Automobile Manufacturers at the London shows. The English association of manufacturers has decided to patronize the Crystal Palace show of January, which would conflict with the New York show in Madison Square Garden and it was not deemed politic by the N. A. A. M. committee to attempt an exhibit in London in Agricultural Hall at the other English show in March, so the project is off till 1904.

All Automobiles Run Well in Print

and that's about the only place some of them do run, unless in the hands of an expert operator.

The NORTHERN RUNABOUT

☞ THIS IS HOW IT LOOKS WITH TOP.

RUNS ON THE ROAD and can be operated by anyone.

It doesn't matter what the road is, either up hill or down, in all kinds of weather, and in any climate, the NORTHERN does the work and does it well.

Most people interested in automobiles ought to be interested in the NORTHERN.

NORTHERN MANUFACTURING CO., Detroit, Mich.

AGENTS: { HOMAN & SCHULZ, 100th St. and Broadway, New York, N. Y. ALVIN T. FULLER, 342 Columbus Ave., Boston, Mass.

Cable Address Motorworld.

Entered as second-class matter at the New York, N. Y Post Office, November, 1900.

NEW YORK, OCTOBER 23, 1902.

The accumulation of accident evidence which we have been presenting for several weeks, and will bring to a conclusion next week, tells its own story—a grim, nay, an appalling, one. On the one hand is an enormous number of casualties, many of them fatal, due to causes so closely interwoven with our complex modern life that hope of relief is quite out of the question; on the other is a list of accidents caused by automobiles, insignificant in itself and rendered still more so by comparison with the others.

The Event's Blue Ribbon.

When the president's cup was offered for the best record in the reliability contest it is a pretty safe assertion that neither its donor nor the public understood what prominence it was destined to attain—how large it was to loom before the contest drew to a close.

But there is no longer any disillusion about the matter. The importance of the cup is now well understood. It is the blue ribbon of the event, and as such is coveted with a keenness that has no parallel in the history of the industry in this country. Both as a sportsman's trophy and a splendid advertisement it is valued, and the fortunate owner who gets it will have ample cause to congratulate himself on his success.

When the run drew to a close and it was found that perfect scores were claimed for twenty cars, the disposal of the president's cup and the three others donated by the members of the contest committee did not appear to be an easy matter.

Fortunately, the rules were framed as if in anticipation of such a contingency, although it is doubtful if such a result was really expected. The rule relating to the disposal of the cups contains this paragraph:

"Should two vehicles both receive the same number of marks the committee will decide which vehicle is entitled to the cup, taking into consideration the general performance of each vehicle."

That appears to settle the matter. It is scarcely conceivable that two or more cars should turn out to have performances alike in every particular. Times were taken at 12 controls, and it is quite certain that between them a better record for one car can be figured as compared with another. But even if it were otherwise it would not be a hopeless case. A more meritorious performance would be made by the car which underwent no repairs than by one which did not, even although the repairs had been made at the controls, where no penalty was imposed.

At the same time, it will readily be admitted that the committee's task in awarding the cups is no easy one.

Their announcement is awaited with almost painful interest, and it is no exaggeration to say that hundreds, if not thousands, of dollars would be freely given for the cups if they could be legitimately secured by that means.

THE WEEK'S CASUALTIES.

TOTAL: KILLED, 123; INJURED, 331.

RAILROADS:	**Killed, 105 / Injured, 109.**
TROLLEYS:	**Killed, 13. / Injured, 90.**
HORSES:	**Killed, 5. / Injured, 106.**
BICYCLES:	**Killed, 0. / Injured, 24.**
AUTOMOBILES:	**Killed, 0. / Injured, 2.**

TOTAL, FOUR WEEKS: KILLED, 375; INJURED, 801.

It Fills the Bill.

A problem, the solution of which was attended with no little difficulty, confronted the committee in charge of the Rallability Contest in the matter of tires, and how they should be disposed of in the rules.

Should the policy of eliminating them from the number of penalized stops be continued; and, if this question was answered in the affirmative, would it not defeat one of the objects of the contest, viz.: the desire to obtain complete data regarding the behavior of the motor vehicle in its entirety? Tires form an essential part of the automobile, and their improvement is little, if anything, short of that of the engine, the running gear, etc., in point of importance.

On the other hand, as no maker produces his own tires, would it not be manifestly unfair to hurt his chances, or throw him out utterly, for some circumstance quite beyond his control, such as tire troubles?

An affirmative answer is the only one possible to make to this question. It remained, therefore, to hit upon a way of protecting the vehicle makers from this calamity, and to at the same time keep tab upon the work of the tires.

The plan of non-penalizing tire troubles, and yet obliging the observer to make a careful note of them, along with every other happening, which was the one adopted, was just the thing.

The contest itself furnished abundant proof of the wisdom of this decision. A veritable slaughter would have taken place had tire troubles not been penalized, while to ignore the matter altogether would have been but little less unfortunate. It is not often that a decision is so emphatically justified by the event.

One Year's Changes.

It is a significant fact that interest in the report of the contest committee of the Automobile Club of America centres on the cup awards.

No one seems to care a rap about the certificates, whether first, second or third class. They will be accepted, of course, but no one labors under the delusion that they play any real part in the matter. The run dwarfed them. Where practically all the survivers qualified for certificates there can be no very great merit in obtaining them.

Digitized by Google

A year ago the battle for first class certificates was a fierce one.

Only 20 cars were awarded them, and it was considered remarkable that there should have been so many to fulfil the requirements necessary to qualify for them. Twelve miles an hour was then, as now, all that was necessary, but those on the run well remember what a terrible struggle it was to average this figure. The combination of vile roads and bad weather had something to do with it, of course, but there would have been enough to struggle against under ordinary circumstances.

It is notorious that in the run which came to an end last week it was the easiest matter imaginable to average such a speed that certificates would be qualified for. So easy was it, in fact, that many operators, their sheet having been marred by one or more stops, lost nearly all interest in their own work and watched that of their more fortunate rivals. The chances of their finishing without a stop were discussed at length.

Such a change can mean but one thing—a marvellous improvement in both design and construction.

In the face of it, few can doubt that the practical motor vehicle, the kind that can be depended upon to get there and get back, is really with us at last.

Little Things That Trouble.

There were more than a reasonable number of mishaps due to ignition troubles in the reliability contest which came to an end last week.

As a rule they interfered but little with the average speed of the cars, because it was possible to put them to rights in a very short time and thus enable the car to proceed on its way. One of the objects sought by the contestants, the securing of a first class certificate, was therefore rarely balked by this cause.

But the aspirants for non-stop records—perfect scores, in other words—could lay no such unction to their hearts.

Delays of any kind wrought havoc with their plans, and it made little difference whether it was a broken shaft or a fouled sparking plug, whether the stop consumed half a day or half a minute; the result was identical in each case, and meant failure.

The matter was made more aggravated by the fact that no care or foresight seemed to avail to guard absolutely against such troubles.

One operator on the run said that at both morning and noon stops he made it a point to carefully examine his sparking plugs, connections, etc., not because he expected to find anything wrong, but to make certain that nothing was wrong.

Nevertheless, when the return journey was well advanced this same operator's car came to a stop on account of a dirty spark plug, and spoiled a record that up to that point had been perfect. It was put to rights almost instantly and the journey resumed, but the damage had been done and it was irreparable.

Such happenings as these do not impugn the reliability of the cars that are subject to them. But they are annoying, and it is a reflection on those concerned that they cannot be put a stop to or at least reduced to a minimum.

Would Prove of Benefit.

Now that the chief event of the season has been brought to a successful conclusion, and future events are being talked of, it is timely to call attention to the fact that brake tests, such as have been conducted abroad, have never even been spoken of in connection with events here.

It is true that in any road test, such as that of last week, the efficiency or non-efficiency of the brakes must inevitably be demonstrated.

It is extremely unlikely that any car could go through with credit if there was anything wrong in this respect. Luck might favor it for awhile, but over such hills as marked the greater part of the distance in the reliability contest, for example, luck alone could not account for a car's immunity from accident or mishap. The streak would be broken sooner or later, and the deficiency stand plainly revealed.

But there can scarcely be any denial of the assertion that a braking contest would bring all this out more plainly and more quickly than anything else.

That all cars are suitably equipped in this respect it would be idle to contend.

But it is otherwise with the great majority, and a demonstration of this fact would be an undoubted benefit, as well as afford some interesting observations.

Automobilists' Favorite Month.

So far this autumn the motor vehicle enthusiast has not had occasion to complain of one of his chief enemies—dust.

As he is hard to suit, however, he has not failed to uplift his voice in denunciation of the contrary state of affairs—the too general prevalence of rainy days and muddy roads.

It looks, however, as if, with the departure of the equinoctial, we are to experience a change for the better.

During the greater part of the present month bright days, clear skies and a grateful sun are, with reason, expected to be the rule and not the exception. They go to make October the best month of an unusually fine season of the year.

With such ideal weather, and the roads at their best, it is small wonder that the automobilist regards the month which ends with Hallow'een with particular favor.

The time is approaching when low temperatures will prevail and owners of gasolene cars will be disagreeably reminded of the fact that water cooling systems are vulnerable points that must be looked after carefully if damage would be avoided. The long immunity enjoyed will make it all the harder to cope with the matter. The placing of non-freezing mixtures in the water tanks, the constant care to drain tanks, pipes, cocks, etc., of the last vestiges of water when the car is put away for the night—all have been omitted during the many months of fine weather. But they will have to receive attention again, and it will be the part of wisdom to make preparations in ample time. The alternative will be damage such as cannot always be repaied readily.

There was a time when no one could ride, drive or ride in an automobile without wearing at least an automobile cap, and, if he wanted to be comme il faut, he added a leather coat and gloves, and perhaps leather breeches and leggins. Without this insignia of his vocation, or avocation, he was undone. But times have changed, and with it automobile costume. Leather garments have been to a considerable extent relegated to the professonal automobilists, and the same may be said, to a somewhat less degree, of the regulation automobile caps.

Many otherwise provident automobilists, who never think of starting out on an extended run without a generous supply of tools, supplies and parts, omit to take a lifting jack along. Yet, as every one knows, this useful little article is frequently needed, and needed badly. It takes up but little room, and its weight—and even that is not excessive—is really a small matter when it is remembered how much a modern car and its impedimenta scale down. Will the time ever come when this curious remissness is corrected?

'BUS LINES BURST

Although Money-Makers two Such Enterprises Fail in Manila—Opportunites That Offer.

Manila, P. I., Aug. 27.—Although an automobile 'bus service should prove in the nature of a gold mine in this place, the two attempts in that direction has failed unaccountably.

In March of last year a company with $50,000 Mexican currency (on paper) was organized to operate an auto 'bus service, and some of those interested in August of last year ordered two American steam wagonettes, capable of carrying twelve persons. The vehicles did not arrive here until eight months after the order was placed. When set up and placed on the street, to the surprise of the promoters they found that the machines had been tested before leaving the States and that all the water had been left in the regulators. As a result the regulators and many of the pipes were full of rust and the wagonettes were in no condition to perform their duties, the immediate result being one burned out boiler. After being cleaned and rearranged they gave fair satisfaction, and the 'bus line was operated for 23 days, and was making at the rate of more than 50 per cent on the investment, besides leaving a good margin for repairs and reserve, when the bottom dropped out of the company.

Soon after another company was organized for the same purpose, and ordered fourteen of the same wagonettes. After placing the order, however, the courage of these people oozed out, and when the machines arrived they were left on the dock and only recently were returned to San Francisco.

Although, as stated, there is no place in the world where a properly financed company would earn such large dividends, the lack of capital in this place sets the opportunity at naught. The price of gasolene is also a discouraging factor. It costs here about 45 cents, gold, a gallon. If petroleum could be used it would reduce the expense by more than one-third.

The automobile business in this country is very limited. A few French machines have been sold. There are also four American steam carriages in town. Tobias Wright, who was one of the first to become interested in the subject, and who was treasurer of the original 'bus line, has imported parts for a heavy runabout and is experimenting with the view of assembling carriages here, as he states that it is his experience that none of the motor vehicles that come to this country are suited to its roads. He believes, however, that the islands will prove a great field for automobiles, if a serviceable machine can be sold here for $1,500 Mexican, or, say, $750 gold. He bases his opinion on the fact that a good horse costs about $150 gold, and a good carriage $400, and the saving in food for the horse and care and up keep of harness and carriage would make the automobile a really economical vehicle.

The speed limit in Manila is eight miles an hour. This, however, was the limit before there was a motor vehicle within 10,000 miles of the island.

The Price of Oldsmobiles.

Asked if there was any probability of an increase in the price of the Oldsmobile, as had been rumored, W. C. Morley, of the Olds Motor Works, said:

"While I can fully understand why such an idea got abroad, I do not at this time care to give a definite expression of opinion.

"The large and rapidly increasing demand for the Oldsmobile certainly keeps our facilities for producing them at the utmost tension, and we are facing conditions never before known in America. The tremendous demand on all sides for iron, steel, rubber and all the other materials which enter into the manufacture of automobiles, the severity of the coal strike, the scarcity of skilled labor, combined with the call for the Oldsmobile, would fairly justify a sharp advance in price. But inasmuch as we have discounted all these factors in advance, we are not being affected so largely by these as would be expected. As the pioneer motor runabout, adaptable to the desires and requirements of all classes, the Oldsmobile is bound to be in still greater demand, and the very force of this demand would fully justify an increase in price; but just at present we are not ready to make it."

Sailing Under False Colors.

A person representing himself to be Ernest Cordingley of the Motor Car Journal, London, recently called at the Motor World offices. Charles Cordingley of the first named journal writes stating that there is no such person as Ernest Cordingley, and that he has no relative in the United States. The person referred to, he says, is an imposter.

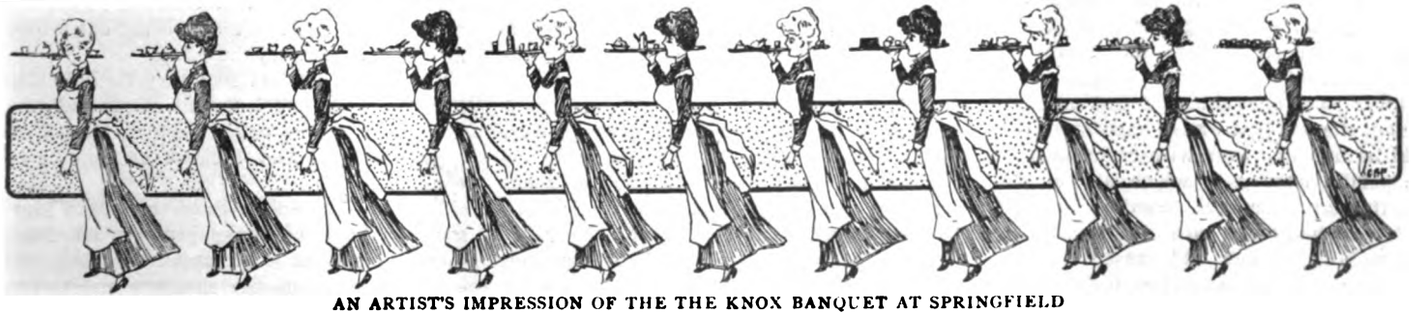
NO SPACE CHARGES

Other Favoring Conditions for Exhibitors at St. Louis's World's Fair.

Every effort is being made to have a showing of automobiles at the St. Louis World's Fair commensurate with the importance the industry has assumed. Offices of the exposition will shortly be established in this city, and the work will be prosecuted still more vigorously.

No charge for space will be made. The automobile exhibits will be housed in the Transportation Building, which covers an area of 16 acres, is centrally located and is, architecturally, by far the most attractive building in the exposition.

The foreign governments will be given a lump space in the department of transportation exhibits, which will be filled by their locomotives, cars, railway material, vessels, carriages and automobiles. The automobile section will be kept together as far as possible, and the exhibit of the United States automobile manufacturers will not be separated, and it is hoped to be able to arrange the space so that it will connect directly with the exhibit of similar manufacturers from other countries.



A large number of applications from auto-West, has been received, and A. C. Baker, assistant chief of the transportation department, in a letter to the National Association of Automobile Manufacturers, says that a magnificent exhibit from France is expected.

Applications for space must be made to the department of transportation exhibits.

Exhibitors will receive a reasonable amount of electrical power for lighting purposes free. For a special lighting, such as signs, etc., a pro rata charge will be made.

Changed the Sign.

From "automobiles not admitted" to "automobiles repaired" is a far cry, and one well calculated to cause confusion. The change has made no end or trouble for J. L. Kernochan, a wealthy member of the Hempstead, Long Island, colony, whose antipathy to the automobile is well known. At the entrance to his place, The Meadows, a sign bearing the first inscription was placed. Some wag altered it by changing "not admitted" to "repaired," and since then automobilists have made the lives of Mr. Kernochan's people miserable by applying for help.

AN ARTIST'S IMPRESSION OF THE THE KNOX BANQUET AT SPRINGFIELD

REPORTING THE RUN

How it was Planned, and the Difficulties Encountered—Clam-like Observers—Trouble With the Checkers, and the Remedy.

"It may be thought that reporting an event like that of the reliability contest last week is easy and that the reporters had a sinecure, but let me tell you that they had no bed of roses to repose on. As one of the Motor World news getters I wish to dispel any such illusion.

"I had been through the ordeal before, and I knew pretty well what was in store when I started out from the Plaza on that beautiful Thursday morning. It was not to be all fun. There was work ahead of us, work in great, big chunks.

"In evolving an elaborate system of espionage—as some of the drivers did not hesitate to call it—whereby its observers were to keep a complete record of the work of their cars, the Contest Committee wrought admirably. But they did not make our work easier. In fact, they increased it threefold. No official information being given out during the run, we were obliged to obtain unofficial information for ourselves. There were a thousand and one points—almost—to cover, and until we got things systematized chaos reigned. It was as if a heterogeneous collection of matter was poured into a hopper, there to undergo many changes, and finally to come out at the small end of the machine, refined as to quality and shrunken as to quantity.

"The methods we employed throughout the run were very simple. Starting after all or nearly all of the cars had been sent on their journey, the next control station was headed for by the Motor World car and if possible reached in advance of the contesting vehicles. En route everything of interest was picked up, particularly stoppages of any description.

"At the controls themselves the effort was made to glean from the operators and observers particulars of interest relating to their run. This was no easy matter in the hurry and scurry that invariably occurred when the stopping place was reached. But we did the best we could, and had to be satisfied with that. After the close of the night control we obtained from the checkers a list of the arrivals and departures during the day.

"The carrying out of the programme was not as easy as the making. At Norwalk and at New Haven on the first day there was manifest some disinclination to talk, or if the interviewed ones talked it was on every topic but the one that was so important. One would be bubbling over with enthusiasm at the splendid manner in which his car had come through. Another bewailed the fact that his car had 'gone back' on him in some unaccountable manner and caused a delay; but when asked for particulars instantly became close mouthed. A third class would unblushingly assign tire troubles or other equally absurd cause for a stop that we may have witnessed ourselves.

"For the first two days, however, we had little to complain of, either from the occupants of the cars or the checkers, timers, etc. By dint of sticking to it and 'jollying' occasionally we got along all right."

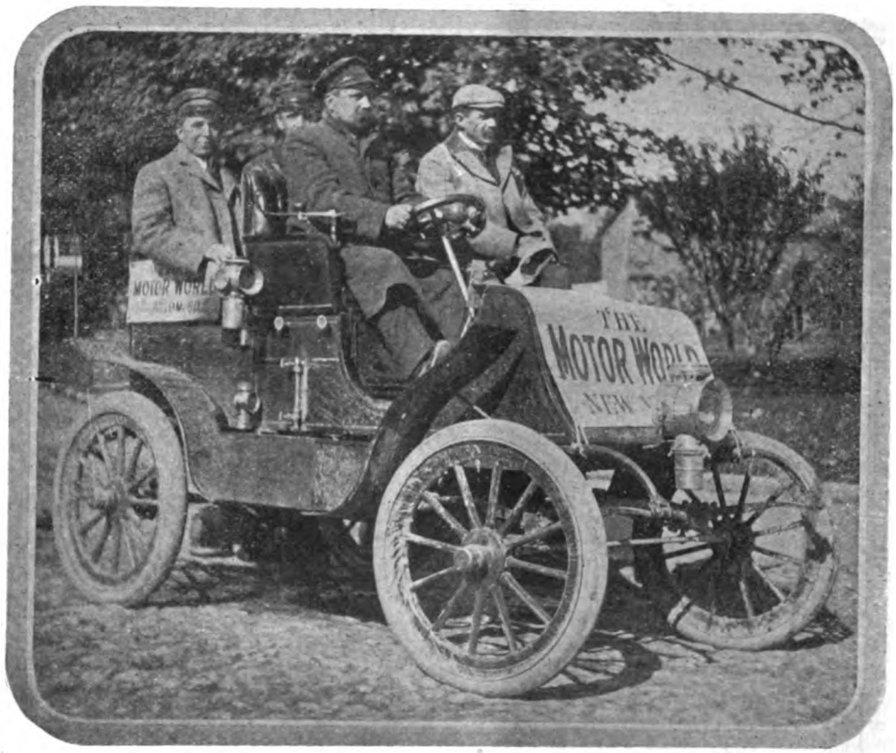
"At some places brazen and yet amusing 'jollies' would be given us. East of Springfield we approached a car stopped by the roadside. Notebook and pencil in hand I insinuatingly asked what the trouble was. The operator had been delving into the bowels of the engine, while the observer had his hands full of tools, more of which were scattered around promiscuously.

"'Tire trouble,' was the laconic reply of the loyal observer as he pointed to a cover which was leaned against one of the wheels in a suspiciously ostentatious manner.

"'Yes, tire trouble; can't you see for yourself?' said the operator belligerently, yet with a sly air. 'Just got it pumped up.'

"Plainly there would be 'nothing doing' while I was there, so I gave the word to our chauffeur and we moved on.

"The third day, Saturday, which we expected to yield us the most results in the way of roadside incidents, proved to be singularly barren of them. The run was long, and the roads, or most of them, were bad. Yet few stranded vehicles were encountered. Near Spencer F. A. La Roche was met, and to my question he replied that he had trouble with his piston. Near the same place we came across Dr. Hovestadt and his De Dion, with a couple of broken steering knuckles. The car was partly hidden from sight, and I did not take it to be in the run, and as we were in a hurry to get to the front we did not stop. Afterward I learned that it was the doctor.



"We got to Foster Hill too late to see the grand mixup there, but just east of that point, where we stopped for water, we heard all about it from the townspeople. They were proud of their hill and the trouble it had caused.

"As we neared Boston we worked our way to the front, but the oncoming darkness and the lack of incident fooled us again. There was a long line of slowly moving cars, slipping and sliding on the mud and stones of Massachusetts and Columbus avenues; but little to interest us.

"With the run half over and all the newness worn off, our labors were considerably lightened. We got our reports of arrivals and departures at controls without trouble, together with such verbal reports as we were able to extract from the observers or operators. The cars that had dropped out, and the cause of that action, were known—all except No. 69. That had gone wrong somewhere west of Worcester; not until the very end of the run did it come out where and why it gave up the ghost.

"At Boston we lost Secretary Butler's able lieutenant, the efficient and accommodating Thayer, who was called back to New York unexpectedly. And because of that came trouble.

"It began at Worcester on the return journey. Perhaps we newspaper men asked too many questions. At any rate, the red capped gentlemen—the checkers and timers

THE MOTOR WORLD CAR IN THE RELIABILITY CONTEST.

Digitized by Google

—thought so. At Worcester they were frank enough to tell us so, and asserted that we interfered with them and their work. The charge was denied, of course, but the denial did not seem to carry the weight it should. A few remarks, not exactly of a complimentary nature, were exchanged and then the incident closed.

"At Springfield that night I went over to the Cooley House at about 11:15 to get my daily table of arrivals and departures at the controls. Finding no one there, I went to the Worthy, where the Stevens-Duryea smoker was just beginning.

"By good fortune I located W. M. Turner, who was acting in Thayer's place, and to him I made known my trouble. He hadn't the sheets, but he would get them for me. After waiting about fifteen minutes I went in search of him. He was conversing with some of the other checkers as I came up.

"'Oh, yes, you want the sheets,' he exclaimed. 'Which ones are they?'

"I modestly replied that I wanted all four for that day.

"'Now, let me see. Here are the departures from Boston; that is one. Who has the others?'

"Inquiry developed that they were at the Cooley House, and thither I wended my way in company with a very obliging checker, who confided to me his opinion that an effort was being made to put work on him that did not belong there. The Cooley House was reached and one more sheet procured—that of the arrivals at Springfield—but no others. Word was sent over to the Worthy and Checker Weir appeared.

"'Why, you only wanted these two sheets!' he exclaimed in surprise.

"I assured him that the contrary was the case; that I wanted all four; that I had stated so very plainly, and that I must have them that night. In this, however, I was mistaken.

"'We will get them for you in the morning,' resumed Checker Weir. 'That is the best we can do. The sheets are around somewhere, but I don't know where and can't find out now.'

"By this time it was 1 o'clock in the morning, and this check was the last straw. In my wrath I invoked the majesty of the press, and particularly of the Motor World, and dwelt upon the importance of getting those reports off that night. As this produced no effect, I exclaimed that I was entitled to the information, and that I would have it or report the matter in the morning, lamenting, parenthetically, the absence of Thayer, under whose administration there had never been any trouble. This did seem to arouse my listener. He informed me in round terms that if I 'kicked' less I would get more, and added that it was not compulsory to give me the figures wanted.

"Of course, that ended it for that night. I went without the sheets and swallowed my wrath as best I might.

"But the next day I went to Secretary Butler and was informed that I was entitled to the figures, and he would see that I got them thereafter. Sure enough, Checker Turner took pains at New Haven to assure the newspaper men that he would have the sheets at the Tontine at a certain hour, and any one who wished could make a copy. This promise was kept to the letter.

"Perhaps it was because our Motor World car had become so well known, added to the fact that pretty nearly everybody had become sophisticated, but I was unable to obtain much information on the road as the journey neared an end. Our approach was the signal for clamlike silence.

"'What's the matter?' I called to one observer as we drew near his car.

"'Nothing,' was the derisive reply, while the operator waved a monkey-wrench he had in his hand. Nor did it do any good to stop, for they just waited for us to be gone.

"Stanch, speedy and reliable was the Motor World car, which F. C. Billings, of Hartford, had kindly placed at our disposal. The car had been turned out of the famous Billings & Spencer factory, and was in every way worthy of it. With Chauffeur Johnson at the wheel, it was responsive to our slightest wish, and whether we wished to stay back and watch the ascent of a difficult hill or push on and get in ahead of the first car it was always found equal to the task set it.

Space at Chicago all Sold.

It was officially announced on Tuesday that the Chicago show, which takes place from February 14 to 21, is assured of being a success and that the details of it are about settled. All the space has been sold and there will be about sixty-five exhibitors. The spaces have been laid out and alloted by the special committee appointed for that purpose and the floor plan lacks only the endorsement of the executive committee of the N. A. A. M. When that has been given the diagram will be printed.

The plan for spaces on the main floor of the Coliseum is wholly different from that of last year, with the result that 1,500 square feet of exhibition room has been gained. Last year the spaces were arranged in elliptical shape. This year they are wholly rectangular.

Big and little, the spaces total up 158. There will be three main aisles and the four biggest booths are in the geometrical centre of the floor. These four booths will each comprise eight spaces, with a total of 854 square feet. Each of them has two frontages of sixty-one feet on the main aisles and two of twenty-eight feet on cross aisles. As at present allotted, but subject to change, these principal blocks will be occupied respectively by the Electric Vehicle Company, Olds Motor Works, Locomobile Company and Ralph Temple.

These four exhibitors will be adjoined on the ends by the International Motor Car, Winton Mobile, Berg and Friedman companies, all fronting on the central aisle.

Githins Bros., Chicago, have secured the Oldsmobile agency for that city. Incidentally, the Githens Brothers Co., with $30,000 capital, has been incorporated to take over the business of Githens Bros.

CATECHISING OBSERVERS

Light on Various Matters Asked in Circular Sent out by the A. C. A.

Talk of flaws in the reports made by the observers were rife after the reliability run was completed, but was thought to be largely gossip of which no official cognizance would be taken. The second day after the finish, Friday, it became plain that there were some shortcomings to be looked into and tangles to be straightened out, for on that day the following letter was sent out to all the observers by Secretary S. M. Butler:

"It has come to the knowledge of the Contest Committee that some automobiles in the contest made detours so as to kill time on finding that they were ahead of their scheule, and also that some drivers on hills permitted their automobiles to run backwards while the motor was still going, and then went ahead. If the opertor of the vehicle on which you were an observer did either of these things, the Committee desires to know it and requests that you will answer the questions below so that they may become acquainted with the facts. Kindly reply at once in the enclosed stamped envelope.

"1. Did the driver of the automobile on which you acted as an observer kill time by making detours on finding that he was ahead of his schedule?

"2. Did the driver of the automobile on which you were an observer permit his carriage to run backwards on the hills, keeping the motor running so as to get sufficient speed to mount the hill?

"3. Did the driver at any time leave the schedule route, except at Windsor Locks, where a detour was necessary on account of the road being torn up, and between Worcester and Boston where the arrows had been taken down?"

Answers began to come in rapidly and by Monday afternoon Secretary Butler had an interesting mass of data to lay before the Contest Committee. Most of the observers answered "No," to each of the questions, but the Contest Committee is using quite a lot of information beside that obtained from answers to the circular letter, in determining the nice points of the whole affair.

Concerning the letter, Secretary Butler explained that it was merely a formal request to make sure that none of the operators overlooked such details because of misunderstanding the rules. It was not intended to call into question in any way the honest intet of the observers. It was thought—he said—that all who erred did so through not knowing. As the observers were the official representatives of the club it could not be expected that any outside criticism of their work would be considered by the Contest Committee. To do so would be stultifying the club.

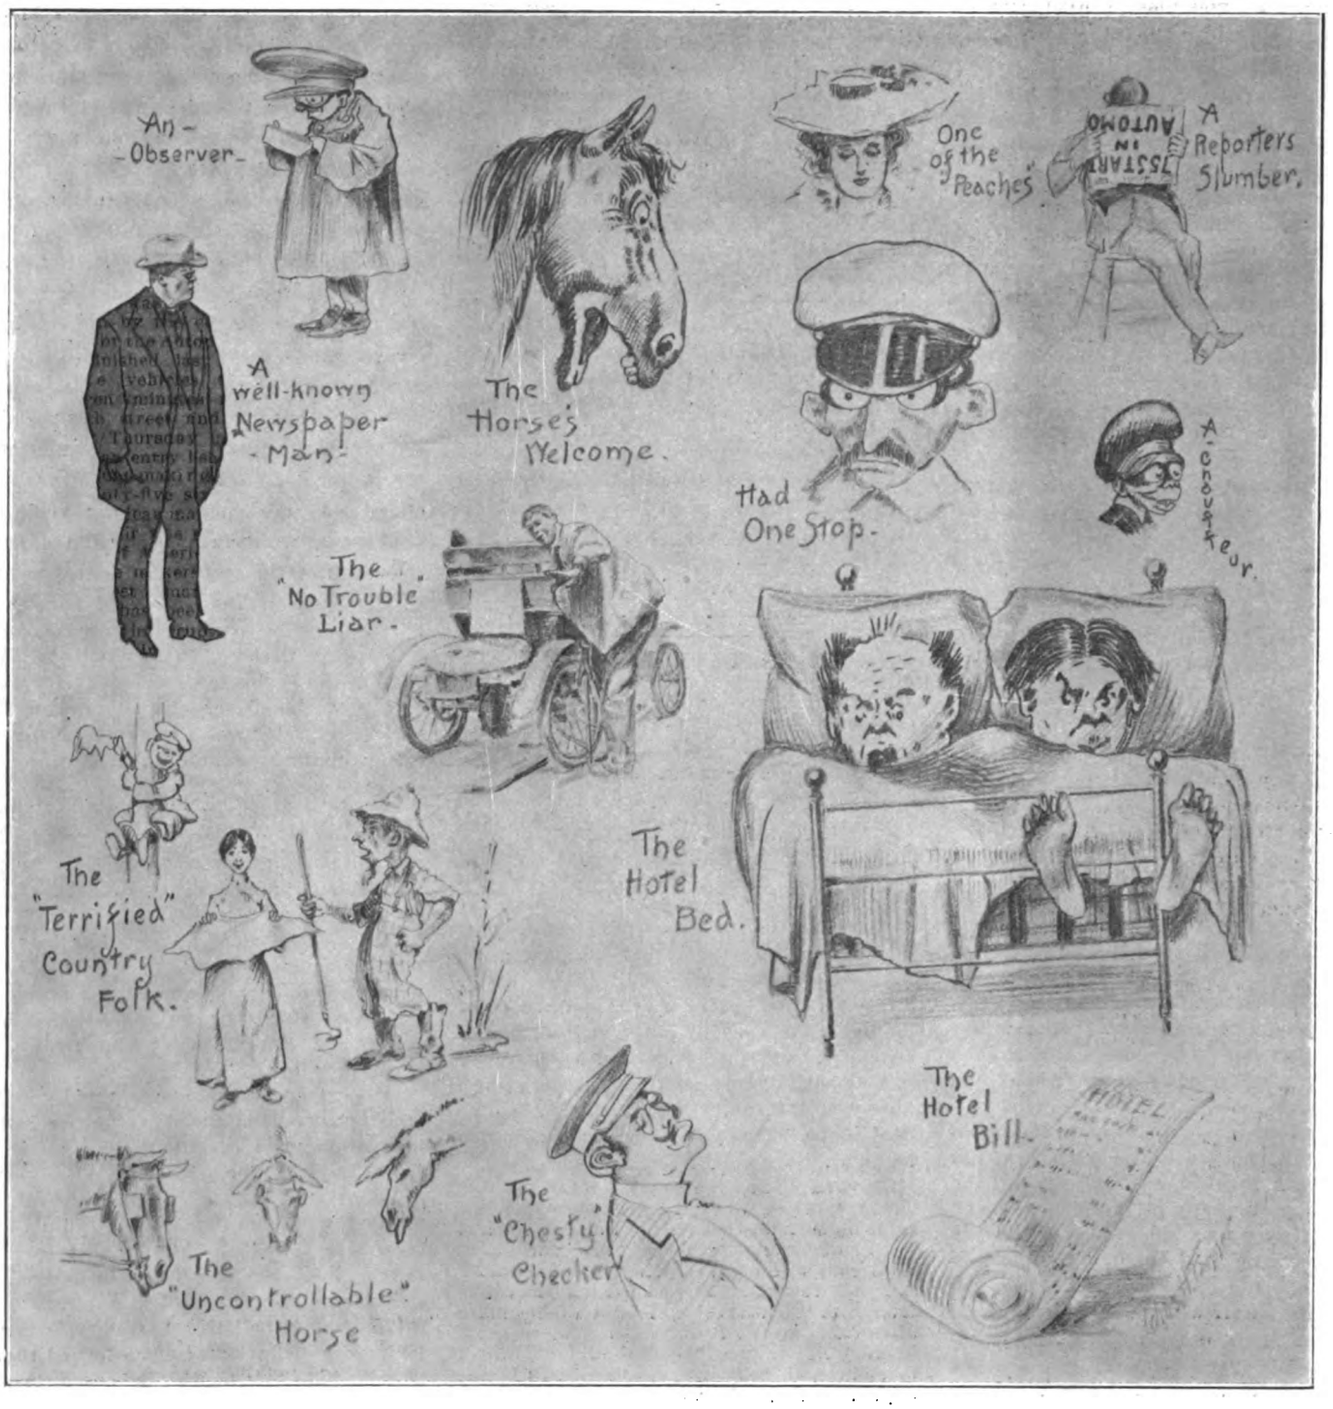
To Montreal Next Year?

Already, before the results of the 1902 contest have been made known, plans for the 1903 run are being discussed. Convinced by last week's event that a much more severe task must be set, the motor car if its real capabilities are to be brought out, Chairman Scarritt has suggested Montreal as a suitable place for the contest of next autumn.

"A journey to Montreal would not be too much of a task in view of the excellent record made by the machines on the Boston trip. True, it would be a harder trial, but the automobile must prove its stanchness in order to attain the popularity which undoubtedly is in store for it in the future," he said.



A run to the Canadian metropolis and return would give a total of about 1,400 miles, with roads of a kind that would try very thoroughly the durability of the vehicles. The route followed would parallel the Hudson River to Troy, swerve to Saratoga and go north through Fort Edward and Whitehall, and then continue along the western shores of Lake Champlain to the Canadian border.

The owner of an automobile who is looking for trouble with it can always find the trouble without any trouble.

To be Made in Cincinnati.

Plans are on foot in Cincinnati, O., to form a company to manufacture on an extensive scale automobiles like one designed and recently built by H. W. Sumner, of that city. The car, which was built for Edward Wilbern, can hardly be termed an experiment on the part of Sumner, who made several automobiles last year while in the employ of the Lunkenheimer company that showed excellent qualities in the several automobile meets that were held last fall.

It is said that Sumner has combined all the best ideas in these cars, together with suggestions gained from examining the best French autos, and also added a number of his own improvements in making this trial machine for Wilbern.

SOME IMPRESSIONS OF THE RELIABILITY CONTEST.

Short Circuits

In a recent French duel the principals and their friends went to the battleground in motor cars.

The American Storage Co., West Sixtieth street, has secured the New York agency for the Baker electric vehicles.

An agency for the sale of White steam cars has been established at 19 Prince's street, Westminster, London.

Starting from Lisbon on Sunday next the first automobile race run in Portugal will be held. The distance will be 130 miles.

The Columbus Buggy Co., Columbus, O., writes to the Motor World stating that they are not manufacturing automobiles at the present time.

A. H. Funke, the wil-known dealer in Kelecom motors, etc., has removed to 325 Broadway, this city, where he will occupy an entire floor.

At the Thirty-eighth street station of the Olds Motor Works, this city, an Oldsmobile, finished with gold, is attracting no small amount of attention.

For the fiscal year Benz & Co., the famous Mannheim (Germany) firm, have declared a dividend of 4 per cent, a decrease of just one-half from the previous year.

It is understood that the Winton Co. during the season just past sold no less than 250 of its touring cars, representing a turnover on this model of $500,000.

Within a month it is expected that the plant of the Overman Automobile Co., now at Chicopee, Mass., will be removed to Bridgeport, Conn., where it will be made a part of the Locomobile plant.

Appreciative participants in the reliability contest have subscribed to a fund which will be used to purchase a testimonial for Secretary Butler of the A. C. A. It will probably take the form of a stop watch.

Handsomely framed copies of the formal guarantee adopted recently by the National Association of Automobile Manufacturers were distributed last week to all the active members of the association, and to such of the associate members as desired them.

Automatic control through the seat is the work of an inventor who has taken out a patent on his device. When the driver of an automobile equipped with the device sits on the seat the engine starts, and when he gets up, "or is accidentally thrown therefrom," the engine is stopped and brake applied. The inventor also provides means of locking the device out of action so that the driver is not absolutely bound to run the engine when his weight is on the seat.

That pushing parts man, A. L. Dyke, St. Louis, Mo., is already in the field with his 1903 calendar. In the centre of the card appears a cut of a car made up of the Dyke No. 1 outfit, and grouped around this are about every motoriety that is on the market.

The much postponed races of the Detroit Automobile Club are set down to be run on Friday and Saturday of this week at the Grosse Pointe track. Already eyes are being cast anxiously in the direction of the sky to see if there is any moisture left there.

THREE JOLLY GOOD FELLOWS.

HARLAN W. WHIPPLE.

JOHN M. HILL. JOHN A. HILL.

Ten automobiles were brought over by the Oceanic, which came into port last week. Alfred De Cordova brought over one, John W. Gates had three cars with him, including a 45 horsepower Mercedes, and Clarence A. Postley brought over an English and a French machine.

Repentant, seemingly, for its abstinence this year, the German Automobile Club will strive to win the Bennett Cup in 1903. It is said that three Mercedes cars will be designated to make the running, and the names of Count Zborowski, M. Jenatzy and Henry Fournier are mentioned as the drivers who will probably take part.

A resort famous for its cuisine and one which had become very popular with automobilists has disappeared. This is the Denville Hotel at Denville, N. J., one of the oldest hostelries of Northern New Jersey, which was consumed by fire last Monday afternoon. On the day before a party of men well known in motor-vehicle circles were entertained at the hotel. They went there in three machines from New oYrk. The party included W. J. Stewart, chairman of the Race Committee of the Automobile Club; Percy Owen, manager of the Winton branch in New York; George B. Adams, of Adams McMurtry; A. J. Wheaton of the New Jersey Automobile Company, and Palen Nelson of New York.

Tighten up nuts carefully in order to avoid overstraining the thread. If small nuts are tightened up with a big spanner the screw is frequently sheared off. A 5-inch spanner is quite large enough to tighten up a ½-inch bolt or nut. For larger nuts add one inch of leverage to every one-eighth inch increase in the diameter of the bolt or nut.

Extra attention to side driving chains is well repaid in their running. They should be frequently removed and well washed in kerosene, dried off and immersed in a bath of melted tallow for about one hour. Keep the tallow just melted, no more. After an hour remove the chains and allow the superfluous tallow to run off.

"Tire Economy" is the apt title which the Goodyear Tire and Rubber Company, Akron, O., give a booklett describing their various styles of tires. Solid, cushion and pneumatic are illustrated and referred to interestingly. Illustrations of Goodyear tires fitted to the wheels of business vehicles, beer trucks, fire apparatus, etc., are also given.

With $150,000 capital, papers of incorporation were drawn up for a new automobile, transportation and transfer company, at La Crosse, Wis. The concern will maintain an automobile livery and operate from the North to the South Side to La Crescent and other suburban points, and will run every ten minutes. The capital will be $150,000. The company will begin business early in the spring.

Emery paper, which is frequently used to clean the porcelain surfaces of sparking plugs, has the disadvantage of scratching the surface, which then collects and holds dirt more readily. A better method is said to be to brush the end of the porcelain with hydrochloric acid and then wash it with water, which process is said to restore the surface perfectly. The acid may be obtained at any drug store.

A handsome new Rocket-Schneider of the latest tonneau pattern was imported last week by Albert Heidelbach of New York, and stored at the Barry & Hayes garage, 35 East Fifty-eighth street. It was taken out for the first time Wednesday by Mr. Heidelbach's chauffeur, Rudolph Meyer, who was in the car with James Matthews, who was killed by his car plunging over an embankment in New Jersey recently. Meyer jumped out of the Mathews car just before it plunged. The new Rocket-Schneider has a four-cylinder engine of 16 indicated horse power.

THE CASUALTIES OF THE WEEK

RAILROADS {Killed, 105. Injured, 109. **TROLLEYS** {Killed, 13. Injured, 90. **HORSES** {Killed, 5. Injured, 106. **BICYCLES** {Killed, 0. Injured, 24. **AUTOMOBILES** {Killed, 0. Injured, 2.

TOTAL, THIS WEEK: KILLED, 123; INJURED, 331. TOTAL, FOUR WEEKS: KILLED, 375; INJURED, 801.

PRIOR TO OCTOBER 14.

Corsicana, Tex.—Dennis Coughlin, killed by train.
Hawarden, Ia.—Railway collision; one injured.
Pittsfield, Mass.—Henry Newton, Jr., injured by being thrown from wagon.
Ellicottville, N. Y.—Railroad wreck; fireman killed, engineer injured.
Webster City, Ia.—Train ditched; two trainmen injured.
Fremont, Neb.—Fourteen-year-old boy injured by train.
Englewood, Kan.—Railroad wreck; trainmen injured.
Vicksburg, Miss.—Dick Andrews killed by train.
Lucas, O.—Conductor injured in railroad wreck; may die.
Tyrone, Pa.—Bertrand Young, killed by train.
Canastota, N. Y.—Warren Hatmaker, killed by train
Birmingham, Ala.—L. P. Porter, probably fatally injured by train.
Bean Lake, Mo.—Manney Downey, killed by train.
Harlem, Kan.—Four trainmen injured in collision.
Hulton, N. Y.—Thomas Stewart, killed by train.
Spokane, Wash.—Charles Anderson, cyclist, killed by train.
Omaha, Neb.—C. C. King, injured in runaway accident.
Manning, Wis.—Robert Hodgen, injured by train.
St. Louis, Mo.—Three injured in collision of trolley and wagon.
Memphis, Tenn.—Engineer Broughton, killed in collision.
Manito, Ill.—Collision. One dead; two injured.
Nashville, Tenn.—L. A. Cox, injured by trolley car.
Toledo, O.—Twelve-year-old boy injured by train.
St. Joseph, Mo.—F. M. Cropp, injured by train.
Bristol, Tenn.—James Crockett, Sr., killed by train.
Far Rockaway, N. Y.—William Kaiser (6) run over by bicycle; scalp wound.
Big Rapids, Mich.—Alexander Young (12) seriously injured in runaway.
Lester, Wash.—Railroad wreck; Engineer Mischo killed; fireman injured.
Wilson, N. C.—Little boy seriously injured by bicycle.
Seguin, Tex.—Negro injured in railroad wreck.
El Paso, Tex.—Antonio Martinez, killed by train.
Gardner, Ill.—Reece W. Beam, killed by train.
San Rafael, Cal.—Tunnel caved in on work train; one dead, one dying, and several injured.
Fitchburg, Mass.—Luther Jackson, injured by train.
Indianapolis, Ind.—Fred Ward, cyclist, injured by car.
Lawrence, Mass.—Jennie Knowles (3) injured by wagon.
Gloucester, Mass.—Allan Parsons, struck by horse.
Lynn, Mass.—Jennie Rousseau (4) run over by wagon; died.
Brockton, Mass.—Two injured in runaway accident.
Olneyville, R. I.—One injured in runaway.
Hoosick Junction, Vt.—Isaac Madison, killed by train.
Olean, N. Y.—Collision; three injured.
Syracuse, N. Y.—John Conway, injured by train.
Buffalo, N. Y.—Olive Shenk (9) injured by car.
Menominee, Mich.—Man killed by train.
Cleveland, O.—Theo. Vatilo, injured by train; may die.
Norwich, N. Y.—Miss May Evans, thrown out of carriage and injured by collision with heavy wagon.
Merchantville, N. J.—John Reed, killed by train.
Manchester, N. H.—James Grady, injured by bicyclists.
South Harpswill, Me.—Lydia Stover (10) injured by wagon.
Randolph, Vt.—A. J. Kelly injured by bicycle.
Plymouth, Mass.—Miss Holmes, injured by train.
Weymouth, Mass.—Henry Cleary, injured by train.
W. Newton, Mass.—Edmund Huston, cyclist, injured by cab.
Haverhill, Mass.—Arthur C. Fuller, injured by train.
Lafayette, Ind.—Thomas Ryan, killed by train.
Rochester N. Y.—Wm. V. Punch, killed by train.
Tamaqua, Pa.—Harry Davis, killed by train.
Worcester, Mass.—John O'Donnell, injured by trolley; may die.
Toronto, Ont.—Wreck; two trainmen injured.
Chicago, Ill.—Michael Hartman, probably fatally injured by cable car.
Conlin, Mont.—Train ditched; two or three injured.
Ouray, Col.—Wreck; one killed; two injured.
Morrisburg, Ont.—Edw. Gibbons, killed by fall from wagon.
Detroit, Mich.—Adolph Baker, injured by car.
Fall River, Mass.—Mary Marcotte (9), killed by train.
Pittsburg, Pa.— Charles K. Bryce, seriously injured by train.
Chariton, Ia.—George Wilson (9), seriously injured by train.
St. Louis, Mo.—Willie Nolan (12), killed by trolley car.
St. Louis, Mo.—Mrs. Mary McLelland, injured by wagon.
Zanesville, O.—Jas. E. Robinson, killed by train.
Seattle, Wash.—John Parson, injured by trolley car.
Atlanta, Ga.—Two injured in collision of carriage and car.
Sonora, O.—John Crowly, injured by train; may die.
Soringfield, Ill.—Samuel George, killed by train.
Toledo, O.—Fred Mayburger, injured on railroad; may die.
Brenham, Tex.—Miss Minnie Nolte, seriously injured in runaway.
Wagoner, Indian Ter.—Two injured in railroad wreck.
New Orleans, La.—Alma Blair, killed by train.
Otway, Ohio.—Ed. Montgomery killed and John Leeth fatally injured by runaway engine.
Portsmouth, O.—Two badly injured in runaway.
Indianapolis, Ind.—Collision; three injured.
Mount Vernon, Ind.—Otto Campbell (5), killed by train
Lewis Center, O.—Runaway; two injured.
Wabash, Ind.—William Hopkins, killed by train.
Cuba, Mo.—Mrs. Wm. Oliver, killed by train.
Fond du Lac, Wis.—Pat. Gannon, injured by engine.
Manito, Ill.—Fred Grover, probably fatally injured by train.
Chicago, Ill.—Martha Laeser (8), killed by ice wagon.
Evansville, Ind.—Three-year-old child fatally injured by car.
Indianapolis, Ind.—J. F. Reeder, injured by train.
Elmira, N. Y.—Runaway; three injured.
Pittsfield, Mass.—Thomas Mercur, probably fatally injured by train.
Paterson, N. J.—Collision of trolley and wagon; driver seriously injured.
Newark, N. J.—Charles Nussbaum, injured by collision with trolley.
Lowell, Mass.—Car struck truck; passenger injured.
Fall River, Mass.—Four thrown from carriage; one seriously injured.
Worcester, Mass.—Thomas McGillicuddy, injured by being thrown from wagon.
Haddam, Conn.—Frank Platt, killed by train.
Providence, R. I.—Edward Kennedy, injured by train.
Providence, R. I.—Trolley struck ash cart; driver injured.
Bowling Green, O.—Runaway; one injured.
Franklinville, Pa.—Salvatore Galelo, killed by train.
Providence, R. I.—J. W. Ross, injured by trolley striking his carriage.
Everett, Wash.—John Robinson, killed by train.
Rome, Ga.—Mrs. W. A. Dodge, seriously injured by fall from trolley.
New Castle, Pa.—J. G. Moore, perhaps fatally injured in runaway.
W. Hoboken, N. J.—Four injured in runaway.
Altoona, Pa.—Wm. J. Smith and Thos. Watson killed in railroad yard.
Conway, Pa.—James Slack, killed by train
Mifflin, Pa.—Collision; C. B. Rich killed; five injured.
Pittsburg, Pa.—Francis Broderick (7), seriously injured by engine.
Sharon, Pa.—David Adams, badly injured by car.
Natrona, Pa.—A. Mann, killed by train.
Savannah, Ga.—L. M. Laramore, killed by engine.
Savannah, Ga.—Edward Tison, fell from horse; broken leg.
Savannah, Ga.—Runaway; three injured.
Birmingham, Ala.—Two injured in runaway.
Sherman, Tex.—Leon Anderson, killed by train.
Glasgow, Ky.—S. H. Waller, injured in runaway.
Prairie Plains, Tenn.—H. House, injured by fall from horse.
Chickamauga, O.—Robert Waddell, injured by colt.
Keokuk, Ia.—Helen Browning (18 months), killed by trolley.
Centerville, Ia.—Three trainmen injured in wreck.
Mulliken, Mich.—Cornelius Wallington, perhaps fatally injured by train.
Richmond, Va.—Two injured in trolley accident.
Spencer, Mass.—John E. O'Donnell, killed by trolley.
Marquette, Mich.—Howard Osgood, killed by train.
Bridgeport, Pa.—Two injured in trolley accident.
Vanclevesville, W. Va.—Clarence Macaboy, killed by engine.
Pittsburg, Pa.—Conductor injured in trolley collision.
Ballville, O.—Ambrose Flint, hurt in runaway.
Kenton, O.—Dr. W. H. Gage, cyclist, injured by wagon.
Sandusky, O.—Samuel F. Newman, killed by engine.
Cleveland, O.—Wm. Pytel, injured in runaway.
Columbus, Ind.—Three injured in runaway.
Goshen, Ind.—H. E. Smith, cyclist, injured by colliding with team.
Lafayette, Ind.—George Braun, killed in runaway.
Rensselaer, Ind.—Joseph Devereux, injured by train.
Indianapolis, Ind.—Frank Connors, injured by train.
Indianapolis, Ind.—George Wrennick, injured by train.
Lapeer, Mich.—Two injured in collision.
Menominee, Mich.—Unknown man killed by train.
Reedsburg, Wis.—Peter Vosen (10), fell from horse; may die.
Blacksburg, S. C.—Nine-year-old girl killed by train.
Johnstown, Pa.—Mrs. Marion Santaj, killed by train.
Zanesville, O.—Clyde Gildow, killed by train.
Thompson, Utah.—Three deserting soldiers killed by train.
Aurora, W. Va.—David Coulthart, knocked from engine; may die.
Chicago, Ill.—D. B. Phalen, killed by train.
Biddeford, Me.—Philip Dion, injured by fall from bicycle.
Pittsfield, Mass.—G. Baker, injured by fall from cart.
Melrose, Mass.—Elverdo Berry (4),, injured by wagon.
Tupper Lake, N. Y.—John Lajump, killed by train.
Pittsfield, Mass.—Frank Mastroluco, killed by engine.
Pawtucket, R. I.—Two-year-old boy injured by wagon.
North Adams, Mass.—Dominick Fisher, injured in runaway.
Fairport, Conn.—Daniel Ryan, killed in runaway.
Poughkeepsie, N. Y.—Mrs. Moore, injured in runaway.
Clyde, N. Y.—Carriage collision; Solomon Cushman injured.
Catskill, N. Y.—Charles Snow, killed by train.
Buffalo, N. Y.—Thomas Burns, struck by trolley car; died from injuries.
Toronto, Ont.—Mrs. Jane Cleghorn, fatally injured by car.
Hyde Park Mass.—Trolley struck wagon; Mrs. John Crosby injured.
Riverside, Mass.—H. L. Griswold, killed by train.
Springfield, Mass.—Mills E. Wilcox, injured in runaway.
Springfield, Mass.—Patrick Kelliher, injured by trolley.
Springfield, Mass.—Three killed by train.
Holyoke, Mass.—Alice Doran, injured in alighting from trolley.
Hopedale, Mass.—J. A. Boates, injured by train.

Digitized by Google

Stoughton, Mass.—Frank Healy (7), injured by horse.
Woodbury, Conn.—Mrs. S. H. Steele, injured in collision of truck and carriage.
Marlboro, Mass.—Several injured in trolley collision.
Boston, Mass.—Patrick Sherlock, cyclist, injured by runaway horse.
Seymour, Conn.—S. W. Buckingham, injured in wagon collision.
Providence, R. I.—M. W. Overton, injured by moving van.
Pawtucket, R. I.—Car collided with wagon; Thomas Badley injured.
Van Buren, N. Y.—Unknown man killed.
Albany, N. Y.—Car struck wagon; William Foster injured.
Buffalo, N. Y.—Joseph Rupp, killed by car striking wagon.
Green Island, N. Y.—John Molloy, killed by engine.
Glens Falls, N. Y.—Bicycle collision; Clifford Poutre injured.
Rahway, N. J.—Morris Barney, fatally injured by train.
Hawthorne, N. J.—Thomas O'Neill, killed by train.
New York.—Alexander Savage, injured in runaway.
So. Coventry, Conn.—Thomas Mullen, killed by train.
Hackensack, N. J.—James Gilkinson, injured by fall from train.
Camden, N. J.—Samuel Behrman, fataaly injured, and Charles Young hurt while riding on top of train.
Wilmington, Del.—Alexander Bordley, killed by train.
Lancaster, Pa.—Thomas Ryan, killed by train.
Carlisle, Pa.—James Jackson, injured by horse.
York, Pa.—Gottlieb Waldmeyer, killed by train.
Chester, Pa.—Car struck wagon; Joseph Cooper injured.
Van Enman, Pa.—Four killed, one injured in wreck.
Coatesville, Pa.—Boy injured by wagon.
Johnstown, Pa.—Three injured in runaway.
Pittsburg, Pa.—Thos. Stewart, killed by train.
Stroudsburg, Pa.—Wilbur Fletcher, injured by train.
West Bellevue, Pa.—John Wilson, killed by train.
Augusta, Ga.—J. A. Henry, cyclist, injured by buggy.
Rochester, N. Y.—B. J. Fitzsimmons, injured by fall from bicycle.
Rochester, N. Y.—Miss Florence Ades, injured by fall from bicycle.
Waynesboro Junction, W. Va.—Samuel F. Wilkinson, killed by engine.
Baltimore, O.—Chas. C. Johnson, struck by train; may die.
Geneva, Ont.—Margaret Gallagher (7), perhaps fatally injured by trolley.
Chicago, Ill.—Frederick W. Coan, killed by car.
New Bedford, Mass.—Trolley struck wagon; John B. Gilnot injured.
Elizabeth, N. J.—Car struck wagon; Mr. Meyer injured.
Amesbury, Mass.—Trolley accident; several injured, one seriously.
Concord, N. H.—Orrin T. Sargent, killed on train.
Nashua, N. H.—Charles Lapham, injured by fall from bicycle.
Toronto, Ont.—Charles Crosby (15), injured by fall from wheel.
West Chester, Pa.—Chas. J. Pennock, injured by fall from carriage.
Montreal, Que.—Joseph Archambault, injured by cab.
South Byron, N. Y.—James Barr, killed by train.
Providence, R. I.—Arthur Peck, injured by fall from bicycle.
Providence, R. I.—George Shierson, injured while alighting from trolley.
Union, N. Y.—John J. O'Connell, killed by train.
New York.—Collision of trolley and horse car; Driver McCoy injured.
Youngstown, O.—Michael Hogan, killed by train.
Boston, Mass.—Two or three injured in trolley collision.
New York.—Jacob C. Van Pelt, injured by trolley.
Wilmington, Del.—John Mullin, injured by train.
Alexandria, Ind.—Mortimer Miller and wife injured in runaway.
Trenton, N. J.—D. H. Hetherington, killed by train.
Newark, N. J.—Two injured in railroad accident.
Little Falls, N. Y.—Bartholomew Fogarty, killed by cars.
Batavia, N. Y.—Walter Greening, injured by train.
Norwalk, O.—Samuel F. Newman, killed by train.
Columbus, O.—Hazel Seeds, injured by car.
Passaic, N. J.—John Stowe, injured by fal from wheel.
Elizabeth, N. J.—E. M. Wells, injured in trolley accident.
Cleveland, O.—Ida Fried (4), killed by car.
Indianapolis, Ind.—David and Mary Mescall injured by runaway horse.
Shelton, Que.—Boy injured in runaway.
Buffalo, N. Y.—Mrs. M. M. Martin, injured by trolley.
Rochester, N. Y.—Car struck carriage; Michael Grenich injured.
Pittsburg, Pa.—Thomas McCabe, injured by train.
Pittsburg, Pa.—Mrs. Eliza J. Shaffer, struck by trolley car.
Birmingham, Ala.—D. Y. Lowe, crushed to death between cars.
Rochester, N. Y.—Michael Tracey, injured by motor cycle.
Brandon, Vt.—Three injured in runaway.
Newport, O.—Earl Tattershall (12), injured by train.
Youngstown, O.—Hammond Mumford, killed by car.
Cleveland, O.—Wm. Slavin (8), killed by trolley.
Sharon, Pa.—A. H. Stafford, perhaps fatally injured by train.
Louisville, Ky.—John Welsh (8), killed by train.
Fountain, Minn.—Floyd Case, killed in railroad wreck.
St. Louis, Mo.—Noah T. Pritchard, cyclist, injured by car.
St. Louis, Mo.—Mr. D. A. Boyd, injured while alighting from car.
Davenport, Ia.—James Metzger, injured by horse.

OCTOBER 14.

New Marlboro, Mass.—Frank Royce, injured by fall from bicycle.
Albany, N. Y.—Dominic Lanahan, injured in runaway.
Elmira, N. Y.—Clarence L. Strong, killed on railroad.
West Hoboken, N. J.—Four injured in runaway.
Oneida, N. Y.—Wm. White, killed by engine.
Chester, Pa.—Three injured in runaway.
Lebanon, Pa.—John Albright, injured by fall from wagon.
New York.—Two injured in runaway.
Youngstown, O.—Harry Patterson, injured in runaway.
Jersey City, N. J.—Mary Kivlin, injured by trolley.
Philadelphia, Pa.—Dominico Piro (9), killed by trolley.
Philadelphia, Pa.—Unknown woman killed by trolley.
New Albany, Ind.—Mr. Louis Weber, injured in runaway.
Chicago, Ill.—Jesse Richie, killed by train.
Yonkers, N. Y.—One injured in collision.
Goffstown, N. H.—Trolley struck carriage; Mrs. Mary Whipple hurt.
Fitchburg, Mass.—Harry E. Kingsbury, injured on railroad.
New York.—Unknown man killed by train.
New York.—Chas. S. Fairchild, injured by trolley.
New York.—Collision of trolley and fire truck; several passengers hurt.
Williamsburg, N. Y.—Stephen Zeuner, injured by fall from wagon.
Smithtown Branch, L. I.—Train struck carriage; C. W. Darling injured.
Middletown, Conn.—Two bicyclists injured in collision.
Olneyville, R. I.—One injured in runaway.
Providence, R. I.—Charles Peck, injured in runaway.
Newport, O.—George Shaw, injured in runaway.
Harrisburg, Pa.—Robert Smith, injured in runaway.
York, Pa.—Child injured by bicyclist.
New Bedford, Mass.—Car struck express wagon; Wm. Wilson injured.
Holyoke, Mass.—Louis Triveau, injured on railroad.
Philadelphia, Pa.—Catharine Condon, injured by trolley.
Philadelphia, Pa.—Unknown woman killed by train.
Elmira, N. Y.—Fred Herman, injured by train.

OCTOBER 15.

Providence, R. I.—George Cox (8), run over by carriage; killed.
Rochester, N. Y.—Oswald Steinwachs, injured by fall from bicycle.
Kingston, N. Y.—Conrad Erne (5), killed by flat car.
West Springfield, Mass.—Trolley struck wagon; George Taylor injured.
South Boston, Mass.—David Dillon, injured by horse.
South Boston, Mass.—Maurice Gallivan (3), injured by buggy.
South Boston, Mass.—Mary Reagan, injured by wagon.
Medford, Mass.—Lucy F. Sanderson, injured by bicyclist.
Plymouth, Wis.—Mrs. Gertrude Hennes, killed by train.
Fulton, N. Y.—Wreck; five injured.
Lexington, Ky.—Mrs. Hall, injured in collision of trolley and train.
Zanesville, O.—Guy Smith, killed by train.
Toronto, Ont.—Five-year-old boy injured by team.
Pittsfield, Mass.—Francis McGinty, injured by wagon.
Norristown, Pa.—John L. Burkert, injured by fall from carriage.
New Haven, Conn.—James G. Ward, injured by trolley.
Hartford, Conn.—James McClelland, killed by train.
Bristol, Conn.—George Warfield, injured by train.
Atlantic City, N. J.—Collision; one injured.
Blairsville, Pa.—T. B. Rager, injured by train.
Erie, Pa.—George Auffinger (4), kicked by horse.
Harrisburg, Pa.—William Harris, killed by train.
Philadelphia, Pa.—James Moore, jumped from train; died.
Cincinnati, O.—Patrick Tully, killed by train.
Reelsville, Ind.—Railroad wreck; two killed and several injured.
Chicago, Ill.—Julius Spooler, killed by train.
Davenport, Ia.—Railroad collision; one injured.
Bethlehem, Pa.—Augustus Ungerer, injured in runaway.
Red Cliff, Col.—Collision; one killed and one injured.
Buffalo, N. Y.—John Levinger, injured by train.

OCTOBER 16.

Brooklyn, N. Y.—Robert S. Darbee, thrown from trolley; seriously injured.
Waltham, Mass.—W. W. Brown, injured by fall from bicycle.
Boston, Mass.—George A. Livingstone, injured by fall from bicycle.
Hicksville, Long Island—Obadiah B. Smith, killed by train.
Northampton, Mass.—Trolley collision; motorman injured.
Jamaica Plain, Mass.—Two injured in runaway.
Pittston, Pa.—Thomas Golden, killed by engine.
Mansfield, O.—Mrs. Maffett, injured in runaway.
Lancaster, Pa.—Mrs. Mary Glacklin, injured in runaway; may die.
Allentown, Pa.—William H. Musselman, killed by train.
Merion, Pa.—Mrs. Cornman, injured by fall from carriage.
Port Jervis, N. Y.—Charles Luke, killed by train.
South Manchester, Conn.—Burdette Dickinson, injured by fall from bicycle.
New York—Automobile and trolley collision; three injured.

OCTOBER 17.

New York—Trolley collision; two injured.
Bath Beach, N. Y.—Jacob Yuengling, struck by train; may die.
Lynn, Mass—Thomas Baker, killed by train.
Corona, Long Island—Mrs. Pauline Comstock, killed by train.
Brooklyn, N. Y.—Charles Sandburg, killed by train.
Brooklyn, N. Y.—Trolley collided with flatcar; two injured.
Philadelphia, Pa.—Train struck wagon; John Cunningham injured.
Chester, Pa.—John Brown, fatally injured by trolley.
Boston, Mass.—Jacob Ferkelsky (12), injured by train.
Boston, Mass.—William Q. Bartlett, injured by fall from bicycle.

OCTOBER 18.

New York—Trolley car struck carriage; Mrs. Mabley injured.

OCTOBER 19.

West Roxbury, Mass.—W. M. Mullen, injured by fall from bicycle; may die.
Carlisle, Pa.—Six injured in trolley accident; some may die.

AUTOMOBILES.

OCTOBER 14.

South Norwalk, Conn.—Automobile collided with bicycle; cyclist slightly injured.

OCTOBER 16.

New York, N. Y.—Automobile knocked down several boys, slightly injuring one.

Consider New York-Chicago Run.

A meeting of the Executive Committee of the National Association of Automobile Manufacturers was held on Tuesday. The American Charron, Girardot and Voigt Company and the Elmore Manufacturing Company were elected to membership. A proposition to co-operate with the Automobile Club of America and the Automobile Club of Chicago in holding a run from New York to Chicago resulted in the adoption of a resolution directing the secretary to inquire into the feasibility of such a run being conducted and report back on ways and means.

How his Chances Were Ruined.

"Well, I got that man in New York, and you may rest assured I shall leave him there," was the savage remark of L. D. Fisk, of Hartford, at Norwalk on Wednesday of last week.

For five and almost one-half days that keen sportsman had sped along in high spirits. A clean score was claimed by him, and the claim was supported by his observer, and he already had in anticipation one of the cups in his possession. But it was not to be. Just before reaching Norwalk on Wednesday he was obliged to stop and repair a pump which had been giving trouble.

"I told my man to fix that at New Haven last night," he exclaimed irately, "and supposed he had done so. But he preferred to go off and have a good time, with this result. Here is the week's work gone for nothing and without a particle of excuse for it. It wont' take me long to ship him when I get in."

Referred to Law Committee.

That curious Philadelphia speed ordinance—curious because it was drafted in part by automobilists—has been introduced in Select Council and referred to the law committee for consideration. As was stated last week, it places the speed of automobiles at 10 miles an hour, and provides a penalty of $25 for the first violation and a revocation of the license of the owner for a second.

Adams & McMurtry Dissolve.

On Saturday last the firm of Adams & McMurtry passed out of existence. Mr. McMurtry has not been actively connected with the concern for some little time, and it is understood that his interest has been acquired by the Ohio Automobile Company, for which the firm were agents. Mr. Adams will probably continue in charge as manager for the Ohio company.

New B & S Forgings.

Automobile forgings kept in stock are described in a new catalogue just issued by the Billings & Spencer Co., Hartford, Conn. Among them are several entirely new pieces. One of these is a steering knuckle for road wagons, No. C-370; a front axle and steering knuckle for heavy vehicles, Nos. A-252 and A-253, respectively; two styles of rear axles for heavy vehicles, Nos. A-254 and A-255, and a set of forgings consisting of a front axle, centre and perch stub, designed to go with Nos. A-252 and A-253, respectively. These and other parts manufactured by the famous firm are described and shown in detail.

The Week's Exports.

British East India—10 cases auto vehicles and material, $2,440.

British Possessons in Africa—12 cases motor vehicles and parts, $9,076.

Cuba—1 case auto vehicles, $126.

London—30 cases auto vehicles and parts, $25,647.

Lisbon—1 case auto vehicles, $976.

Has Consented to Serve Again.

Had President A. R. Shattuck of the Automobile Club of America desired a vindication of his administration he could not have discovered a better way of obtaining it than by declining, as he did, a re-election. It was then seen how difficult it would be to fill his place. Many names were suggested, but one by one they were passed by, declinations accounting for some, lack of availability for others.

In the end Mr. Shattuck was asked to rescind his decision not to accept the office again. This he has at last consented to do. The nominating committee and the membership at large received his consent with genuine pleasure, and the principal part of the committee's labors has been performed. It is practically assured that there will be no opposition to Mr. Shattuck's candidacy, a result unquestionably due to his arduous and unselfish labors for the club and automobilists in general.

ONE DAY'S SHIPMENT OF OLDSMOBILES.

Cash and Glory Both Gone.

"Well, there goes $40 in cold cash," exclaimed the driver of a car in the reliability contest ruefully as he started to examine a spark plug which proved to be defective. "The boss told me that if I captured one of those cups he would give me that sum of money. My mate was made the same offer, and here we are both out of the running. It's tough luck, I tell you," and he turned to the Motor World man for the sympathy that was not withheld.

THE

STEVENS-DURYEA

GASOLENE AUTOMOBILE

Was the First Machine to Reach the New York Control.

WE ENTERED TWO MACHINES IN THE RELIABILITY RUN AND EACH ONE ARRIVED ON TIME.

WE DEMONSTRATED THAT OUR MACHINES HAVE RELIABILITY, SPEED, AND ARE GREAT ON HILL CLIMBING.

The Entire 500 Mile Run was Made Without the Adjustment of Any Part or Addition of Water for Cooling.

They are equipped with an 8 horse-power, two-cylinder engine and start from the seat and can easily be operated by a lady. It is also noiseless. This will be the popular carriage for 1903.

WEIGHS 1050 POUNDS. PRICE, F.O.B. FACTORY, $1200.00.

WE WANT ONLY RELIABLE DEALERS FOR AGENTS. *SEND FOR OUR CATALOG.*

Broke the Record

A **Winton Touring Car,** on Oct. 15th, ran the 250 mile course between Boston and New York in the remarkable record time of less than 12 hours. The car won a perfect score and had the advantage of complete check by the control officials of the Automobile Club of America's New York-Boston-New York reliability run.

THE PERFORMANCE CLIPPED 6 HOURS FROM THE PREVIOUS BEST RECORD.

This car, owned by Mr. H. D. Corey, the well known Boston banker, had just been released from the customs after completing a several thousand miles successful tour upon the European continent. It was a 15-h. p. car with standard 1902 equipment throughout.

The new **Winton Touring Car** will have a 20-h. p. motor and many other improvements which will insure its position upon the topmost round of the automobile ladder.

NOT UTILITARIAN ONLY

But Ornamental as Well, is This Abiding Place for Motor Cars.

In contradistinction to a horse stable, an automobile house can always be made attractive. There are no sanitary devices that need to be put in for the purpose of rendering the place bearable, as there would be if horses were kept in it. Consequently its proximity to the house is an advantage rather than a drawback.

In the accompanying illusgtration it will be seen how successful the owner has been in making his "garage" ornamental as well as useful.

GARAGE WITH PERGOLA.

The first shows the veranda of the house fronting the lawn. There is a seat provided, sheltered by the roof; two barrels collect the surface water, very handy for washing purposes. The whole of the gable and the top part of the gates are of glass; the house derives further light from the window (of light green shaded glass) in the veranda and a window of similar dimensions at the opposite side of the house, so that there is no lack of light within.

The second photograph shows the interior. The size being 15 by 12 feet, there is ample room for two good sized cars, and sufficient space for a passage both in the middle and at each side.

The small door open at the left end of the house leads into a small dark room (3 by 3 feet) with a small window (18 by 10 inches) with both ordinary and red glass, to be used as occasion requires. To the right there is a repairer's bench let into the wall (7 by 1¾ feet), with all the various accessories. The dark square visible underneath the small car to the right is the cover of the pit (4½ by 2 feet by 4 feet deep. On the top there is a commodious loft (with curtain in front), holding a store of necessaries and at the same time useful as a box room.

The third photograph shows the back of the house with the window of the repair room (15½ by 8 feet) fitted up as a convenient residence for same. There still remains to mention that there is a pavement laid from the gates of the stable to the sidewalk in garden with a slight fall to the latter.

A further addition is now in course of construction in the shape of a glass covered way of 12 feet from the stable gates and along the paved way to enable washing outdoors in unfavorable weather and to afford temporary shelter to friends' cars. The roof of this covered way will rest on four wooden pillars (two on each side) sunk into the ground, and in order to conform with the garden surroundings, will be covered by plants to form a pergola.

Efficacious and Lasting.

More than a year ago a piece of road on the outskirts of a large town, some 300 superficial yards long, was sprinkled with crude petroleum, allowing one gallon to each ten superficial yards.

The season was very dry, but it was found that the one application, costing about one cent a square yard, sufficed to lay the dust, and no further sprinkling of oil or water was necessary during the whole of the summer.

TIRE CONSIDERATIONS

For Good of All Should They be Penalized in Endurance Contests?

Taken as a whole, the New York to Boston and return reliability contest, which ended in this city yesterday, showed comparatively few constructional failures that will give cause for penalty marks even in the aggregate. That this is true it is somewhat trite to say that the manufacturers are to be congratulated, as words of praise are pouring in on them from all sides.

From all reports, however, it can be counted as one of the favoring clauses of the rules that points were not counted against the participants because of tire troubles, as these seem to have been more than ordinarily frequent. The statement has been made by one who followed the matter closely that if all the stops of every kind, penalized and non-penalized, were taken into consideration, tire troubles, chiefly punctures, would show up for seventy-five per cent.

Whether these were from inherent causes or because of peculiar road conditions evidences are not clearly at hand to determine, but that there is a tendency in some quarters to use the light tires seems reasonable in consideration of a recent experience of a Motor World representative. While in a tire establishment there came a telephone call asking for the price on 3-inch tires. A return inquiry developed that the prospective buyer wanted the tires for a 1,600-pound vehicle, when he was told that four-inch tires were the smallest that the tire maker would recommend or care to supply for the vehicle in question.

It is the important feature of the incident that the prospective buyer purchased the four-inch tires, proving that tire makers and dealers have but to take the proper stand with their customers, when if too light tires are being used, and it has been our experience in two or three instances that such was the case, some tire complaints will be eliminated from the woes of the makers.

Bearing on this subject was the rule in the recent reliability trials held in England, which counted in punctures as penalties. Because of this rule those entering their vehicles generally equipped them with heavier tires than they did in the trials of the year before, with the result that tire troubles were far less frequent. It was the contention of some that tires should not be penalized, but the answer was given that vehicles had been using too small pneumatics and that the rule would prove this. Every evidence bears out the contention.

Resin Too Positive.

A greasy clutch leather should be well dressed with powdered chalk or fuller's earth. Either substance soaks up the oil and admits of a good grip being obtained. Resin on a clutch only causes it to grip fiercely, and eventually ruins the leather. The best leather dressing is cotton, or castor oil.

CLEVELAND, U. S. A.

THE FRENCH HORNS ARE THE FINEST IN THE WORLD.

No. 8 Horn.

We are importing the largest assortment and most complete line of **FRENCH HORNS** coming to this country. **No. 8** is the most popular style, with opening pointing at right angle from the bulb.

We have in stock the following sizes, in addition to list given in our Catalog.

LIST PRICES.

Number.	Total Length.	Diam. of Bell.	Metal.	Price.
8	8½	3¼	Nickel	$4.00
9	10	3½	"	4.80
10	11	4	"	5.20
11	12	5	"	6.50
13	12	5½	"	7 50

The following are straight style, the opening pointing forward from bulb.

Number.	Total Length.	Diam of Bell	Metal.	Price.
12	13	5	Brass	$6.40
14	14	5½	"	7.60
1	8	2¾	Nickel	2.75
1½	9	3⅛	"	3 00
2	10	3½	"	3 40
2½	10½	3⅞	"	3 75
3	11½	4½	"	4.40
4	12¼	5⅛	"	5.60
5	13½	5¾	"	7 00

Any of the above Horns, fitted with 4 feet Flexible Metallic Tubing, $4.00 extra. No. 4, 12¼ total length, 5⅛ diameter of bell, with 3¼ feet Flexible Metallic Tubing and Screen attached, $12.50. Brass or Nickel.

Any of the above Horns delivered to any part of the United States, charges prepaid, 25 cents extra.

Discount to the Trade. *Catalog on Request.*

THE LARGEST AUTOMOBILE SUPPLY HOUSE IN AMERICA.

CHAS. E. MILLER, MANUFACTURER, JOBBER, IMPORTER and EXPORTER

97, 99, 101 READE ST., NEW YORK CITY.

A FOSTER CLINCHER

AGAIN THE FOSTER AUTOMOBILE PROVES ITS SUPERIORITY.

Their wagon known as "B-70," won a Blue Ribbon in the New York-Buffalo Endurance Race, 1901.

This same wagon had continuous, hard usage from September, 1901, to October, 1902, and then was entered as

"B-70" in the New York-Boston Reliability Contest, and with the original boiler, engine and all vital parts, finished with 100% Reliability credit.

No other make of machine made a better record.

The Foster is a steam vehicle.

Of the automobiles that started in the big run, fifty-five were gasolene and nineteen steam. Of those that finished with clean scores, ten were steam and ten were gasolene, conclusively proving the superiority of steam as a motive power, for touring purposes.

Catalogue of Foster Automobiles sent on request.

FOSTER AUTOMOBILE MFG. COMPANY, Rochester, N. Y.

BUFFALO'S SPEED LAW

New Ordinance Strongly Supported, but is Referred to Committee—Its Provisions.

After hanging fire for a number of weeks the automobile speed ordinance now pending in the Buffalo, N. Y., councils, and indorsed gy the Buffalo Automobile Club and automobilists generally, has been again postponed. A committee of three has been appointed to look into the matter and give the subject further consideration.

The action referred to was taken last week. The proposition is to amend the city ordinances so as to permit a speed of 15 miles an hour throughout that part of the municipality beyond the business zone bounded by North and Best streets, Fillmore avenue and Buffalo River, leaving a rate of eight miles an hour inside of those boundaries. A number of the prominent citizens and business men, automobile owners and members of the Buffalo Automobile Club, attended the hearing and presented reasons why the Councilmen should not place a taboo upon the automobile, the vehicle, of the future for business and plasure, by voting down the measure which the Aldermen have already approved.

Dr. Lee H. Smith presented the appeal in behalf of the Automobile Club, in five points, as follows:

Point 1—The Common Council is authorized by the charter of the City of Buffalo to regulate the use of its streets and to declare in what manner and for what purposes they shall not be used.

Point 2—In regulating the speed of automobiles the city cannot limit the speed thereof in the built-up portions of the city to a lower rate than eight miles an hour, and in the unbuilt-up portions thereof to a lower rate of speed than 15 miles per hour.

Point 3—It is, therefore, the duty of the Common Council to define the boundaries of the built-up portion of the city, and limit the speed of automobiles therein to a rate of not less than eight miles per hour, and also limit the speed in the portion outside such built-up portion to a speed not less than 15 miles per hour.

When the change in th ordinance was suggested to the Committee on Ordinances of the Board of Aldermen a proposed ordinance was submitted to them in which the territory limiting the speed to eight miles an hour was given. After consideration the Committee on Ordinances determined that the restricted territory was not sufficiently large, and modified the territory proposed as follows:

On the north by the northerly line of Porter avenue and the northerly line of North street to the easterly line of Main street; running thence, northerly to the northerly line of Best street thence, easterly along the northerly line of Best to the easterly line of Fillmore avenue; thence, southerly alonk the easterly line of Fillmore avenue and the easterly line of Smith street to the northerly line of Buffalo River runing thence, westerly along the northerly line of Buffalo River, to the easterly line of Buffalo Harbor; running thence, northerly along the easterly line of Buffalo Harbor to its junction with Porter avenue, the place of beginning.

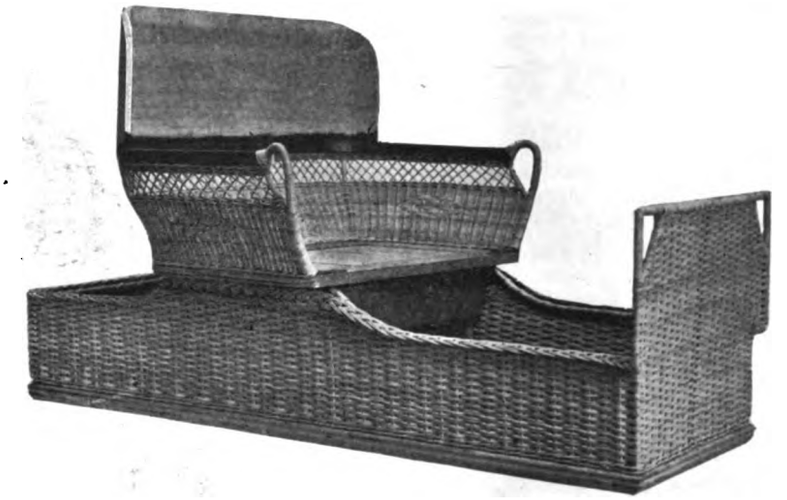
It will, therefore, be seen that the teeritory where the speed is limited to eight miles an hour, takes in all of the busiest sections of the city.

In view of this fact it should not be deemed necesary to make any further limitation of the territory in which these vehicles are limited to a speed of eight miles per hour.

Poine 4—No discrimination is sought by the automobilist in asking the enactment of this ordinance; all vehicles are treated alike.

Point 5—Under the circumstances it would seem that the request of the Buffalo Automobile Club is reasonable, and that the Board of Councilmen should approve the action of the Board of Aldermen in adopting this ordinance.

Dr. Smith supported these points with a statement in which he promised the Councilmen, on the faith of the club, not only would the members of the Automobile Club observe the regulations is so adopted, but would individually and collectively prosecute those who violated the audience. Members of the club, he said, were obliged to sign an agreement, before they were admitted, to obesrve the speed regulations and not to race upon the city streets; and two members had been expelled for violating this. The district where the speed was limited to eight miles and hour had the approbation of the Superintendent of oPlice and Corporation Counsel. He pointed out that there was only one objector at the first hearing and none on this occasion. All the automobilists desired, he said, was generous treatment, such as had been received from the aldermen.



Councilman Smith suggested that action on the proposed ordinance be postponed a week to give a committee af three an opportunity to look into the matter further.

Councilman Stoddart stated that while he was away last summer he looked into automobile regulations and found a speed limit of eight miles in Boston and 15 miles beyond the suburbs. In Philadelphia it was seven miles an hour. His investigation had not extend dto Pompeii, Herculaneum, Ninevah, Tyre and other dead cities. He said he believed the members of the Automobile Club could be trusted with an increased rate of speed, but others had to be looked after.

Councilman Fleischmann spoke in favor of increasing the rate as proposed. hTe motion to appoint a committee prevaild, howevr.

Body Made of Rattan.

The Rattan Novelty Co., of Indianapolis, Ind., manufacture many novelties in rattan for motor vehicle use, such as hampers, seats, umbrella holders, etc., in addition to the neat runabout body shown herewith.

The makers use rattan and not willow, and claim for this body that it is stronger than wood.

Soon Pay for Themselves.

Reference has been made in these columns to the extensive use made of motor vehicles by the Hartford (Conn.) Electric Light Co., and that use has demonstrated most conclusively their value.

Two years ago the rapidly increasing business of the company was drawing so heavily upon the energies of the executive department that the appointment of an assistant to the general manager was thought necessary. While looking about for the right man President Dunham conceived the idea that use of an automobile might help matters, and, as an experiment, he purchased one of the Electric Vehicle Co.'s runabouts. It was found that the machine greatly increased the scope of personal inspection of the company's work going on in different parts of the city, and the appointment of the assistant was indefinitely postponed. President Dunham says that the vehicle, which is still in commission, paid for itself in eight months.

More recently the company has purchased an additional runabout for the foreman of line construction, an electric delivery wagon and a large electric emergency wagon for general utility and "trouble business."

Attacks Constitutionality.

The conviction and fining of Harry S. Woodworth by Peace Justice C. P. Downs of Brighton, N. Y., on May 16, to the amount of $50, for alleged violation of the so-called Automobile Law, regulating the speed of horseless vehicles on the highways, which was affirmed by County Judge Sutherland at Rochester, N. Y., has started an attack upon the constitutionality of the legislation by Mr. Woodworth's counsel, Horace McGuire, who has appealed the case to the Appellate Division.

Mr. McGuire contends that Section 666 of the Penal Code discriminates unfairly and is unreasonable because it makes the incorporation of a village the test of criminal liability instead of the built-up condition of the locality. Mr. McGuire interprets the penal legislation as practically guaranteeing a person the common law right to operate an automobile at a reasonable and proper rate of speed, having regard for the traffic and use of the highway. Interference of the Penal Code with a common law right is unconstitutional.

The principal argument, though, is the discrimination of the law, making the rate of speed for automobiles eight miles an hour in incorporated villages and allowing twelve in unincirporated, although it is well known that many of the latter class are larger and more thickly settled than many incorporated villages.

Observer "Rendered Assistance."

When a man becomes "rattled" he is almost helpless. The driver of a car in the A. C. A. endurance run, was a case in point. He had everything ready for a start apparently, and went to start his engine. He could not get a spark, however. A dynamo supplies the spark, and several turns of the flywheel are necessary before the engine will start. Try as he might the operator—a little chocky built fellow—could not get it to going. He turned the handle with all his might, got red in the face and out of breath.

His observer watched him for a while in silence. Then he said: "Let me try that." He turned the crank and found that it was difficult to force around. "I believe it is because the lubricant is cold," he said. "Get a torch or something that we can warm it with."

The operator was incredulous, but finally went in search of the article wanted. It was lighted, applied to the shaft once or twice and the liquid oil began to drop out of the case.

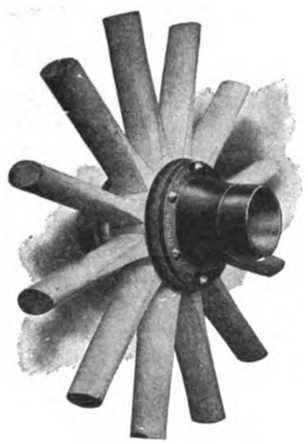
"Now try it," remarked the observer. The operator did, and the crank went round freely and easily, the needed spark came and the engine started up with right good will. The two men jumped into the car, dashed to the starting point, and were just in time to escape being late.

At the noon control the operator bought a torch and carried it along with him. Several other operators reported that they had trouble in starting, and there is little doubt that the low temperature at New Haven on Thursday night was accountable for it.

How Made and Used.

The illustrations herewith show the make-up of the wood wheels marketed by the Neustadt-Perry Co., of St. Louis Mo.

The hub has bands pressed on by hydraulic pressure, making them solid and



compact. After this operation the sleeve, or box, is inserted. The outside cap is next telescoped over this sleeve, coming out at the opposite side of hub, having bolts pass through which lock the sleeve and flange to-

gether. It is claimed that there is no possible chance for this wheel to revolve around the box, as the bolts hold the box and flange together, as they pass between every other spoke.

This wheel can be readily keyed to any axle, or adapted to revolve on the axle if the sprocket is fastened on the wheel.

Most Wonderful Claims.

Patents have been taken out in England on a motor for which extraordinary claims are made. The motor is a double acting one, and will work either as a steam or internal combustion engine. Its size and power, according to reports, are practically unlimited, as are the purposes to which it may be applied. Should this wonderful motor fulfil half the claims made for it a revolution in mechanical propulsion may be expected.

Automobile Road in Africa.

"Darkest Africa" is already being traversed in many directions by the automobile. This is shown by the fact that the Belgian colony is constructing a regular automobile road between Nsongolo and the River Kwango. The work is being done under the direction of Captain Carton.

The progressiveness of the Belgians in this respect has excited the envy of the British, and an agitation is going on among the English colonists to have similar roads constructed in the districts controlled by them. It is pointed out that roads capable of accommodating such automobile traffic as would serve to open up interiors and facilitate trade in a wonderful way could be easily and cheaply formed from local material, and, not being subject to the wear of hauling cattle and horses, which is responsible for 90 per cent of the damage done to road surfaces by traffic, would last infinitely longer than ordinary roads. In fact, for the most part, the automobile traffic would improve rather than deteriorate the road surface.

It is also suggested that a good way to secure immigration in Africa would be to have no speed limit on the roads leading to somewhere in the interior, providing, of course, automobilists are regarded as a good class of immigrants.

Globe Girdlers Reach St. Petersburg.

After suffering an eclipse of many weeks, having been last lost sight of at Berlin, the globe girdling automobilists, Dr. Lehwess and his companions have been heard from at St. Petersburg.

From Russia the party will go by way of ous run, having taken a wrong turning and spent two days toiling over ploughed fields. The car had often to be pulled out of the mud by villagers with teams of horses.

From Russia Lehwess will go by way of Siberia and Japan to the United States. Since leaving London they have travelled 2,715 miles.

The adventurers left London last February in a specially built Panhard car. The latter has sleeping quarters and provision for carrying a large quantity of food and fuel. Many troubles were encountered before the journey was well begun, and it has for a long time thought it had been abandoned.

When to Take Care.

If a leak in the gasoline tank or connection is discovered at night the lamps should be put out at once, and care taken that no light is brought near the car. If it is impossible to rectify the leak without a light, and no electric lamp or torch is available, the acetylene lamp may be lighted and placed at least four yards from the car. When the leak is stopped the escaped gasoline should be wiped away, and a few minutes should be spent in waiting for what is left to evaporate before attempting to light the lamps.

The Week's Patents.

710,938. Voltmeter Scale. Walter C. Baker, Cleveland, Ohio. Filed Feb. 15, 1902. Serial No. 94,151. (No model.)

Claim.—A voltmeter scale adapted for cooperation with the movable pointer of a voltmeter, and having thereon graduation marks, and, associated with said marks, one set of figures indicating the total voltage of the battery, and a second set of figures which indicate the voltage per cell and are respectively the figures obtained by dividing the associated figures in the first series by the number of cells in the battery.

710,953. Electric Battery. Albert J. Cook, Jersey City, N. J., assignor to the Federal Development Company, Charlestown, W. Va., a Corporation of West Virginia. Filed July 20, 1901. Serial No. 69,026. (No model.)

Claim.—1. A battery comprising an outer cell provided on its bottom with a plurality of spaced apart sets of ribs, the outer ribs of each set being spaced from the wall of said cell and combining therewith to produce an intermediate channel, an outer electrode located in said channel and partitioned into compartments agreeing in number and shape with said sets of ribs, said partitions being seated between the sets of ribs, and electrode containing caps fitting and conforming to said compartments and sets of ribs.

710,962. Pneumatic Tire. Rudolph Fleischer and Matthias Reithmair, Minden, Germany. Filed Dec. 21, 1901. Serial No. 86,798. (No model.)

Claim.—A pneumatic tire consisting of separate air tubes and distinguished from all other pneumatic tires by having a case in which flaps are cut at distances corresponding to the number of tubes, through the flap openings air tubes can be introduced by means of laces into the space within the case, which is closed by a piece of material which is laid over the flap and the thick edges of which are grasped by the rims of the felly.

710,971. Rubber Tire. Charles W. Harris, Akron, Ohio. Filed April 11, 1902. Serial No. 102,412. (No model.)

Claim.—1. In a rubber tire for vehicle wheels, the combination with the channel, the tire and independent retaining wires, of frictional fabric strips extending transversely at intervals through said tire to form rests for said retaining wires, substantially as specified.

711,005. Carbureter. George M. Schebler, Indianapolis, Ind. Filed April 21, 1902. Serial No. 103,875. (No model.)

Claim.—1. In a carbureter, the combination, with a reservoir whose shape is such that a uniform volume of liquid contained in its bottom may be defined by any one of a plurality of surface planes having substantially the same point of intersection, of a discharge nozzle communicating with the reservoir and the discharge outlet of which lies substantially at the point of intersection aforesaid, an air pipe into which the said discharge outlet of the nozzle leads, means for controlling the flow of liquid through the nozzle, and means for maintaining a substantially constant volume of liquid in the reservoir.

711,081. Vehicle Wheel Tire and Fastening. Arthur L. Stevens, New York, N. Y. Filed Jan. 9, 1902. Serial No. 88,965. (No model.)

Claim.—1. A vehicle wheel tire comprising a substantially solid elastic body and tread having inserted in its base which lies within the wheel rim channel a series of strips or layers of reinforcing fabric which are disposed certically edgewise in the general plane of the tire or wheel and are separated by inwardly extending adhering layers or strata of the body and tread of the tire and are adapted for passage through them of transvers pin or bolt fastenings applied at the base of the tire.

711,112. Steam Truck. Walter H. Knight, New York, N. Y.(assignor to Pneumatic Carriage Co., New York, N. Y., a Corporation of West Virginia. Filed Feb. 25, 1901. Serial No. 48,744. (No model.)

Claim.—1. In a motor vehicle, the combination with the truck frame and the steering wheels mounted on independent axles, pivoted to said truck frame, of two independent engines spring supported on said truck frame and having their shafts respectively in line with the pivots of said independent axles, and independentiy connected to said steering wheels through extensible connections, each consisting of sliding coupling members one of which is carried by the engine shaft and the other is mounted on the pivot of the independent axle, such driving connections comprising a power transmitting gear concentric with the pivots of the steering axles.

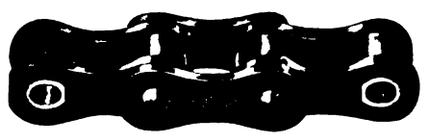
711,114. Machine Engine Oiler. George J. Kraushaar, Cleveland, Ohio. Filed Feb. 14, 1902. Serial No. 94,043. (No model.)

Claim.—1. As a new article of manufacture, an oiling can having an opening in its top and a slot at its side entering said opening and having a depressed seat about said slot and opening constructed to receive a cover, and a projection on its outer and lower portion in line with said slot constructed to be engaged by a handle, substantially as described.

711,118. Motor Vehicle. William Norris, Preston, England, assignor to T. Coulthard & Company, Limited, Preston, England. Filed Nov. 5, 1901. Serial No. 81,278. (No model.)

Claim.—1. In a compound engine, in combination, a high and a low pressure cylinder with corresponding valve chests, a cylindrical valve casing in each chest, steam ports between the casings and both ends of their respective cylinders, a hollow piston valve open at both ends within each casing, an annular space between each valve and each casing, passages in the casings forming communication between the chests and annular spaces, a hollow cover closing the back end of both cylinders, a partition dividing the hollow space of the cover into two portions one of which communicates with the interior of the high pressure valve and the other communicates with the interior of the high pressure valve, an intercepting valve chest fixed to the hollow cover, a steam passage on each side of the partition communicating with the intedcepting valve chest, an exhaust steam outlet in the low pressure valve casing in direct communication with the annular space, and means for operating the valves, substantially as described.

711,295. Lubricator. Joseph H. Deare and John M. Leckner, Detroit, Mich., assignors to American Lubricator Company, Detroit, Mich. Filed Feb. 14, 1902. Serial No. 93,994. (No model.)



Claim.—1. In a gravity feed lubricator, the combination with a reservoir, a feed tube and an adjustable plug in the upper end of said feed tube; of a valve stem within said feed tube consisting of two parts, one part being connected to the other and having a limited longitudinal movement independent thereof, independently operating springs, one to actuate each part of the valve stem, a

valve on one end of said valve stem, and a hand lever pivoted to the opposite end of the valve stem.

711,122. Accumulator. Jean B. Relin, Levallois-Perret, France. Filed Dec. 4, 1901. Serial No. 84,625. (No model.)

Claim.—1. A frame adapted to form the supporting portion of an accumulator element or plate having the side and bottom walls of triangular form in cross section and the upper portion provided with a series of steps adapted to receive the ends of downwardly depending strips, substantially as shown and described.

711,235. Gas Engine. Edward G. Shortt, Carthage, N. Y. Filed Oct. 5, 1901. Serial No. 77,706. (No model.)

Claim.—1. A gas engine having a combustion chamber having a primary exhaust to the atmosphere, a vacuum space with secondary exhaust thereto from the combination chamber, an intercepting valve controlling the primary exhaust passageway, and variable pneumatic means for seating said valve during a secondary exhaust, as set forth.

711,311. Steam Boiler. Henry K. Hess, Philadelphia, Pa. Filed June 14, 1902. Serial No. 111,756. (No model.)

Claim.—1. A steam boiler comprising a shell having lower and uppepr heads, each provided with a series of flue openings, upright hollow projections rising from the upper faces of the upper and lower heads and alined with their respective openings, flues telescoping with the projections, and a bonding metal at the junction of the flues and projections with the heads for the purpose described.

711,823. Motor for Toy Vehicles. Harry T. Kingsbury, Keene, N. H. Filed April 23, 1902. Serial No. 104,326. (No model.)

Claim.—1. A motor for toys, comprising an open bottom casing adapted to be secured to a body, a separate bottom plate for the casing, means for securing the bottom plate in position, a vertical winding shaft mounted centrally in said bottom plate, a convolute spring above said gear, secured thereto at its outer end and at its inner end connected to the winding shaft, and a wheeled axle mounted in bearings at the upper side of the bottom plate, and having a pinion in gear with said horizontal gear, the spring motor and driven parts all being removable with said bottom plate; substantially as described.

711,441. Motor Vehicle Frame. Andrew L. Riker, Shorthills, N. J., assigner to the "Locomobile" Company of America, New York, N. Y., a Corporation of West Virginia. Filed July 19, 1902. Serial No. 116,214. (No model.)

Claim.—1. A frame for motor vehicles, including angle iron side members tapering in depth or height from at or near the middle thereof toward the ends.

Evils of Premature Ignition.

In these days, when almost every gasolene car has electric ignition, there is an ever present danger from too early firing which was impossible in the old days of incandescent platinum tubes. The firing point then practically remained constant, except that a very hot lamp fired the explosion a trifle sooner than a moderately hot one. Firing before the charge had reached its maximum of compression was at any rate practically impossible. Now, to fire a charge too early in a cylinder of a diameter of 4 inches to 5 inches means a gigantic strain upon the connecting rod and the shafting.

Freddie and the Automobile.

A youth gifted with wonderful imaginative powers is Freddie Hartman, aged ten, who returned to his home in this city last week after an absence of two days, during which he underwent many exciting experiences.

"When I left home I went over to Seventh avenue," he said. "A big automobile stopped right in front of me. There was three big men inside. One of them got down and he says to me, 'Say, young man, don't you want a ride?' I told him I was going to school, and then he says, 'We'll get you to school quick,' and he grabbed me by the arm, and before I knew what he was doing he threw me right up into the seat.

"They started the machine going and kept it up all day. I bet we went through every street in New York and all the parks. One of the men had grub in a bag. It tasted good, but I wanted to go home and they wouldn't let me. When it was getting dark we went across the Brooklyn Bridge. When we came back the automobile went on a big steamboat. The men told me if I didn't keep quiet I'd get thrown overboard. They made me sleep down in a big black place, where it was all barrels and boxes, and there was a lot of 'guineas' sleeping there, too.

"There was great big bugs crawling around, and I nearly got scared to death. I went to sleep, and when I woke up we were at a big city. The three men put me in the automobile and we rode off the boat. They told me the place was Hartford."

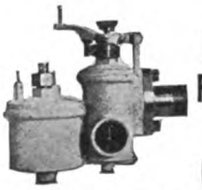
"Did the men tell you what they were taking you away from home for, darling?" asked his mother.

"No; they hardly ever spoke to me. We rode out into the country. After going an awful long time the auto stopped and one of the men got out and opened a gate in a fence, and you wouldn't think there was any gate there at all. Then they turned the auto through the gate and we were in a wood. By and by they yelled out, 'Here we are. Don't speak above a whisper.' There was a big log cabin.

"I don't remember much what happened there, except I got little to eat and I had to sleep on logs. Yesterday afternoon the men took me in the machine again and we went into the town. They went into a drug store and told me to wait outside. I saw a 'cop' and I told him about it. He waited till they came out, and then he arrested every one but me. He took them to jail, too.

"I told the policeman I wanted to go home, so he put me on the boat. He told me he'd write and tell me what they did with the men."

Against Going too Slowly.



Original, and supported by pointed arguments, is the theory of Dr. Lee H. Smith, the retiring president of the Buffalo Automobile Club, to wit, that it is the slow speed at which teams, etc., are permitted to go that makes the streets of a city dangerous.

Dr. Smith's argument is that a carriage, for instance, not allowed to stand but compelled to move at a pace not faster than a walk, is within the law, but nevertheless a menace to public safety, because everything else on the street movs so much faster.

He believes that the law and the coachman should, in a way, be whipped up. A bicycle or an automobile that has to tarry because of an obstructing cab or brougham becomes a danger not because the bicycle and the autos go fast, but because the other vehicles move so slowly that there is congestion of traffic when the faster ones catch up. Dr. Smith's theory is that the ordinance, barring necessary street crossing regulations, should make a speed that is compulsory not only with regard to limit, but also to maintenance.

In other words, Dr. Smith thinks there is a good deal of "loafing" on the streets as well as on the sidewalks, and wants all vehicles as well as all persons to "move on." He believes that the way to make a get-up-and-get town is to get up and get and get quickly, whether a-foot, a-wheel, a-horse or a-mobile.

The idea of making people and things keep up to the time instead of behind may not be such a bad scheme after all.

THE REMARKABLE ENDURANCE

OF THE

WHITE

Steam Carriages

AGAIN CONCLUSIVELY PROVED IN THE

A. C. A. RELIABILITY RUN.

IN THE 500 MILE RELIABILITY CONTEST FROM NEW YORK TO BOSTON AND RETURN, ARRANGED BY THE AUTOMOBILE CLUB OF AMERICA,

Three WHITE STEAM STANHOPES covered the distance without stop, or trouble of any kind—a perfect performance.

TWO WHITE DELIVERY WAGONS (the only delivery wagons ever completing an endurance contest), also proved their reliability by coming through without mishap.

These remarkable results immediately following the English endurance run—in which the White was one of the two machines out of seventy to make a perfect record—proves beyond a shadow of doubt the perfection and trustworthiness of the White motive power.

Write for full particulars, including Prof. Thurston's report on our steam generator, and official reports of important endurance contests.

TIRE SUIT SETTLED

G & J and Diamond Reach an Amicable Agreement—Diamond Obtains a License.

What gave promise of proving a celebrated case was last week taken out of the hands of the lawyers and settled amicably, i. e., the suit of the G & J Tire Co., Indianapolis, vs. The Diamond Rubber Co., Akron, for alleged infringements on the patents covering the well-known G & J detachable tire. The proceedings were filed in the United States Circuit Court in this city on August 28th last, and as considerable feeling had been exhibited by both sides it was expected that a long and bitter fight would ensue.

The peaceful settlement will, therefore, prove in the nature of a surprise. According to the terms of the agreement the litigation is discontinued, The Diamond Rubber Co. acknowledging the validity of the G & J patents and in return receiving a license to manufacture detachable double tube tires on the basis of a favorable royalty. The agreement was signed by Lewis D. Parker, as president of the G & J Tire Co., and W. B. Miller, as secretary of The Diamond Rubber Co.

All parties to the affair are well pleased with the outcome. The deliberateness of the Diamond people in marketing, in the face of formal warning, what they frankly admitted was an infringement of the G & J tire was an audacious move that gave evidence of their aggressiveness and the recognition of the patents by such a big, bold and financially strong company brings to the G & J standard an ally that is not to be despised. The position obtained by the Diamond detachable tire in a short three months is additional evidence of the capacity and activity of the men who make it.

The settlement out of court was not effected without strenuous opposition. It is understood that certain rivals of the Diamond Company blocked the way at every turn and endeavored by every means possible to prevent the issuance of a license, but unavailingly as results prove.

More Space for Garden Show.

In spite of the additions to the space available for exhibition purposes at Madison Square Garden, the cry is still for more room. Rising to the occasion, the Garden management is putting another plan into operation. To the main floor and galleries, the restaurant and the basement, is now to be added the tunnel in the latter.

"Just ten minutes ago the architect was here and I instructed him to mark the tunnel out in spaces, and they will be offered for sale almost immediately," said Assistant Secretary Young on Wednesday, in reply to the Motor World man's inquiry. "The tunnel measure 128 x 12 feet, and we will dispose of it in lots to suit.

"There are but two spaces in the basement left. To-day we had an application, and on looking the ground over the applicant said that he would rather have space in the tunnel than either of the two basement stands."

Twenty-one new exhibitors have secured space, among them being several prominent concerns. They are as follows:

Willis Park Row Bicycle Co., New York City; National Vehicle Co., Indianapolis, Ind.; S. B. Bowman Automobile Co., New York City; Goodyear Tire & Rubber Co., Akron, O.; Gleason-Peters Air Pump Co., New York City; H. B. Brazier, Philadelphia, Pa.; Brennan Motor Co., Syracuse, N. Y.; Century Motor Vehicle Co., Syracuse, N. Y.; Beardsley & Hubbs Mfg. Co., Shelby, O.; Improvements Mfg. Co., Boston, Mass.; Cadillac Automobile Co., Detroit, Mich.; Central Automobile Co., New York City; Kenneth A. Skinner, Boston, Mass.; Conger Mfg. Co., Groton, N. Y.; F. B. Stearns Co., Cleveland, O.; Apperson Bros., Kokomo, Ind.; Sintz Motor Car Co., Grand Rapids, Mich.; Grant Ferris Co., Troy, N. Y.; Warwick Cycle & Automobile Co., Springfield, Mass.; Motor Cycle Mfg. Co., Brockton, Mass., and Lindsay Automobile & Parts Co., Indianapolis, Ind.

To Sell International Product.

An arrangement has just been made whereby the Banker Bros. Company become the exclusive agents for the product of the International Motor Car Company for the cities of New York, Philadelphia and Pittsburg.

SEVENTEEN SUCCESSFUL

Reliability Record Better Than Supposed—Butler's Queer Actions—"The Immortals."

Seventeen instead of thirteen cars, as first appeared probable, have qualified for the chief prize in the reliability run of the Automobile Club of America, the president's cup. All, of course, had perfect scores, 2,092 points.

The successful seventeen, seven of which were steamers, are as follows:

No.	Name.	Operator.	Power.
1.	Packard	H. W. Whipple	Gasolene.
3.	Packard	G. L. Weiss	Gasolene.
5.	Prescott	H. M. Wells	Steam.
7.	Lane	J. Harrison	Steam.
11.	Haynes-Apperson	F. Mutt	Gasolene.
24.	White	P. H. Deming	Steam.
25.	White	W. T. White	Steam.
26.	White	G. S. Waite	Steam.
*27.	White	A. J. Scaife	Steam.
33.	Grout	C. B. Grout	Steam.
42.	Fournier-Searchmont	L. J. Sackett	Gasolene.
47.	Knox	H. A. Knox	Gasolene.
63.	Oldsmobile	R. M. Owen	Gasolene.
67.	Fournier-Searchmont	J. S. Bunting	Gasolene.
68.	Fredonia	C. P. Gaither	Gasoline
70.	Foster	F. J. Holley	Steam.
76.	Fournier-Searchmont	R. A. Greene	Gasolene.

*Delivery wagon.

As was stated last week, the impossibility of presenting one trophy to seventeen separate eligibles induced the club to suggest to them that each be content with a gold medal and the honor of having his name inscribed on the cup, which would remain in the possession of the club itself. The suggestion met with ready acceptance, and that procedure will be followed.

The other cups were awarded as follows:

No.	Name.	Operator.	Power.
30.	Stevens-Duryea	J. F. Duryea	Gasolene.
48.	Knox	C. S. Mason	Gasolene.
21.	Darracq	H. H. Brown	Gasolene.

These three cars made stops of 30, 20 and 30 seconds respectively. That of the Stevens-Duryea car was caused by the failure of the operator to open the stop cock between the gasolene tank and the carburettor. The Knox car lost 20 seconds by the motor being stalled, and H. H. Brown's Darracq lost 30 seconds by coming to a stop while putting on the brake.

The club's letter conveying the suggestion to the seventeen "immortals" follows:

"Dear Sir—The president of the club presented a cup to the club to be awarded to

(Continued on page 130.)

RECEIVER FOR MUNGER

Tire Company Stockholders Make the Application—Reorganization Said to be Planned.

Application has been made for the appointment of a receiver for the Munger Automobile Tire Co., Trenton, N. J., and there is little doubt that it will be granted. On Saturday last J. T. Van Cleef, representing a number of the concern's stockholders, secured from Vice-Chancellor Reed an order commanding the officers of the company to show cause on Wednesday, November 5, why a receiver should not be named, and also restraining the company from paying out any funds or carrying on its business in the meanwhile.

John L. Kuser, according to the bill of complaint, advanced the company upward of $1,400 for its payroll, and the Messrs. Stokes and the Trenton Rubber Co. have a claim of about $1,200 for material furnished. The assets are placed at $5,000 and the liabilities at $7,000.

The news will excite very little surprise, as it has been known for some weeks that trouble in the company's affairs was impending. It was formed some months ago to manufacture the Munger non-puncturable tire.

Despite statements to the contrary, L. deF. Munger says that the company will be reorganized and placed on a sound financial basis. It is the intention of the present stockholders, he adds, to materially increase their investments, and the process of reorganization is well under way.

Only Two A. C. A. Officers Renominated.

After several weeks of labor the nominating committee of the Automobile Club of America has completed a ticket to be voted for at the annual meeting of the club. With two exceptions, the nominations for the presidency and the treasurership, respectively, the old officers and directors are replaced by new ones. Rotation in office, which has been so much talked of in the club, is thus given almost full swing.

The renominations of President A. R. Shattuck and Treasurer Jefferson Seligman were anticipated.

Winthrop E. Scarritt was nominated to succeed General George Moore Smith as first vice-president, James Stillman was named in place of Edwin Gould as second vice-president, and William K. Vanderbilt, jr., in place of Harry Payne Whitney as third vice-president.

The terms of W. E. Buzby, William Henry Hall and V. Everit Macy will expire as governors. Colonel John Jacob Astor, George F. Chamberlin and Peter Cooper Hewitt have been nominated to succeed them for a three year term. Harlan W. Whipple has been named to fill the place of Juan M. Ceballos, who had still a year to serve as governor and resigned.

SEVENTEEN SUCCESSFUL.

(Continued from page 129.)

the vehicle showing the largest number of reliability marks at the end of the contest. Your automobile, together with 16 others (all of them having made a perfect score) is entitled to this cup. The committee is exceedingly gratified that so many cars have qualified for the cup, and you will, we are sure, appreciate the difficulty of awarding it under these circumstances. It is plain that the cup belongs to 17 of the contestants 'in solido.' It would hardly be a solution of this difficulty to award the cup to these 17 contestants and leave it to them to settle to whom it should belong. The committee suggests that the cup be presented 'in solido' to these 17 contestants, that their names and the names of their automobiles be put upon it and that they present this cup to the club as a memorial of this most remarkable record, and that the club, in recognition of this gift, and of the perfect score, present to each contestant a gold medal bearing the name of the contestant and his car with a statement that his automobile qualified for the president's cup in this memorable event.

"If you approve of this plan please so advise the committee. If you do not approve please make any suggestions you can as to a better method of settlement of this matter."

The announcement of awards was not without incident and created such a storm about the person of S. M. Butler, secretary of the Automobile Club, as to leave him in no enviable position. During Monday, Tuesday and Wednesday of last week Butler was an object of solicitude on the part of reporters. They had been led to believe that the announcements were due to be made public daily, and, eager for news, they fairly camped on his trail. He was polite, but unprolific of information; but as he was supposed to be dealing fairly with all, no complaint was made until Wednesday afternoon, when a rather obscure evening paper appeared with authentic news. The storm broke immediately, and under pressure Butler confessed that he had "played favorites," and, under pledge of secrecy, had given the information to an automobile publication that required it in order not to be "beaten" by a full week; the publication, strangely enough, being one that only recently had attacked President Shattuck. Instead of respecting his pledge this reporter promptly sold the news to the evening paper in question, and his employer as promptly wired it to the various contestants concerned. Just why Butler went out of his way to favor one paper at the expense of all the others has not, however, been explained.

It was thought that the report of the Contest Committee on the certificate awards would be given out early his week. The illness of Chairman Scarrit prevented a meeting on Tuesday. On Wednesday Mr. Scarritt said, in reply to the Motor World man's inquiry:

"We are trying to hold a meeting to-day, but it is doubtful whether we shall succeed. We have much work to do, however, and it is not at all certain that we can finish it at one session."

GALLAHER JOINS MOBILE

Leaves Searchmont to go to Tarrytown—Changed Policy Outlined.

Quite the most unexpected trade change that has occurred in some time came to pass this week when E. B. Gallaher, vice-president and general manager of Fournier-Searchmont Automobile Company, Philadelphia, resigned those offices to become general manager of the Mobile Company of America, Tarrytown, N. Y. The occurrence will carry with it an almost radical change in the policy of the latter concern.

It is no secret that it has lost a large sum of money, but Mr. Gallaher states that all debts have been liquidated and that he assumes charge with the company on an absolutely clear and sound basis, that being one of the conditions of his acceptance of the managerial reins. In his new position it is his purpose to pursue the same aggressive policy that marked his conduct of the Fournier-Searchmont institution and to bring the Mobile Company into the forefront.

When asked if the change from steam to gasolene would not cause him some perplexity, Mr. Gallaher smiled.

"Oh, I'll be a steam man, but with strong gasolene tendencies," he said significantly, and added, "You may rest assured that gasolene will not be overlooked."

Pressed for a more definite expression, Mr. Gallaher merely shook his head. But if a gasolene Mobile car should make its appearance before another year has spent itself it need cause no great surprise.

Goodyear Wins on Appeal.

A second victory has been won by the Goodyear Tire & Rubber Co., Akron, O., in its legal battle with the Consolidated Rubber Tire Co. On Monday the Supreme Court of the United States, sitting at Washington, denied the application for a writ of certiorari made by the Consolidated company against the Goodyear company.

It is the well known Grant patent on solid rubber vehicles tires, owned by the Consolidated Rubber Hire Co., which is in litigation. In May last the United States Court of Appeals for Ohio handed down a sweeping decision, reversing the decisions of the lower courts and holding that the Grant patent was invalid. The decision was as damaging as it was unexpected, and the Consolidated company carried the case to the Supreme Court. As stated, the latter now sustains the decision of the Court of Appeals.

The Kelly-Springfield vehicle tire is made under the Grant patent, which covers the peculiar formation or shape of the tire, the longitudinal wires which hold it to the rim and the chemical in the latter.

Necessity is the mother of invention, but it is not patented either by the maker or the buyer of an automobile.

RAIN HELD OFF

And Detroit had two Good Days Racing—Some Surprises and Sensations.

Detroit, Mich., Oct. 25.—Perseverence gained its reward at last for "the Rainmakers," as the Detroit Automobile Association had come to be known, were finally enabled to run off their twice postponed races at Grosse Pointe track yesterday and to-day.

For a time it looked as though disappointment once more awaited them, for to-day (Saturday) the "big day" of the meet, opened ominously, the skies being dark and lowering and a few drops of rain actually falling, but happily the clouds cleared away and while the day proved raw and chilly the programme was run practically as scheduled. Some rattling good racing resulted, and when the lateness of the dates are considered, the attendance was surprisingly good and of the enthusiastic kind. The trade was liberally represented and the success of the event was a deserved tribute to William E. Metzer and his popular associates.

The racing furnished several surprises, among them the defeat of the Winton Bullet by both the Cooper racer and H. S. Harkness' Mercedes, due, however, to hard luck, as Mr. Winton could not get his famous flyer going properly, and in consequence made nowhere near his best time.

The Cooper racer, a huge, ungainly looking monster with no compensating gear, roaring and pounding in a fearful way, was driven wildcap fashion by Barney Oldfield, who tore off miles at a terrific clip, establishing a track record of 1.04 1-5 and doing the five miles in 5.28. It seems incredible, but it is asserted by Cooper that Oldfield had never driven any kind of an automobile two days before, and the ex-bicycle rider certainly showed himself a man of nerve.

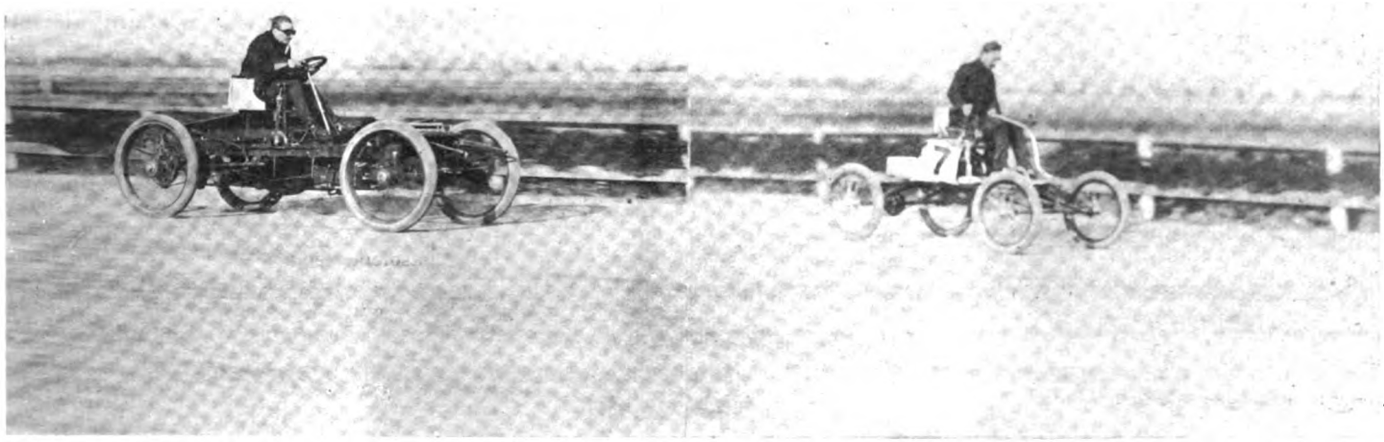
His performance was a hair-raising one, and local pride in his victory made his win popular.

In the smaller gasolene classes the Elmore, Northern and Olds made a splendid showing, the first named winning the Russell House Cup, the prettiest trophy of the day, while the little Northerns showed a tremendous burst of speed, one of them doing a mile in 1.26 and only prevented from winning the handicap race in which it started by an accident that happily was without serious results.

Alex. Winton, with the Bullet, had just been sent off and had not yet gotten up speed. He came down the track on the outside and at the curve turned sharply toward the pole. Mr. J. D. Maxwell with the Northern, in which he was making a runaway race, came tearing up from behind and, evidently believing that Winton was aiming to take the pole, turned sharply so as to pass him on the outside. Winton, however, instead of dropping into the pole position, turned, as he himself stated to a Motor World man, so as to allow the machines behind him about fifteen feet of room on the inside or pole position. The result was that Maxwell dashed into the Bullet, was thrown with fearful force, his machine turning a complete somersault and being dashed to pieces, while the horrified spectators were relieved a moment later to see Mr. Maxwell pick himself up out of the cloud of dust and walk away unaided, while willing hands hastily gathered up the remains of the wrecked vehicle, getting the track clear before the big machine came tearing around. In passing, it may be said, that it would seem that this accident ought to point a lesson and that a track rule which would be thoroughly understood and which would provide that machines in getting up speed should keep clear to the outside of the track and thus prevent any possible confusion on the part of the driver coming up behind them.

In handicap races, especially where big and little vehicles are in together and there may be drivers of limited track experience, such a rule would make for safety.

The Oldsmobile made a fine showing, annexing the ten miles handicap on Friday and getting first, second and third in the five miles open for vehicles of 5 h.p. and under on Saturday.



In the steam classes the White as usual cleaned the boards the first day, but on the second for the first time on any track it was forced to be content with second place, a freak machine that the crowd likened to a Mississippi River boat and from the regular smokestack of which issued a long cloud of smoke precisely like that left in the wake of a railroad train, steaming around the track in almost record time. It was not an automobile, being a freak racing craft pure and simple, while the White entry was the regular racer driven by Mr. Windsor T. White and which made the five mile world's record at Cleveland.

In the electrics the Baker car outclassed everything on Friday, winning the two-mile race in 4.14, the 200 yards obstacle race, and on Saturday making world's records for both five and ten miles, setting the figures for the former at 17.58.

All these feats were accomplished with the same runabout with top that Mr. Baker used at Cleveland.

The ease with which Mr. Baker overtook and passed his competitors whenever he got ready called forth admiring remarks, while even after making his record he chased the Bullet for nearly a lap, keeping

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y, Post Office, November, 1900.

NEW YORK, OCTOBER 30, 1902.

The Old Lie Exploded.

Whenever an autophobe or blatherskite seeks to score a point against the motor vehicle he speaks in affrighted or profound tones of "the appalling list of accidents" due to its use. Some of the more astute or more embittered have been known to bring an accumulation of newspaper clippings in seeming substantiation of their assertions.

It was the continued harping on this string that induced the Motor World to gather and print during the past month its weekly budget of casualties caused by the various means of vehicular locomotion. The itemized record leaves no room for question or dispute, and the recapitulation for the month is one that puts the blatherskites to rout, and that should call to their senses those automobilists who are inclined to be affected by the hue and cry created by the sensationalists and demagogues, and who would sacrifice their birthrights on the altar of expediency.

Far from being appalling, the Motor World record proves the casualties due to motor vehicles to be comparatively insignificant. From September 25 to October 25—the dates embraced in our statistics—they were concerned in but 14 accidents, none of them fatal ones. On the other hand, the horse is chargable with 33 death and 336 injuries, while the railroads killed 425 persons and injured 530; the trolley, 64 and 337 respectively, and the bicycle, 1 and 63—a grand total of 523 killed and 1,280 injured.

Comment cannot add to the impressiveness of these figures.

Learned gentlemen will, of course, bring to bear the law of percentage, but it cannot affect the purpose which we sought to serve—that of combatting with cold facts and figures the much-mouthed and much-written fiction that deals with the "appalling record of the automobile."

The motor vehicle is largely the victim of newspaper headlines. Short of wholesale slaughter the casualties in a railroad or a street car accident are usually dismissed in a dozen lines, the deaths a-horse receive little if any more space, but one death due to an automobile and nothing less than half a column, with big, black headlines on the front page will suffice.

We do not mean to say that the newspaper men do not know their business, but we do mean to say that it is their headlines that have deceived not only the autophobes and blatherskites, but some of the editors themselves.

We have collected the evidence and placed it within the reach of all. Whenever and wherever blatherskites arise it should be used to give them the lie and to stie their rantings.

One Thing That Was Demonstrated.

It may or may not be true that as a direct consequence of the reliability contest a number of sales of delivery wagons were made, with immediate deliveries specified.

But whichever the case may be, it is beyond dispute that such a result should follow the run.

The result of the test was to demonstrate unmistakably that the motor vehicle of today, whether intended for business or pleasure, is, in the hands of a competent operator, as reliable as any drawn by horses. Its greater efficiency is, of course, beyond dispute. But until the run referred to just the contrary was the case as regards its dependability. Claims made for it in the past had not been substantiated, and the bad behavior of some vehicles had caused suspicion to fall on all.

It is time for a new deal, a fresh shuffling of the cards. The motor business wagon is wanted, and wanted badly. Business men everywhere are waiting for it, needing only to be assured that it is what is claimed for it.

The very considerable progress that has been made within the year, the steady though slow increase in the number of practical business vehicles in use, has prepared the way. With the prestige of actual and extended performances to use as a lever the task of convincing hard headed business men that they cannot afford to use horses for hauling their goods should be a much easier one than it has been in the past.

Borne Out by the Result.

Now that the smoke of battle has lifted and we are able to discern, by means of the official or semi-official reports, that the first impressions concerning the reliability contest were correct ones, it is scarcely amiss to congratulate ourselves anew upon the result.

In view of the rigid scrutiny to which the cars for which a flawless record was claimed were subjected, it is matter for surprise—not that the official list contains the names of only seventeen instead of twenty acrs as first listed—but that the list should be so large. There was so much room for error, so many points upon which the rules and the observers could honestly disagree, so many claims and counter claims made, that we cannot do otherwise than express satisfaction at the outcome.

It is interesting to note in passing that of the three cars dropped from our list of twenty cars published the day after the run came to an end, one, a Knox, figures in the other cup winners. The other two, a Stevens-Duryea and a Grout, have been cast out for some as yet unknown reason. The other seventeen cars are exactly as we forecasted

Digitized by Google

them, thus verifying in a remarkable manner the accuracy of our report.

These seventeen cars were each given 2,092 marks—the highest number that any car could receive.

That means that throughout the six days of the run these seventeen cars never faltered or failed. Four times a day they reported to the officials, ready to have their time given them or taken, never varying from the schedule mapped out, never making an unpenalized stop, never going wrong from any cause. More convincing performances than these could not be desired, much less made.

If we turn to the other members of the gallant band that went to Boston and back we find scarcely less cause for congratulation.

Three of them—the winners of the Scarritt, Chamberlin and Hill cups, respectively—are credited with having been charged with one bad mark each, with totalling but 2,091 instead of 2,092 points. The stops, be it noted, did not in any case exceed one minute in duration, and at least one of them is said to have been due to the operator's error rather than to any defect in the car itself.

Truly, no more marvellous showing could be made. It speaks volumes for the cars and for the men who drove them.

We have yet to learn the details of the certificate awards, the committee not yet having rendered its report.

But the latest unofficial advices place the number of cars qualifying for first class certificates—an average speed of between twelve and fourteen miles an hour being required—at fifty or more. Of the remainder of the sixty-seven finishing cars a considerable majority are supposed to have won second or third class certificates.

These figures agree very closely to those given in these columns at the close of the contest, and there is every reason to believe that they are approximately correct.

They demonstrate most conclusively that the motor vehicle of to-day is both practical and practicable, and that the time is ripe for it to enter into largely extended use at the hands of those who have been waiting for it to be "perfected."

A Failing Member.

Who that has driven a gasolene car any considerable time has not had forced upon him the disagreeable conviction that his clutch is slipping?

It is inevitable that it should be so. The clutch can no more be used without constant attention and inspection than a bearing can be run without oil; indeed, not as much, for there are not a few people who claim that with certain bearing surfaces lubrication is quite unnecessary.

As it has been so sagely remarked, "Eternal vigilance is the price of success."

So with clutches. They are imperfect devices at best, and nothing but never ending care will ever make them yield the best results.

The chauffeur or mecanicien who neglects his clutch, or gives it only a fair amount of attention, need have no expectation of freedom from trouble. He is literally sowing this commodity, and it is only a matter of very short time when the harvest will be ready and he will begin reaping, whether he would or not.

With a perfect knowledge of this failing of even the best clutches there should come safety; for is it not said that "forewarned is forearmed?" But this safety comes only to the man who labors for it and makes frequent examinations of his clutch to see that it takes hold neither too little nor too much; that it neither slips nor sticks—that, in short, it is properly adjusted whenever the engine is started and the clutch is thrown in.

Thus, and thus only, will immunity from the troubles that were so noticeable during a recent important function be purchased.

Why Not a Round Robin.

Inasmuch as seventeen machines have been figured out to have won equal glory in the New-York-Boston competition, why should the name of any precede the others in the inscription on the cup? In a case like this it would seem to be an excellent thing to revert to a good old custom and so inscribe the names that they will appear in the form of a "round robin."

In olden days when a letter of complaint or protest was to be written to the potentate, no one wanted to be the first to sign the paper, and as a way out of the dilemma the "round robin" was invented. With the names written in a circle, no one has precedence, and each has equal honor.

The suggestion has greater value in connection with President Shattuck's cup because there are two rather small oval spaces on it for inscription. The names laid out in circular form would permit of the use of larger letters and a consequent greater display than would be possible if they were inscribed in horizontal parallel lines. There would seem to be economy of space as well as appropriateness and artistic effect in the adoption of the "round robin" idea for this remarkably won trophy.

Some Light on Air Cooling.

It has been contended by more than one well posted worker in the gasolene engine field that a mistake was made in almost completely abandoning the air cooled motor.

The performance of several cars of this type in the reliability contest, to mention only one item, certainly lends some color to this contention, so far as it has application to the lighter cars. They ran day after day without overheating. We took occasion several times to examine them at the finish of a run, and satisfied ourselves that they were in good order. As regards one of the makes referred to, this was not surprising, for it has been tested sufficiently to set all doubt at rest.

It is probably true that the more powerful or speedy cars must be water jacketed.

But it is not equally certain that the same must be said of the small cars. With them no insuperable objections to air cooling appear: on the contrary, it is beyond dispute that in some small cars air cooling is eminently practical, and it is only a fair proposition that it will be equally satisfactory with others.

It is hardly necessary to call attention to the great advantages that follow upon the use of an air cooled motor.

When freezing weather comes the objections to water jackets are, of course, the greatest. But they differ only in degree in ordinary weather. The much greater complexity of the water cooled motor, with its mass of pipes, connections, tanks, radiating appliances, pumps, etc., is well known, and its capability for giving trouble is in direct ratio thereto.

About the worst of a long list of bad ordinances is the one just introduced in Kansas City and given in full in another column. It provides that both the automobile and its owner or user shall be licensed; that the former shall carry lamps having painted on them in red the license number, and that the owner's initials in letters eight inches in height shall be carried on the sides and rear of the car. It is little wonder that in view of these and other offensive provisions the ordinance should have been denounced by one of the body called upon to legalize it.

RAIN HELD OFF.

(Continued from page 131.)

on nearly even terms with it, and was heartily cheered.

The machine was absolutely noiseless, ran very smoothly and on each occasion gave a splendid account of itself.

Considerable disappointment was felt at the inability of the new Peerless racer to start against the other big machines. It was at the track, came down once and moved very smoothly, but a cam-clutch slipping precluded it from competing. It was a sore disappointment to L. P. Mooers, who had worked hard to get it ready.

The summary follows:

FRIDAY.

Five mile race for steam road machines. Won by Windsor T. White (White); John McDonald (Geneva), second. Time, 10m. 42s.

Five mile race for gasolene cars; 1,000 pounds or under. Won by J. G. Reiners (Locomobile); J. D. Maxwell (Northern), second; W. Wigle (Oldsmobile), third. Time, 10m. 51 4-5s.

Third Race.—Five miles; 2,000 pounds and under; gasolene vehicles. H. S. Harkness (Mercedes), first. Time, 6m. 1 2-5s. Charles B. Shanks (Winton), also started.

Fourth Race.—Ten mile handicap. J. L. McNamara (Oldsmobile), first, with 61½m. allowance; H. L. Harkness (Mercedes), (1½m.), second; Windsor T. White (White), (3m.), third. Time, 18m. 15 1-5s.

Fifth Race.—Two miles; electric vehicles. W. C. Baker (Baker), first. Time, 4m. 14s.

Sixth Race.—Two hundred yards; obstacle. W. C. Baker (Baker), first.

SATURDAY.

Five mile race; gasolene cars; 1,000 pounds. W. Wigle (Oldsmobile), first; D. B. Huss (Oldsmobile), second. Time, 7m. 50s.

Five mile handicap race; gasolene cars; Detroit; private owners. W. Rocherman (Elmore), (4m. 15s.), first; W. C. Rands (Ford), (scratch), second; J. W. Eddy (Winton), (2m.), third. Time, 8m. 32 4-5s.

Three mile; steam cars. W. C. Buchman (Geneva), first; W. T. White (White), second. Time, 4m. 7 2-5s.

Ten mile handicap. C. B. Shanks (Winton), (2m.), first; H. S. Harkness (Mercedes), (45s.), second; W. T. White (White), (2m. 30s.), third. Time, 13m. 34 2-5s.

Five mile; Manufacturers' Challenge Cup, open only to members of the American Motor League. Barney Oldfield (Cooper), first; C. B. Shanks (Winton), second; W. C. Buchest mile, 1m. 4 1-5s.
man (Geneva), third. Time, 5m. 28s. Fast-

Twenty miles; open. H. S. Harkness (Mercedes), first. A. Winton stopped at end of 10 miles.

The trade was unusually well represented at Detroit, including men from New York, Chicago, Cleveland, Toledo and other places. It was practically the same crowd that was here twice before and the majority of whom had each time pledged themselves to come again when the races were postponed. It is doubtful if there is another man in the trade who could get so many busy men to journey the distance, but "Billy" Metzger is deservedly liked by everyone and it is on his account personally that many of them were there. Of course the local trade were out in force, and in aadition there was noticed Fred White and M. L. Goss of the Baker Motor Vehicle Company, who came over with Mr. Baker. Mr. Goss, as usual, was everywhere, and as he knows about everyone, he was a busy man. Others were F. Philip Dorn, of the American Ball Bearing Company; McCrea, of F. B. Stearns Co.; Treasurer Brown, of the Winton M. C. Co.; Manager Kittredge, of the Peerless Manufacturing Company; E. E. Kirk, George Troup and Charles Hall, of Toledo; . W. Packard, James Becker, W. B. Post, Clarence Whitney, W. H. Kirkpatrick, Benj. Smith, W. L. Githens and many others.

Fred G. Mott, Jr., and E. R. Lozier were in Detroit—together.

One of the new Cadillac cars made its appearance at the track and evoked much favorable comment. It is a handsome appearing vehicle, substantial and yet trim looking, runs with absolutely no noise or vibration, starts without any grinding or noise of clutch engaging, and at the rumored

THE GENEVA "TUG."

price of $750 is likely to prove a sensation in the trade.

This company is very strongly backed and proposes to turn out a large number of vehicles the coming year, and it is known that they are likely to have as sales manager one of the best known and best equipped men in the trade.

The Cadillac looks like a winner and if present plans are carried out the company are bound to become big factors in the automobile industry.

Brooklyn's New Club.

With the incorporation of the Kings County Automobile Club, papers for which were granted last Saturday, a Brooklyn organization of considerable promise enters the automobile field in Brooklyn. This fact was emphasized by Geo. A. Needham, one of the directors, in a conversation with the Motor World man on Wednesday.

"The Kings County Automobile Club will be entirely separate and distinct from the Kings County Wheelmen," he continued. "But we shall meet at the clubhouse of the latter, at 1,255 Bedford avenue, and make use of its facilities for storing, etc. It has a fine clubhouse and grounds, with room to house sixty vehicles, and is in every way suited for our purposes. Many members of the Wheelmen are or will be members of the Automobile Club, and there will be perfect harmony in the organizations."

Two Incidents of the Run.

There were many curious happenings during the reliability run, some of them very funny. One of these was witnessed by the Motor World man at Hartford, during the luncheon at the Allyn House given by the Hartford Rubber Works Co. It was on the up trip, and acquaintanceships were still being made.

"It's all right, of course, for he is as honest as the day, but I had to laugh to see that Thomas B. Jeffery was acting as observer on one of his own cars—a little Rambler runabout," remarked one of about half a dozen men seated at the same table. "The committee that made that assignment must have been easy"——

He got no further, for simultaneously from his right and left hand neighbor came something like this:

"He's nothing of the kind. The car he is in is not entered at all. He is just travelling along with the bunch on his own hook."

And then it came out that the right hand man was the operator of one of the Ramblers that was in the contest, while the left hand one was driving the identical car which Mr. Jeffery was riding in. Consequently each of them knew what he was talking about.

Among the many bits of jollity during the trip there was one occurring at the Cooley House, Springfield, in which a persevering exponent of the Winton carriage and motor had an interesting demonstration of the "motor under the seat" proposition. Approached quietly from behind this persevering disciple of Alexander felt himself suddenly seized by the slack of the trousers and the coat collar. He was then rushed downstairs and into the shiny counter where the liquid joy was dispensed. There the Winton man declined to reproach the other and said frankly that he had enjoyed the trip down the stairs owing to the fact that it left him more than ever convinced that the best place for the motor was under the seat, where the Winton cars have it. What else was said was much interrupted by the gurgling of stopperless bottles.

Suggests a Drastic Remedy.

From Detroit comes the same old story of non-starting entrants To judge by the programme plenty of starters seemed to be assured, especially as all of them were bona fide. When it came to lining up for the starter's pistol, however, there was frequently a very different story to tell.

Owing to the presence of Chairman W. J. Stewart of the race committee of the American Automobile Association, who officiated as referee, drastic measures seem in a fair way of being adopted to cope with the matter. Mr. Stewart's plan is very simple. It is to make it compulsory to post $50 with an entry, the money to be forfeited if the entrant does not appear or refunded if he does.

Bankers in New Quarters.

A lease has been executed by the Banker Bros. Company, under the terms of which the building at 139 and 141 West Thirty-eighth street, this city, passes into their possession. The concern is fitting it up as an automobile station, and moved into it this week.

THAT QUAKER ORDINANCE

Its Oddities and Absurdities—Board of Boiler Inspections Great Powers.

The best that can be said for the ordinance introduced in the Philadelphia councils regulating the speed of automobiles and other vehicles is that it does contain some provisions framed in the interests of the former. But it also goes very much further in the opposite direction. It imposes so many restrictions, among them being a licensing scheme, under which th owner of any automobile must obtain a certificate from the Bureau of Boiler Inspection, that it is even worse than the present condition of things.

The text of the ordinance, given below for the first time, cannot but add to the surprise that it should have been framed, in part at least, by automobilists themselves. Its salient features follow:

Section 1. The Select and Common Councils of the City of Philadelphia do ordain, That from and after 60 days from the passage of this ordinance no vehicle drawn by animals shall be driven upon the streets or highways of the city of Philadelphia without an attendant at the animal's head or holding the reins, and no power propelled vehicles without a competent attendant in charge at the controlling mechanism.

All vehicles when driven or propelled on the streets or highways, excepting those proceeding at a rate of speed not faster than a walk, shall carry between sunset and sunrise a white light or lights in a conspicuous position, so as to readily be seen from in front, with a red signal which can easily be seen from the rear, and in addition such further signal as may be required for their special classes.

All bicycles or similar vehicles and all vehicles propelled by other than animal power shall be provided with suitable signal that can be distinctly heard a distance of 30 yards, and the drivers shall sound same whenever necessary to warn pedestrians or other vehicles of their approach, but such sounding of signals shall in no way give any special privileges or right of way.

No vehicle propelled by other than animal power shall be left upon the streets or highways without being first arranged so it cannot start by itself and without proper precautions for subduing the noise of the motor, and any one tampering with such vehicle in the absence of the occupants shall be arrested immediately for breach of the peace and disorderly conduct.

No vehicle driven by any other than animal power shall be operated on the streets or highways until a certificate has been procured from the Bureau of Boiler Inspection that the boilers, reservoirs, valves and such parts as are employed for holding steam, or explosive, or inflammable products, or electricity shall be so constructed as to be safe and prevent the escape of such material. Said certificate shall be always carried upon the vehicle for which it has been issued, and the number of the certificate issued by the Bureau of Boiler Inspection placed upon vehicle so that it is plainly visible. An inspection shall be made annually or oftener if necessary by the Bureau of Boiler Inspection, and a fee of one ($1) dollar shall be paid for said inspection.

No vehicle propelled by other than animal power shall be driven on the streets or highways in such a manner as to interfere with other traffic, and the driver or operator shall stop such vehicle, and if necessary shut down the motor of same when requested by the occupant of a vehicle propelled by animal power until such latter vehicle has passed.

All vehicles propelled by other than animal power shall be equipped with good and sufficient brakes which shall be capable of checking the speed of the machine whether going forward or backward, and which shall be so arranged to act independently and directly upon the wheels, so that the failure of any part of the propelling mechanism or gearing shall not affect the action of the brake. They shall also be provided with the necessary appliances, such as steam condensers and mufflers, so as to stop the unnecessary escape of steam or vapor or noise in the operation of said vehicles in the streets or highways.

Any person violating any section of this ordinance shall be subject to a fine of five ($5) dollars for the first offence and ten ($10) dollars for the second offence, and twenty-five ($25) dollars for each additional offence thereafter; said fines to be collected as like fines are now collected by law. Provided, however, that for any excess of speed of any vehicle propelled by other than animal power above that hereinbefore allowed, such offender for the first offence to pay a fine of not less than twenty-five ($25) dollars, and in case of a second offence by the same offender the certificate of the Bureau of Boiler Inspection shall be withdrawn from his machine for the period of three months. But this provision shall not in any way hold to interfere with the criminal prosecution of such offender for his violation of the law.

All ordinances or parts of ordinances inconsistent herewith be and the same are hereby repealed.

Page Sails to Sell Olds Abroad.

With the purpose of carrying the Oldsmobile gospel into foreign lands, Carl H. Page, of this city, sailed on the steamship Minnehahd on Saturday en route for London. His plans are wide reaching, embracing what is virtually a tour of the world. An arrangement has been made with the New York Export & Import Co., which has branches in many foreign countries, to take the trip in their interests, demonstrating the capabilities of the Oldsmobile and making sales wherever possible in the countries controlled by the above concern. From London, Page will go to Marseilles, Genoa, Port Said, through the Red Sea, etc., to Bombay, Delhi, Calcutta and Yokohama to San Francisco, and back to New-oYrk.

DEFEAT FORESHADOWED

L. A. W. License Law Receives a Preliminary Jab—Other Ordinances Considered.

It became quite evident last Friday afternoon how the ordinance requiring the licensing of automobiles that was drawn by a person named Thompson, who claims to represent the L. A. W., is to fare at the hands of the Board of Aldermen. The suave man with deep set eyes and drawling tones who wrote the document is quite likely to be the only one to have any kind word to say for it, unless he has with him on November 7 some associates and friends in the L. A. W.

The symptoms of the nausea which the proposed ordinance has created were manifested on Friday before the law committee of the Board of Aldermen, which was called for the purpose of giving a public hearing on the street sprinkling ordinance and the ordinance to regulate street traffic and permit a speed of ten miles an hour for bicycles and automobiles.

Alderman Armitage Matthews was in the chair, and Alderman Joseph Oatman, who fathered both the ordinances mentioned, was among the committeemen present. J. Bayard, of the Committee of Fifty, was present to oppose the legalizing of a ten mile an hour speed, and J. L. Brower was there to help him. Both told doleful tales of the danger there is now in crossing the streets for women and children. They did not mention that the danger existed years before the advent of the bicycle and the automobile. Mr. Brower said that in London, where there is a speed limit of 12 miles an hour, the people are getting tired of it because the vehicles go faster than that. Mr. Brower did not know that the speed limit in Paris is 20 miles an hour, and the pertinency of the fact that both London and Paris are bigger than New York seemed to entirely escape his mind.

Mr. Bayard, of the Committee of Fifty, said with regard to the automobile license ordinance that his organization had not given it much consideration, but he thought that any such regulation should be a State law. He remarked that if a man in an automobile was required to carry a specific license for every town through which he might wish to travel he would not have any room for baggage in his machine.

The law committee decided to adjourn the hearing on the sprinkling and traffic ordinances until November 7, and to have a hearing on the license ordinance the same day.

Crest Moves Offices.

The offices of the Crest Mfg. Co. have been removed from 424 Massachusetts avenue, Cambridge, Mass., to the factory at Cambridgeport. The company will hereafter occupy the entire building.

All Characteristis of the Age.

The increasing commercialism of modern life, together with the increased noise, received the attention of Dr. Felix Adler on Sundaya, when he spoke at the meeting of the Society for Ethical Culture at Carnegie Hall, this city.

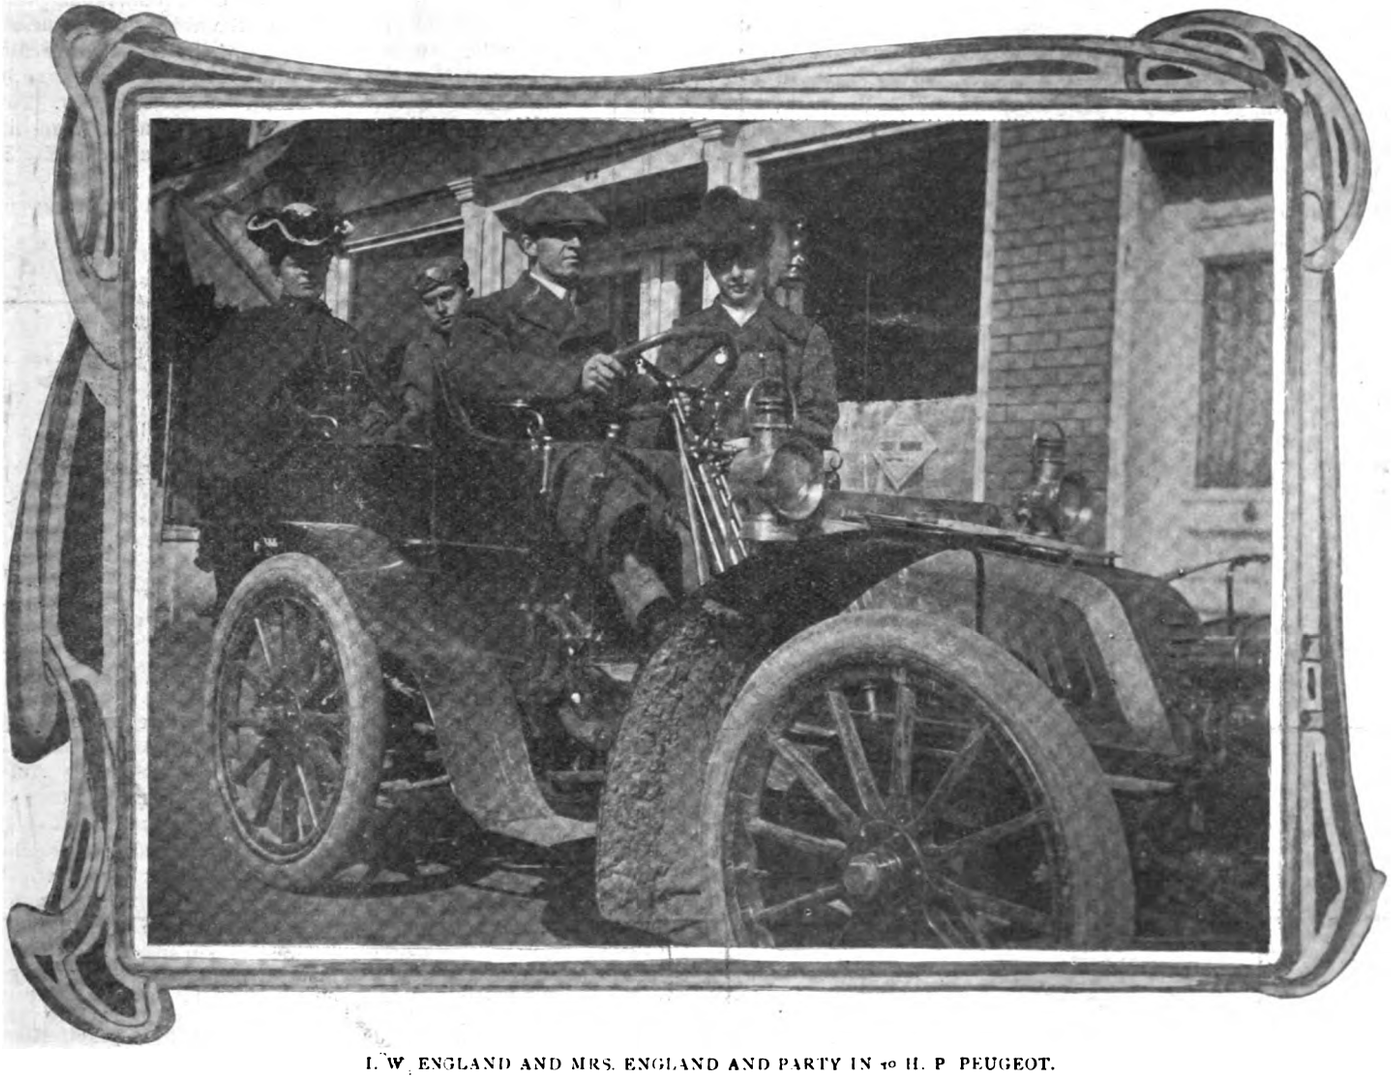
"In the country," he said, "all is harmonious and peaceful. Even the screech of an owl is noticeable. What a contrast when we are whirled suddenly into a great city, with its clanging bells, rumbling cars, rattling wagons and those new horrors, the automobiles, threatening life and limb.

"But it is all typical of the age. Never before were there so many big cities and so much feverishness and lack of peace on the part of the inhabitants. The world seems to be possessed by the demon of commercialism."

No Trouble About Water Supply.

There was one type of car in the reliability contest that did not have to bother much about its water supply. It is scarcely necessary to say that this was the White.

As a matter of fact, each of the five Whites could have gone through the entire run without replenishing its supply, and they did perform the feat of making no stops for this purpose between controls.



Upon reaching one of the night controls the Motor World man took occasion to ask one of the operators about his water supply.

"I've lost not quite two gallons on to-day's run," was the reply as he peered into the tank. "There is pretty nearly 25 gallons in there now. You see, I only fill the tank once a day, and I need not do it then. But as a matter of precaution I think it best to do so.

Ignored the Evidence.

When in doubt give the automobilist the worst of it seems to be the rule actuating courts and juries just now. At Buffalo, N. Y., last week, in the suit brought by Albert Beinzt, eleven years old, against Walderman J. Schultz for $1,000 damages for running the boy down with an automobile on Genesee street, near Camp street, last July, the jury reported a verdict in favor of the plaintiff for $345.

The plaintiff's guardian claimed Schultz was driving his vehicle at an unlawful rate of speed, and did not give warning to the boy. Schultz's defense was that he was going at not over six miles an hour, that he did sound a warning, and that the boy suddenly darted out from the sidewalk into the path of the machine.

I. W. ENGLAND AND MRS. ENGLAND AND PARTY IN 40 H. P. PEUGEOT.

A more eloquent tribute to the efficiency and reliability of the White condenser, which has been in use the greater part of the season, it would not be easy to obtain.

Give Nuts Equal Tension.

When tightening nuts on to bolts which hold any cast portion of the motor in position great care should be taken, if there are more than one bolt holding the cast portions together, that the nuts are screwed equally. Each nut should be screwed down a little in turn, and not one tightened and then the other. It is also well to remember that most parts of the engine expand as soon as it heats, and that it is quite unneccessary to screw down every nut with a two-foot spanner.

Tampered With the "Bullet."

Close upon the heels of the Detroit races comes the charge that the Winton "Bullet" was tampered with, which accounts for its poor work on the second day. Upon returning to Cleveland an examination was made, and it was discovered, it is said, that the "sparker cam had been fixed so that it would not work when high speed was wanted."

Digitized by Google

The Old and the New Conflict.

It was in front of Sherry's Forty-fourth street entrance, at the luncheon hour, when the crush of wheeled and other traffic was at its height.

Biff, bang and biff again it went, as two men engaged in an impromptu but fierce set-to in the middle of the street. The blows fell fast and furious, but most of them were warded off or dodged, and did little damage. Round No. 1 came to an end in less than a minute, and the two men glared at each other while they recovered their breath. The Motor World man wondered what it was all about. He was soon enlightened.

"I got out of your way when you asked me to," said one, a coachman, young, but burly and apparently as "hard as nails." "You needn't think that you fellows own the streets just because you drive automobiles."

"Aw, go on, and don't block up the road again," returned his opponent, a smaller man, but with lots of nerve and science.

At that the first one jumped in again more fiercely than ever, and strove to get his opponent's head "in chancery." Unsuccessful in this a number of stiff body punches were exchanged. These were taken unflinchingly, but each man guarded his face with grim determination, evidently mindful of his appearance. Before any damage had been done an attendant from Sherry's came over and separated the two, still muttering and glowering.

To a bunch of sympathizing cronies the coachman related his story, while he picked up his greatcoat and hat from a finely appointed landau with a high stepping pair of horses. Then he took his seat on the box and waited, immaculate apparently, for his mistress to appear. The other man climbed into his perch on one of the bix four wheeled cabs and made audible comments on the "cheekiness" of "them horse coachmen."

And the battle between the conservative and the radical, the old order and the new, came to a rather unsatisfactory end.

Good Racing at Toledo.

Toledo, O., had its first taste of automobile racing on Tuesday, and evinced a decided liking for it. The weather was anything but pleasant, being very cold, with a disagreeable wind blowing across the track.

H. S. Harkness and L. P. Mooers took turns at beating each other, while a special match race between Oldfield and Cooper resulted in a victory for the former. The results follow:

Five miles, gasolene cars, 1,000 pounds or less—Won by W. Wigle, Olds, Detroit; E. Z. Koch, Olds, Toledo, second; B. C. Gamble, Olds, Toledo, third; Ed Affleck, Olds, Toledo, fourth. Time, 9m. 12s.

Five miles, gasolene machines, 2,000 pounds or less—Won by H. S. Harkness, Peerless, Cleveland; L. P. Mooers, Peerless, Cleveland, second; Carl Fisher, Winton, Indianapolis, third. Time, 9m. 53s.

Five mile handicap, open—Won by L. P. Mooers, Peerless, Cleveland (scratch); H. S. Harkness, Peerless, Cleveland (1m.), second; Carl Fisher, Winton (1m. 30s.), third. Time, 7m. 14s.

Five mile match race—Won by Oldfield; Cooper, second.

Demand for Storage Places.

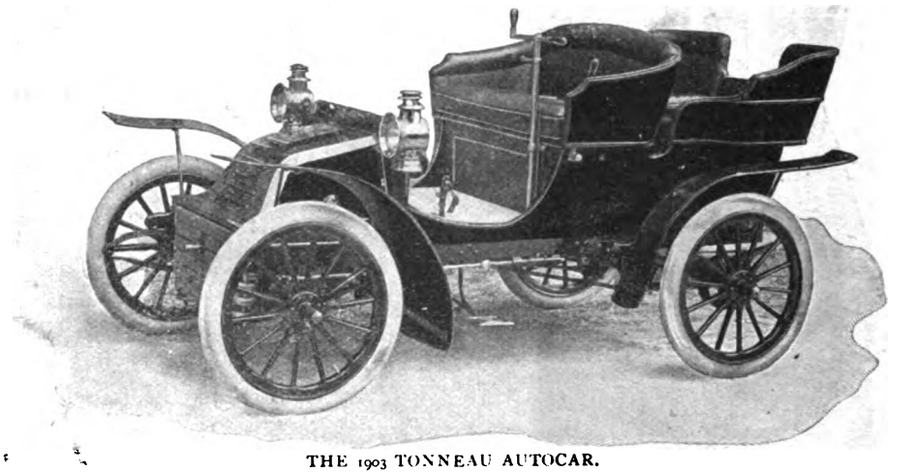
The great increase in the number of automobiles owned by New Yorkers and stored in this city has brought about a condition of affairs which has an interesting and important bearing on the industry.

Automobile storage stations, as a rule, have all the vehicles they can care for, and still the number of automobiles increases rapidly every day. To meet this demand a number of new stations are about to be opened, and have already enough business promised to place them on a paying basis.

It is difficult to find properties that answer all the requirements for a successful automobile station. In the first place, the location must be central, then there must be a large and accessible floor space, solid fireproof construction and a rental that is not absolutely exhorbitant.

Proposed Danish Regulations.

Danish autophobes have got in their deadly work, to judge by an extraordinary bill to regulate the circulation of automobiles which has been placed before the Rigsdag. According to this, automobiles must go at a maximum pace of only six miles in towns and eight miles on the main roads in the country, and driving is totally prohibited on roads not over nine metres wide and on the Strandvej, running from Copenhagen along the Sound to Elsinore, through all the smart bathing and watering places.



Furthermore, the bill prescribes that an automobile driver must stop any time he meets horses which are "supposed" to be frightened. If the bill becomes law it will surely kill all automobile sport in that country in a short time. Electric and other noiseless carriages, as well as motocycles, are all placed under the ban in the same category.

The New Tonneau Autocar.

It is very much improved and reinvigorated Autocar Company that is busily engaged at Ardmore, Pa., in preparing for the 1903 season. A number of changes have taken place in the concern, almost amounting to a reconstruction, and a most aggressive policy will be carried through in future. The financial standing of the company is of the most substantial character, and insures the undoubted success of its undertakings.

For some months also the factory arrangements have been undergoing radical changes. Under the able supervision of the well-known John C. Spiers, the machinery and other labor saving appliances have been brought to a high state of efficiency. To-day the plant is one of the most finely appointed in the United States. It has a capacity of 15 cars per week.

For 1903 the Autocar Co. is putting out as one of its models an attractive looking tonneau body car, styled Type VIII, Model A.

THE 1903 TONNEAU AUTOCAR.

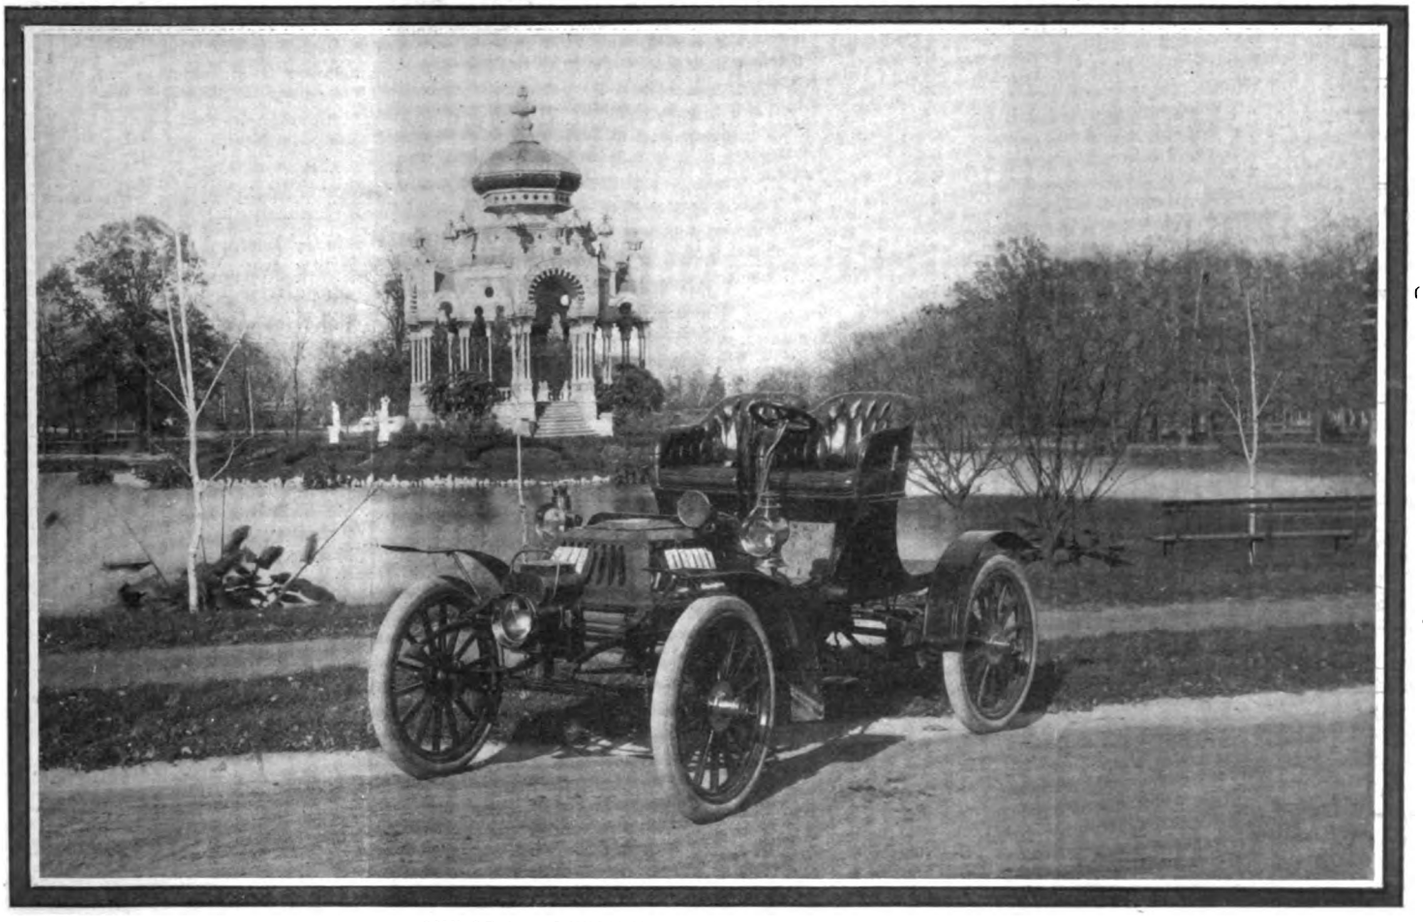
This car is equipped with the Autocar Co.'s double cylinder horizontal motor, which develops 10 horse power at a speed of 1,000 revolutions per minute, and has aluminum crank case, excluding dirt and dust. The crank shaft is set at 180 degrees, practically eliminating vibration; the fly wheels are double. Ignition—jump spark.

A vaporizer of the float feed type is used, having the throttle and mixing valve combined, insuring a perfect mixture at all speeds, the throttle acting practically the same as in the steam engine.

There are three speeds forward and one reverse, with slide gears of drop forged steel Harveyized, encased in aluminum. Speed of car forward from 2 to 25 miles per hour—reverse, 6 miles. The drive from the transmission case to rear axle is by means of two steel cardan joints, hardened, with shaft, driving a bevel bronze gear.

The wheels are 30 inches wooden artillery patern, fitted with 3 inch double tube detachable pneumatic tires.

There are three brakes in all, two of which are applied to the two rear wheels direct. Gasolene and water capacity for two hundred miles over average roads. Circulation of water by means of a centrifugal pump, chain driven, insuring perfect circulation.



The car weighs 1,500 lbs., and is priced at $1,700. It is finished in red, with red trimmings; also in green, with green trimmings, with black and gold striping.

Kansas City's Ordinance.

So oppressive are the provisions of the automobile speed ordinance just introduced in the Kansas City, Mo., Board of Aldermen that one member of that body felt impelled to condemn it in unmeasured terms.

This was Alderman Greenlee, who protested against the automobile being made a victim of unreasoning prejudice. "I don't see," he said, with considerable vehemence, "why we should legislate an up-to-date pleasure vehicle out of existence. The people who run these machines are not law breakers; they are business men. All of the prejudice against them is the outgrowth of the carelessness of one man. The automobile is an improved and expensive pleasure vehicle. This ordinance carries us back to the speed regulations of the old horse car. If a man cannot travel faster than a dray wagon what use is a vehicle? How would people like it to have twelve-inch numbers painted on their buggies and victorias?"

ONE OF A. L. DYKE'S NO. 1 CARS IN A PICTURESQUE SETTING.

The ordinance is as follows:

Section 1—No person shall ride, drive, run or cause to be ridden, driven or run any bicycle, tricycle, tandem bicycle, automobile, locomobile, horseless carriage or any other vehicle propelled by foot, steam, gas, gasolene or electricity, upon or along any of the public streets, avenues, boulevards, highways or other public places of this city within the following described district at a greater rate of speed than eight miles per hour. A district bounded on the north by Fourth street, on the west by Hickory street, on the south by Nineteenth street and on the east by Cleveland avenue. And no person shall ride or drive, or cause to be ridden or driven any such vehicle upon any public street or highway of this city at a rate of speed exceeding ten miles per hour outside of the district above described, or ride or drive, or cause to be ridden or driven, any such vehicle in such a manner as to come in collision with or strike any other object or person upon the street.

Sec. 2—No person shall ride or drive any bicycle, tricycle, or tandem bicycle as aforesaid in the night without having attached to the front of the same a lighted lamp that can be distinctly seen at a distance of at least fifty feet; and no person shall ride, drive or run, or cause the same to be done, any automobile, locomobile, or horseless carriage as aforesaid in the night without having fixed conspicuously on each side thereof a lighted lamp with plain glass front and side and clearly visible at a distance of at least 100 feet. Said lamps shall be permanently fixed to said vehicle and be carried (not lighted) during the day.

Sec. 3—No person owning or having control or charge of any automobile, locomobile or horseless carriage shall be permitted to drive or run the same upon any public street or thoroughfare of this city unless such vehicle has been registered in the owner's name with the city license inspector, and has the register number painted in red and legible figures at least one inch long upon the front and side of each of the lamps of said vehicle and has said number painted or printed in which upon black background in legible figures at least eight inches in height upon the rear of the bed or body of such vehicle.

Sec. 4—No chauffeur or other person shall run, control or have charge of any automobile or horseless carriage upon the public streets of this city, who is not a duly licensed chauffeur as hereinafter provided.

Sec. 5—It shall be the duty of the Board of Engineers of this city to license such persons as chauffeurs as shall upon examination by said board be found to have the capacity, skill, experience and habits of sobriety requisite to perform the duties of chauffeur. Said Board of Engineers shall grant such license for the same period of time, and in the same manner in all respects as engineers' licenses, except that a fee of $3 shall be charged for each license and a fee of $1 for each renewal thereof.

Sec. 6—Every chauffeur, whenever upon any public street or way and approaching any vehicle drawn by a horse or horses, or any horse upon which any person is riding, shall operate, manage and control such automobile, locomobile or horseless carriage in such a manner as to exercise every reasonable precaution to prevent the frightening of any such horse or horses, and to insure the safety and protection of any person riding or driving the same.

Sec. 7—Upon approaching a crossing of intersecting ways, and also upon traversing the crossing or intersection the person in control of an automobile or horseless carriage shall run it at a rate of speed less than that above specified, and not greater than is reasonable and proper, having regard to the traffic and the use of the intersecting ways.

Sec. 8—Any person violating, neglecting or refusing to comply with the provisions of this ordinance shall be deemed guilty of a misdemeanor and upon conviction thereof shall be fined not less than $1 nor more than $500 for each and every offense.

RECAPITULATION OF THE MONTH'S CASUALTY RECORD

RAILROADS {Killed, 425. Injured, 530.} TROLLEYS {Killed, 64. Injured, 337.} HORSES {Killed, 33. Injured, 336.} BICYCLES {Killed, 1. Injured, 63.} AUTOMOBILES {Killed, 0. Injured, 14.}

THE CASUALTIES OF THE WEEK

RAILROADS {Killed, 148 Injured, 245.} TROLLEYS {Killed, 20. Injured, 105.} HORSES {Killed, 10. Injured, 146.} BICYCLES {Killed, 0. Injured, 27.} AUTOMOBILES {Killed, 0. Injured, 7.}

175 KILLED.——TOTAL THIS WEEK——530 INJURED.

PRIOR TO OCTOBER 20.

Stockbridge, Mass., Thomas Mercer, killed by cars.....Chelsea, Mass., Mrs. Horace Taylor, injured by bicycle.....Brockton, Mass., Nelson Aldrich, fell from bicycle; arm broken.....Lowell, Mass., Joseph Watts, injured by fall from bicycle.....Pueblo, Colo., Eugene Soan, probably fataaly injured by train.....Montreal, Que., Albert Durocher (8), injured by cab.....Montreal, Que., Arthur Cyr, injured by train.....Toronto, Ont., Herbert Stephen (3), injured by wagon.....Omaha, Neb., car struck coal wagon; A. Mathias injured.....Albright, Neb., Willis Brown, fatally injured by train.....San Francisco, Cal., Wm. Bridgeman, fell from bicycle; scalp wound.....Santa Rosa, Cal., Frank Rhoads, injured by fall from bicycle.....Lakeville, Cal., colliscion; Engineer Jodon killed; Fireman Cline seriously injured.....Kansas City, Mo., Frank Albert, struck by trolley; may die.....Rock Island, Ia., T. H. Bivans, struck by train; lost leg.....Champaign, Ill., Martin Herman, killed by train.....Detroit, Mich., Roy Canner (5), injured by train.....Grand Rapids, Mich., George E. Pegg, perhaps fatally injured by engine.....Chicago, Ill., George Rehm, killed on railroad.....Iron Mountain, Mich., Paul Carli, killed by train.....Chicago, Ill., Mrs. Ida Gross, killed by trolley car.....Cincinnati, O., Rudolph Beist, hurt in runaway.....Loveland, O., Mr. Laveston, killed by train.....Marion, O., Thomas Martin, injured by train.....Hamilton, O., Mrs. Catherine Gebhart, killed, and Abraham Williamson probably fatally injured by train.....Crestline, O., Peter Frey, injured by train.....Paris, Ky., three trainmen injured in wreck.....Portsmouth, O., wreck; two trainmen injured.....Lynn, Mass., John Kiernan, killed by train.....Owensboro, Ky., Miss Satterfield, injured by fall from buggy.....Wheeling, W. Va., Engineer Burke injured in wreck.....Braddock, Pa., Mrs. E. Cohan, killed by train .....Johnstown, Pa., Steve Polaz, killed, and another foreigner probably fatally injured by engine.....Hazelton, Pa., Ray Mack, killed by train.....Scranton, Pa., Lizzie Richards (3), injured by carriage.....Keating, Pa., Mrs. Lizzie Kowatt, probably fataaly injured by train.....Erie, Pa., Frank Rilling, killed by train striking carriage.....Sharon, Pa., runaway; two injured.....Pittsburg, Pa., John Lyons (9), struck by trolley; ankle fractured.....Lynn, Mass., two injured on handcar.....Chester, Del., John Brown (14), struck by trolley; may die.....Central Falls, R. I., trolley struck wagon; Thomas Conway injured.....Charlestown, Mass., Wm. Bartlett, injured by fall from bicycle.....Hudson, Mass., Miss Annie Reddy, injured in runaway.....Forest Hills, Mass., Wm. Mullen, fell from bicycle; skull fractured.....South Boston, Mass., Walter Cole (4), injured by buggy.....Lynn, Mass., John J. Fallon, thrown from bicycle; arm broken.....Everett, Mass., Miss Nora Murphy, seriously injured in railroad collision .....South Boston, Mass., Francis V. Foley (9), struck by trolley; arm severed at elbow.....Berlin, Conn., James Doyle, killed by train.....Waterbury, Conn., Mrs. F. U. Higgins and little daughter, injured by wagon.....Ansonia, Conn., John Ewing, injured by fall from bicycle.....Jersey City, N. J., Walter Natton (9), killed by trolley.....Jersey City, N. J., Mary Logan (10), injured by trolley.....Elizabeth, N. J., Harold Meehan (10), injured by trolley.....Hudson, N. J., Nicholas Capone, injured while boarding car .....Buffalo, N. Y., Wm. Walker, injured by trolley.....Waterbury, Conn., trolley and train collision; about twenty injured.....Schenestady, N. Y., Herman Friedman, killed by trolley.....North Tonawanda, N. Y., John Kinzly, struck by trolley; may die.....Watkins, N. Y., John H. Reed, injured by trolley.....West Lynn, Mass., Leo J. Broderick, injured by wagon.....Lowell, Mass., James Daly, injured by fall from wagon .....Pine Valley, N. Y., three trainmen injured in wreck.....Buffalo, N. Y., Michael Sodarski, injured by train.....North Tonawanda, N. Y., child injured in runaway.....Buffalo, N. Y.. Wilfred H. Mills (9), injured by heavy wagon .....Dunkirk, N. Y., Valentine J. Miller, injured by wagon.....Paterson, N. J., Wm. Mercer, injured by jumping from train.....Uniontown, Pa., Jack DeBolt, injured in runaway.....Lower Providence, Pa., Rev. Theodore Heysham, injured by fall from wagon.....Warren, Pa., Miss Frances Gutzler, injured in runaway.....Mahanoy City, Pa., George ONlickney (14), killed by train.....Pittsburg, Pa., two injured in trolley collision.....Pittsburg, Pa., unknown man killed by trolley.....Philadelphia, Pa., two children injured by collision of wagons.....Philadelphia, Pa., trolley struck wagon; one killed and two seriously injured.....Philadelphia, Pa., James Kelly, injured by trolley striking wagon; may die.....McKinney, Tex., James Brannon, killed by train.....Fort Worth, Tex., W. D. Murphy, killed by train.....Ramsey, Va., two killed, one injured in collision.....Cincinnati, O., two men injured in runaway.....Cincinnati, O., two ladies injured in runaway.....Cincinnati, O., Mrs. Wm. C. Lawson, seriously injured in runaway.....Ironton, O., Charles Davidson and Henry Geswine, killed, and Frank Geswine seriously injured by train.....Newark, O., boy injured in runaway.....Cincinnati, O., Harry Morrison, thrown from bicycle; arm broken.....Findlay, O., Reuben Workheiser, injured by horse.....Frankfort, Ind., L. S. Lytle, killed by train.....Deer Creek, Ill., Robert Bogardus, injured by horse.....Wesley City, Ill., Harry Klicker, struck by train; may die.....Chicago, Ill., Mrs. Hattie Keyes and infant, injured by cab.....Leverett, Ill., Vacaro Votisano, killed by train.....Chicago, Ill., Mrs. Paul Gross, killed by trolley.....Menominee, Mich., George Blinkham, seriously injured by engine.....Fort Madison, Ia., Wm. Saunders, seriously injured by engine.....Davenport, Ia., three trainmen injured.....Seattle, Wash., Wm. C. Foster, struck by team; scalp wound and broken arm.....Independence, Ore., Mr. and Mrs. Whiteaker, injured in runaway.....Kalama, Wash., Albert Dray, killed by train.....Janesville, Wis., Frederick Ahlgrim, killed by train.....Sparta, Wis., Fireman Davis, killed, and three trainmen injured in wreck.....Northfield, Vt., Earl Prince, injured by horse.....San Diego, Call., two ladies injured in runaway.....Missoula, Mont., G. Dahlberg, injured by train.....Waterbury, Conn., Mrs. Knickerbocker and Mrs. Ney, injured in runaway.....Corning, N. Y., Merrell W. Cooney, killed by train.....Salt Lake City, Utah., two injured in trolley collision.....Los Angeles, Cal., Albert H. Smith, cyclist, struck by trolley; scalp wound.....Woodstock, Ont., Edward Cuthbertson, killed by train.....Red Cliff, Colo., unknown man killed, two trainmen injured.....Waldoboro, Neb., James A. Trowbridge, thrown from carriage; may die..... Aurora, Neb., Frank Feinster, probably fatally injured in runaway; Fred Jeffers also hurt..... Omaha, Neb., Andrew Svec, killed by train..... ONmaha, Neb., car struck wagon; D. A. Linhart injured.....Manchester, N. H., Claude Tucker, injured by horse.....Beachmont, Mass., Ottie Brogi, injured by cyclist.....Worcester, Mass., twelve injured in trolley collision; two may die.....Millbury, Mass., car struck buggy; John W. Ashton injured.....Taunton, Mass., car struck wagon; child killed.....Worcester, Mass., two men thrown from carriage and injured.....Fresh Pond, Mass., Charles Clarke, fell from engine; may die.....Housatonic, Mass., William Winchell, thrown from bicycle; fractured wrist.....Plainville, Conn., A. E. Grover, seriously injured by fall from trolley car..... Brockton, Mass., motorman injured in trolley collision.....Middlebury, Vt., Marcus Carr, injured in runaway.....Waltham, Mass., Henry J. Leck struck by trolley; may die.....Boston, Mass., Wm. Cullinane (14), injured by runaway horse.....Woburn, Mass., car struck team; driver hurt.....Greensboro, Ga., Price Orr, killed by train.....Gallipolis, O., A. M. Calhoun, injured by wagon.....Jefferson, O., Mrs. Fred Strong and baby, injured by cyclist.....Cleveland, O., trolley struck truck; driver seriously injured.....Perrysburg, O., Frank Roneau and sister, injured in runaway.....Guilford, Ind., train struck buggy; Mrs. Miller and child killed; Mr. Miller may die.....Indianapolis, Ind., bicycle collision; Miss Collins probably fatally injured; Andrew Jackson badly hurt.....Warren, Ind., two injured in runaway.....Lafayette, Ind., several injured in trolley collision..... Chicago, Ill., trolley struck buggy; Armie Schauer (15), killed, and his brother injured..... Chicago, Ill., trolley struck wagon, injuring Martin Aardna.....Pawtucket, R. I., car struck wagon; woman and child injured.....Providence, R. I., car struck wagon, badly injuring driver.....Jefferson, Md., Mrs. Franklin L. Bowlus, thrown from vehicle; arm broken..... OCTOBER 22.

Mineola, L. I., Foxhall Keene and chaffeur, thrown from automobile by axle breaking; not dangerously hurt.

OCTOBER 23.

Boston, Mass., Chester Kelman (10), struck by motor delivery wagon, but not injured.

OCTOBER 24.

New York, Kate McGowan, struck by automobile; slightly injured.....Allegheny, Pa., J. G. Wright, seriously injured by being thrown from automobile.

May Accept New Company's Bonds.

Press dispatches from Middletown, Conn., state that many holders of the bonds of the Keating Wheel & Automobile Co., which has been taken over by the Eisenhuth Horseless Vehicle Co., refused interest checks as acceptance. This would indicate willingness to accept any bonds that the new company might issue in substitution. Local bondholders will not for the present surrender the old Keating bonds.

Recent Incorporations.

Jersey City, N. J.—Daimler Manufacturing Company, with $600,000 capital, to manufacture motors, engines, etc. Incorporators: Otto G. Nestle, J. Henry Mitchell and Alvoni R. Allen.

Cleveland, O.—Star Automobile Company, with $50,000 capital, to make gasolene automobiles. The incorporators are J. H. Vandorn, E. I. Leighton, W. A. Dutton and Frank Schneider.

Augusta, Me.—The American Automobile Company, with $500,000 capital, to manufacture automobiles and mechanical vehicles. The officers are: President, F. I. Dutton; treasurer, E. F. Whittum.

Niagara Falls, N. Y.—Niagara Traction Automobile Company, with $25,000 capital. Directors: W. R. Campbell and F. A. Dudley, Niagara Falls, and F. A. Babcock, Buffalo.

Kittery, Me.—Boulton Automobile Company, with $500,000 capital, to manufacture and deal in automobiles. President, Horace Mitchell; treasurer, John M. Heath.

Bristol, Conn.—The Bristol Motor Car Company, with $10,000 capital, to develop, patent and sell inventions connected with the manufacture and sale of motor vehicles. Incorporators: F. N. Manross, E. R. Burwell and W. L. Newbaur of Bristol, and J. H. Jones and A. A. Geisel of Springfield.

Brooklyn, N. Y.—The Kings County Automobile Club, to "promote the mutual enjoyment of the members in the pursuit of automobiling as a pastime." The directors for the first year are as follows: George A. Needham, Thomas H. Ivery, Charles L. Simms, H. W. Robins and Alexander S. Farmer, of Brooklyn.

No Wind Too Strong for it.

In order to cope with that bete noir of some steam car users, "back firing," the Standard Supply Co., Philadelphia, has brought out what it terms a vacuum smoke cap. It consists of a small glass tube, attached to which are two ingeniously fashioned caps made of tin. It is claimed that with this device, no matter in which direction the wind may blow or how strong, the draft is greatly increased, and the stronger the wind pressure the better the draft; in short, with this device "back firing" is rendered absolutely impossible.

The H. H. Franklin Co., Syracuse, N. Y., expect to have their new factory ready for occupancy by January 1.

It has been decided to hold the annual banquet of the Automobile Club of America on January 24 at the Waldorf-Astoria.

As a result of the application, the case has been set for hearing in the United States Circuit Court of Appeals in Philadelphia.

The Bates-Odenbrett Automobile Company, Milwaukee, Wis., has been organized and opened a store at 501 Broadway. The Winton and other cars will be handled.

An automobile, said to be valued at $10,000, belonging to H. Holsman, was stolen in Chicago on Monday. The thief stepped into the car, threw the clutch in and rode off.

The Diamond Automobile Co., Wilmington, Del., is in the hands of the sheriff. The concern was recently incorporated with a capital of $100,000, but very little work had been done.

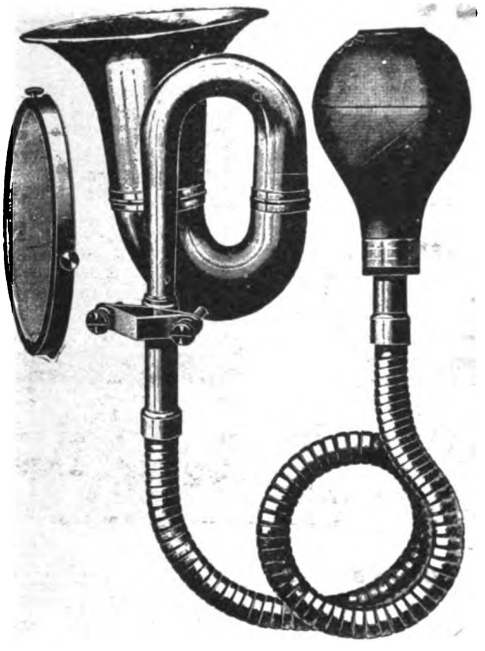
Acting upon complaints that have been made regarding undue speeding of automobiles, the Utica (N. Y.) police have announced that they will hereafter arrest any violators of the State law.

About a dozen cars filled with members of the Automobile Club of Maryland were driven from Baltimore to Frederick, Md., and return, 4 miles each way, last week. They had a most enjoyable trip.

It is claimed that a Panhard car was last week driven from Great Neck, Long Island, to Philadelphia and return, 268 miles, by its owner, George Arents, jr., in 11 hours actual running time.

Automobilists, as such have found their way into politics. Last week the New York Electric Vehicle Association, composed principally of operators of cabs in this city, indorsed one of the judicial candidates.

After covering 5,125 miles in his Napier car, Charles J. Glidden has reached his home at Lowell, Mass. With a party of friends Mr. Glidden toured in France, Belgium, Germany, Austria, Italy, Switzerland and England.



Attention has been attracted in Peru by the arrival of two automobiles, one burning coal and the other petroleum, at Cerro Pasco from Tambro, Col. They covered 100 kilometres in 36 hours, and carried 10 tons of cargo.

A test of the patrol wagon which the Electric Vehicle Company built for the Atlantic City, N. J., police department, was made last week. The wagon developed a speed of 14 miles an hour and was also satisfactory in other respects.

"The Blue Assassin" is the grewsome name that an imaginative Hartford (Conn.) reporter has given to the new Apperson car purchased by George M. Brown, of that city.

Latest French Horn.

The latest style in French horns is shown in the accompanying illustration of Miller's No. 4, which is being imported by Charles E. Miller, 97 to 101 Reade street, this city. This horn is fitted with forty inches of exible metallic tubing, with one bracket for attaching to the front of the car and another bracket for attaching bulb to steering lever. It also has a sieve or screen over the bell. This horn is one of 28 other sizes, all of which are carried in quantities to insure prompt shipments.

Mr. Miller is a large importer of everything in automobile sundries and novelties, and has a representative in France that his goods may always be up to the minute in design, price and deliveries.

It takes its name from "its powerful appearance and royal blue coloring," it is added.

In a resolution passed by the board of governors of the Automobile Club of America on Monday the Knox Automobile Co., the . Stevens Arms & Tool Co., and the Massachusetts Automobile Club were thanked for the courtesies extended the participants in the recent reliability contest.

The recently organized International Wheel, Tire & Rubber Mfg. Co., New Brunswick, N. ., has purchased the old factory of the New Brunswick Rubber Co. and expects to begin to operate it within a very short time. The company will manufacture automobile and carriage tires on which it holds patents.

It is stated that 36 motor vehicles were used by the two army corps during the recent German manœuvres. Twenty of the vehicles were for the transport of officers and intelligence service, and 10 were transport trolleys, besides several Thorneycroft trucks and Fowler road engines, which did excellent service.

So successful has the experiment of adapting a motor to an ordinary London fire engine proved that it has been decided to convert several other engines into automobiles. In these cases, as in the one recently experimented upon, the motor will be located in the centre of the vehicle, beneath the seats of the firemen.

A speedy convalescence is the pleasant prospect held out to A. C. Bostwick, whose serious illness, caused by operations rendered necessary by abscesses forming in his nose, was chronicled in these columns last week. Mr. Bostwick is still confined to the private hospital where the operations were performed, however.

The Albany (N. Y.) Automobile Club held its annual meeting last week, and the reports submitted showed it to be in a flourishing condition. The following officers were elected: President, William E. Milbank; vice-president, Grant Newcomb; secretary-treasurer, Charles M. Page; board of governors, Oliver A. Quayle, Joseph B. Taylor and F. G. Robinson.

Laying aside for the nonce their devotion to the horse, Frank Work and a party of equally "horsey" friends took their first automobile ride last week. The host was John A. Drake, who drove his new Panhard, and his guests were, in addition to Mr. Work, David Bonner, E. R. Ladow, president of the Leather Trust, and Hamilton Busby, of Turf, Field and Farm.

At the annual meeting of the Wachusett Automobile Club of Fitchburg, Mass., held last week, the following officers were elected: President, Charles F. Putnam; vice-president, A. H. Pierce, of Leominster; secretary, Levi H. Greenwood, of Gardner; treasurer, G. P. Grant, Jr.; auditor, F. O. Hardy.

The committees were continued as made at the time of organization.

The Congress of the Automobile Federation of the Southeast of France for 1902 will be held at Marseilles toward the middle of November next. The congress held at Nice in October, 1901, had fixed the date for the early days of October, but with common accord, and to give the necessary time to the secretary to convoke the clubs and to prepare the agenda, the date was delayed until November.

BURNS CRUDE PETROLEUM

Marked Success Attends Tests of Hydroleum System—Cost Enormously Reduced.

"To say that anything will revolutionize a trade' nowadays is to stamp it with suspicion. The term has come to be a byword for harebrained inventions. Yet we are tempted to use it as a fair description of what the introduction of the 'Hydroleum' system may mean to the steam car," says the Motor Car World.

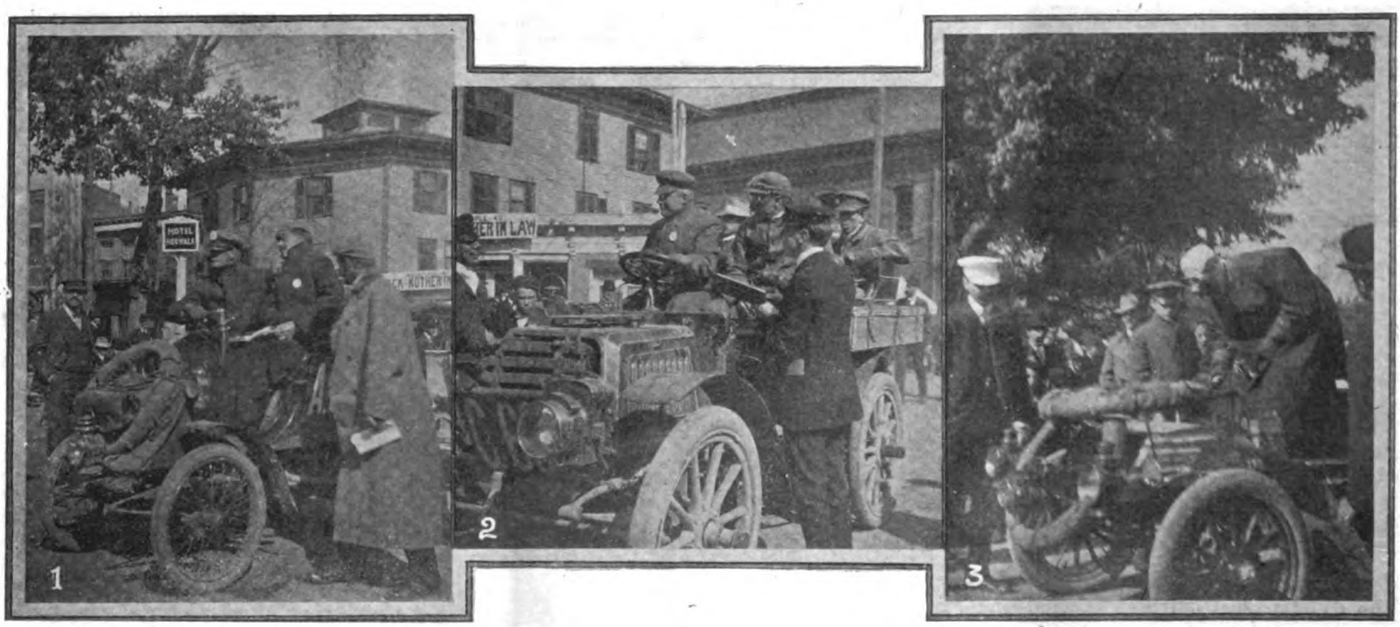
"The application of the hydroleum system to motor cars has solved, it is claimed, the problem of effectually and economically burning crude liquid fuel. The feeder has two inlets—that furthest from the nozzle being for the oil supply, and the other being connected with the boiler for the supply of steam. The oil is discharged from the centre of the nozzle, at atmospheric pressure, the supply being regulated by placing the reservoir slightly lower than the outlet nozzle, so that a proper quantity is drawn at any speed. A needle valve also regulates the supply of oil. The reservoir is really a float chamber, to which there is a gravity feed from the oil tank. From this chamber the oil is drawn into the feeder by the suction caused by a vacuum produced by the issuing steam.

"Surrounding the oil outlet, but at the base of the cone, and therefore behind the oil supply, is an aperture from which the steam emerges. Together, oil and steam are directed to a dash-brick, of special size and location, between an enveloping passage of refractory material, proportionate in size to the dimensions of the feeder employed. The whole of the vapor is thus kept together until it fires on the dash-brick, and this concentration of the vapors, with the small area of the brick, allows the latter to rapidly become sufficiently heated to decompose the vapor into its component gases; these, after leaving the brick, reunite and give out heat in the main combustion chamber

"The steam generator, which is of the water tube type, gives increased heating surface and compactness, coupled with a decrease in weight, but the principal point in the boiler, from a quick steaming point of view, is that the heat is made to run parallel with the tubes, instead of across them. This is accomplished by inclosing the tubes in a flue of refractory material, running from the feeder to the point of exit.

"The engine is simple, of the single cylinder type, but it can be worked high pressure or compound, if required, say, for starting or whenever considerable power is required for short periods.

"It is in the economy of fuel, and the use of the cheapest fuel, however, that the hydroleum system will most appeal to the motor car public. The crudest and cheapest oils obtainable are sufficiently good, and on this point and some others connected with the actual working G. H. Green, who has been installed as manager of the company, says:



" 'The cost of driving a steam car at present may be set down at from 3 to 4 cents a mile. We shall reduce that to not more than a quarter of a cent. The oil used is a crude mineral oil, which we propose to supply in quantities at 4 cents a gallon. We find in practice with a 6½ horsepower motor carrying four passengers that the average quantity required is under two gallons for 30 miles. This, at one cent a gallon, means a cent a mile. For customers' convenience we also propose to put this oil up in convenient tins for carriage by rail and on the car. There are absolutely no obstacles to the use of this oil from an inflammable point of view. No license is needed to keep it, for, as crude mineral oil, it does not come under the regulations. It is perfectly non-explosive, and, commercially speaking, it not burnable, if I may coin a word.

" 'We propose to make the fitting of existing cars our first business, and are preparing ourselves for this work. The alterations we make are to do away with the existing burners, fix our own feeder and a combustion chamber, alter the present gasolene tanks, placing our own oil tank high enough to allow a gravity feed to the float chamber which we supply, and which is placed below the feeder. The cost of conversion of a car depends on the horsepower, but a 5½ horsepower car, for instance, would cost about $150 to convert.

" 'We shall supply complete sets for building with the car, but for the first few months, at any rate, we anticipate that the bulk of our work will lie in conversions.'

"The noise of the burner is slight and scarcely distinguishable, in easy running; opened for a long hill the noise becomes more pronounced, but is still less than that of a gasolene car and unobjectionable. The time taken to light up is practically nil if the boiler is already under steam, but if cold it takes from four to twenty minutes, according to the type and size of boiler.

"Experiments with boilers have given working pressure within a quarter of an hour. The feeder is lit by the application of a 'torch,' i. e., a small wad of asbestos, waste or the like, dipped in a little paraffin. Once the apparatus is properly adjusted there is neither smoke nor smell; adjustment is easily done, and once done it does not require to be touched again for a long period. Experiments and steady use have shown that there is no difficulty in increasing the

READY FOR A JOURNEY. L. D. FISKE (AT THE WHEEL) OF HARTFORD PREPARED FOR TIRE TROUBLES.

Digitized by Google

pressure of steam or the rate at which the steam is generated.

"In fact, the arrangement is such that the system is automatic—when the maximum boiler pressure is reached the feeder is automatically cut out. As pressure increases the feeder is more and more put on. The fundamental rule is that the more steam supply the more oil is sucked."

Buys English Storage Battery Company.

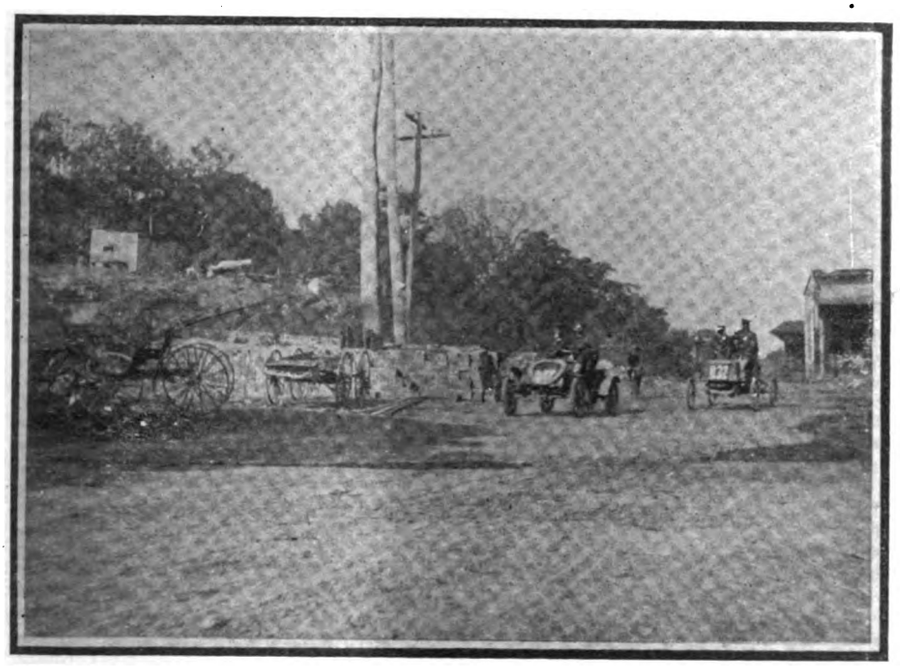
An important deal has just been made, whereby the Electric Storage Battery Company, Philadelphia, acquires the effects of a concern doing a similar business in England. Confirmation of the matter is furnished by C. H. Reed, registrar of the company, in the following statement:

"Soon after the incorporation of the Electric Storage Battery Company in Philadelphia a company was formed in England, under the name of the Chloride Electrical Storage Syndicate, Limited. The company only recently reached a dividend paying basis.

"That a vast amount of electrical work is to be done in Great Britain in the next few years is shown by the very large works put up by the British Westinghouse Companpy and the British Thomson-Houston Company, in Manchester and Rugby.

"The Electric Storage Battery Company, seeing the opportunity for a large and profitable business, not only in England, but in other countries, where the low price of labor and material existing in Europe makes it impossible to compete with storage batteries manufactured in America, decided to purchase control of the English company. This has been done on a satisfactory basis, so that the Electric Storage Battery Company will now realize large profits from the English business, and will also be able to sell batteries in foreign countries and have shipments made from England, and thus be in the very strongest possible position to handle the bulk of the business of the world."

THE STRENUOUS LIFE



Is the Cause of the Prevailing Mortality—Price Paid for Progess.

"Statistics quoted in the Insurance Press indicate a very great increase of deaths by accident, amounting last year to nearly 9 per cent of all the deaths in this country, or more than twice as large a proportion as deaths from old age, and in the way of disease only excelled by deaths from tuberculosis, pneumonia and 'heart failure'—the last a vague term, which often signifies nothing of cause," remarks the Pittsburg Post.

"It is an increase to be expected with the constantly growing complexity of civilization, multiplying dangers, the constant drift of population to the cities, where causes of accident most abound, and in a measure also to the larger invasion of the country regions with the instruments of danger, such as electric wires, trolleys and automobiles. There is no doubt of the great increase of accidents, and especially fatal accidents. It is one of the prices we are paying for our progress, and the prevalence of the hustle line of life.

"We do not believe there is a city in the country where accidents occasioned primarily by the stress of industrial life are more numerous than in Pittsburg, and in greater excess, considering the proportion of population. In the first place the pressure of life, in industry and business, is as great, if not greater, in Pittsburg than elsewhere, and in the next, the avocations pursued in our industries are what are known as extra hazardous, especially when under high pressure. It extends beyond the field of industries, these fatalities. The great increase of suicides has been noticed by all observers the last few years. Then even homicides have their relation to the rush of business and the overtaxing the balance wheels that guard human life. The terror at Homestead is an illustration, and the increase of homicidal crime carries its lesson.

"We are living in the seething and boiling period of human endeavor and individual competition, and the penalty is exacted. Human life, with all our progress, is not so well protected. Enterprise has stimulated recklessness. Human life is cheaper than ever before, save in periods of great wars."

WHERE HORSES, AUTOMOBILES AND BICYCLES MINGLED.

One Delusion Dispelled.

"There is one point I think that this run has demonstrated, and that is the care and consideration of the highway by the contestants," Chairman Scarritt of the reliability contest committee is quoted as saying. "Sixty-eight cars made the trip over the most frequented roads from here to Boston, and started but one runaway, and this was not our fault. The driver confessed that his reins were old and not strong enough to hold his horse, and that they broke at his first pull.

"It was impossible for this train to go through so thickly a populated community without damage unless great care had been exercised. The trip shows what can be done, and it will be urged as an example of the care used by our drivers when the matter of legislation is taken up by the national association. This association expects to have radical and uniform legislation passed in the different States to enable drivers to run from one to another under uniform rules.

"As it is now, when a driver wishes to go from Cleveland to Boston, for instance (as has been frequently done), he has one rule to observe in Ohio, another in New York and still others in Connecticut and Massachusetts. He must familiarize himself with the statutes of the different States and provide no end of signals and numbers for his journey. We think it only fair for the automobilists, as well as for all other users of the highway, to have uniform rules for all States, and this we hope to bring about.

"The care with which this run was made will be an argument, I think, in favor of legislation for the automobilist."

Praise for the Mecaniciens.

The suggestion is made that the mécanicien of a motor car should receive some recognition for his services. A correspondent of the Auto Velo puts it this way:

"You glorify the drivers. Nobody grudges them this. It is their due. But they alone are mentioned and praised. Why don't you give similar credit to the mecanicien who adjusts and trains the motor to racing condition and victory; the man who trusts his life in blind confidence on the racing day to the driver of the car?

The Bristol Motor Car Co., Bristol, Conn., will at once begin work on its first vehicle, and it is expected that it will be ready by January 1.

TREATED WITH OIL

Section of English Road is Subjected to Exhaustive and Successful Experiments.

Remarkable success has attended the systematic treatment with oil on an English road. A division of the road into three sections was made, on each of which the oil was sprinkled in varying quantities. One section received several heavy "coats," another was sprinkled very lightly, while on the third the roadway was first swept and watered and then well sprinkled.

Ordinary watering carts were used for distributing the oil, but as the sprinkling was somewhat irregular the use of ordinary watering cans were requisitioned to cover neglected spots.

The "oiling" occupied a part of each day on September 26 and 27 last, and the result of the experiment, so far as could be ascertained in the short period extending to Saturday last, is highly satisfactory.

Two cars were sent over the ground at very rapid speed without raising the slightest speck of dust, but immediately on reaching the ordinary road surface they were enveloped in a white cloud which completely hid them from view.

The test was exceptionally severe, from the fact that the macadam surface is laid on the Bagshot sand, which makes a very weak foundation. The road is the most dusty in the country, partly owing to the sand working through the macadam, and partly to the heavy traffic, this being the main road to Winchester and Southampton.

The surface is composed of well rolled in Cherbourg quartzite, and the particular section now under the oil "treatment" was repaired last year at a cost of £800.

A careful record is being kept of the cost of the labor, of scavenging and keeping in repair the oiled section, and a piece of the ordinary roadway of equal length adjoining, so that a comparison may be made of the relative cost of oil and water.

The oiling cost, roughly, about $125 per 1,000 yards, and altogether 2,760 gallons of petroleum of a specific gravity of .92 per cent were used.

The oil—which measures 240 gallons to the ton—cost about $9 a ton at the wharfside in London, but its entire cost, delivered at Farnborough, was probably nearer $12.50 a ton.

The oil quickly soaked into the road and left a well knit and firm surface. Even shortly after laying it was not in the least sticky, and in a few hours the smell, which many persons thought would be an effectual barrier to its use for this purpose, wore completely off—no trace of it was discovered by Saturday's visitors.

Contrary to expectation, the traffic had not to be shut off during the sprinkling, and no harm was occasioned, or is likely to be, to the dress of any passersby.

The seven days' trial of the oil has demonstrated several facts, of which the following are the most interesting:

1. That three-quarters of a mile of road surface 23 feet wide requires 11 tons 10 hundredweight, or about 2,760 gallons, of petroleum to properly oil it.

2. That a surface that has been swept beforehand gives the best results.

3. That better distributing apparatus will have to be used, the water carts being too uneven in their action. A spraying machine that will throw with force and evenness will probably be introduced.

4. That the slight smell while the oil is being applied is not unpleasant, and passes away in a few hours.

5. That so quickly is the oil absorbed by the surface of the road that pneumatic tired vehicles can pass over it within a few hours of its being sprinkled without sustaining any damage whatever.

6. That the oil makes the roadway almost a silent highway, the noise of vehicular traffic being deadened to a remarkable extent.

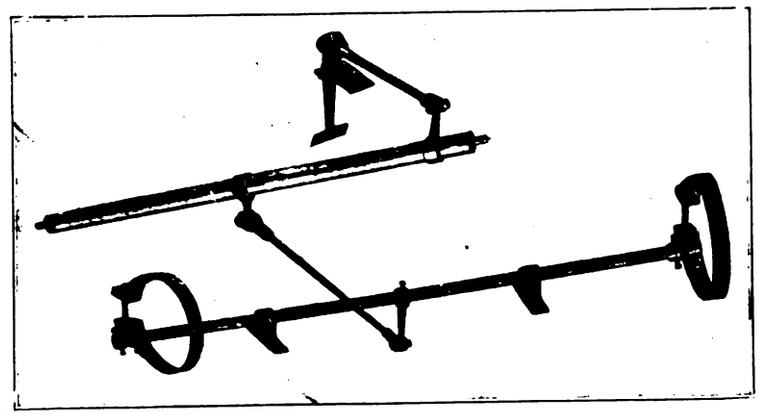
7. That the pleasant brown color produced by the oil is far less trying to the eyes than the white glare of the ordinary dusty surface.

As to the fear of the motorist that his tires may be injured by contact with the oiled surface of the road, it is interesting to note that the oil used for road sprinkling is residual oil, i. e., that which is left after the distillation of the lighter oils has taken place, and is absolutely harmless to india rubber tires, as it is only the lighter oils which injure rubber, acting, as they do, as a solvent.

The sweepings are to be weighed and measured, so as to compare them with those of the non-oil treated section.

One thing that has caused surprise has been the immense quantity of horse droppings, which show rather distinctly on the road surface, and are an eloquent testimony to the superiority of the motor over the horse from a sanitary point of view.

Foot passengers have been so much impressed with the linoleumlike surface of the road that they are anxious to have the gravel footpaths oiled, and this may form the subject of another experiment.



There is no danger of side slipping on the oiled surface, and mud is as scarce in wet weather as dust in dry, for the reason that the rain runs off into the gutter like water off a duck's back.

Not Fined for Loafing.

Whatever John W. Gates, the Chicago steel magnate, does, he does with his whole heart. Consequently it is not surprising that reports of his exceedingly strenuous automobiling trips should have shown that he has on more than one occasion run afoul of the authorities.

On his return from abroad last week Mr. Gates thus unburdened himself to reporters:

"I went away for a rest and got it. I did a lot of automobiling, and I bought a 45 horsepower Mercedes, which I am bringing over with me."

BAND BRAKE ATTACHMENTS.

"Is your new auto a fast one, Mr. Gates?"

"You didn't read anywhere that they fined me for loafing, did you?" he replied.

Mr. Gates also purchased two automobiles which he intends to use next year, and the machines are now on their way over.

Band Brake Attachments.

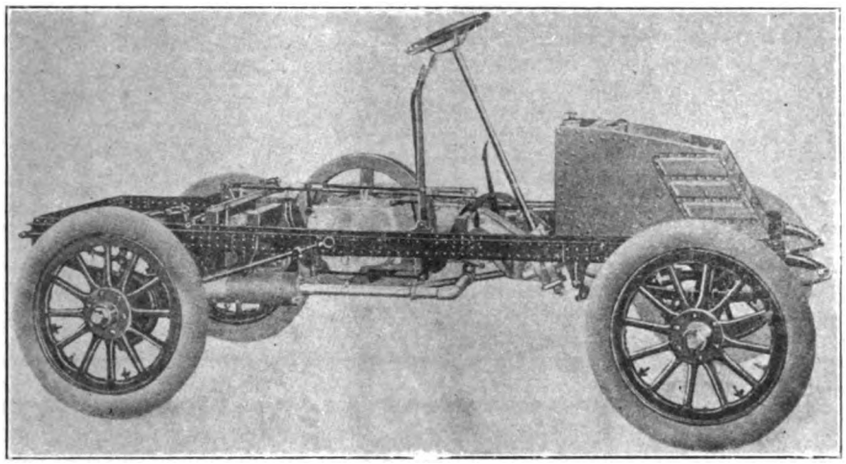
For use in connection with their artillery pattern wood wheels the Neustadt-Perry Co., St. Louis, Mo., have just gotten out driving sprockets and castings for double acting band brakes fitted on the wheels. The attachment is made to accommodate a sleeve in connection with the rear axle, as shown. The double acting band brake attachments are made on the eccentric principle, together with levers and all necessary attachments for operation in connection with the wheels.

Cheap at the Price.

Twelve hundred hares were killed to produce a coat made entirely of hares' ears shown by a London furrier. It took three months to manufacture, one man being employed three days in cutting the ears from the skins. It has been specially treated to render it waterproof.

Considering the immense amount of labor spent on it, it seems cheap at the price, $100, which is asked for it.

A speed and endurance test, to take place next month, is talked of by members of the Hudson County, N. J., Automobile Club.



Digitized by Google

Winton's New Features.

When the present Winton touring car made its appearance a year ago it is quite within bounds to say that it created a sensation. It was such a radical departure from former Winton designs, and withal such a distinct advance, that it was hailed with acclaim by friends and examined with respect by competitors. The subsequent career of the car, its instant and tremendous success, is now history.

The 1903 Winton touring car, the chassis of which is shown, is a worthy successor to its predecessor.

It follows the lines of this year's car as a whole, but it has been vastly improved in a dozen different ways. Instead of 15 horsepower, the motor will generate 30. It is of the double opposed type, with an actual increase of 33 per cent brake test horsepower over the 1902 type. The numerous improvements along general structural lines will insure greater efficiency and simplicity throughout.

ASSEMBLED RUNNING GEAR OF THE 1903 WINTON.

The new body in design, materials and workmanship will represent a radical departure from the 1902 type. It will be luxurious to a degree. There will be a division in the wide front seat and the tonneau will comfortably seat three passengers. No expense or skilful effort has been spared in the matter of designing and executing the finest body ever made part of an automobile equipment. The chief aim has been to insure greatest comfort to passengers who occupy either the front or tonneau seats, and it is believed that the efforts in this direction have been entirely successful. Deep spring upholstery will mark one important change. In this connection the seats and backs will be alike.

The spring suspension of the new touring car is another point which must not escape mention. Springs will be much longer, wider and more elastic, made from a special spring stock, and it is believed that there is no longer a possibility of spring breakages even though the service be severe.

The price of the new car complete will be $2,500, and in the matter of real value it will be a better "buy" than the 1902 model at $2,000. In the matter of body construction alone this increase over the price of the 1902 touring car is more than accounted for, to say nothing of the elaborate and expensive improvements made upon motor and running gear throughout.

Exclusively for Automobilists.

No golfers or tennis players will be invited to join the Buffalo Automobile Club. That was decided at the annual meeting of the club, held last week at the Niagara Hotel.

The question came up before the club during the consideration of the advisability of building a clubhouse. George S. Metcalfe submitted a report from the committee on house and grounds which took up the question of purchasing a site and clubhouse, and suggested the name of the club be changed to the "Automobile and Outing Club." His idea was to increase its members by taking in golf and tennis players. He thought the club would then be in a better position to maintain a clubhouse.

The suggestion raised a storm of disapproval. Edward H. Butler and Dr. T. J. Martin both arguing that Buffalo was large enough to maintain a club exclusively devoted to automobiling.

Officers elected by the club for the ensuing year were: Ellicott Evans, president; H. A. Meldrum, vice-president; John M. Satterfield, secretary; E. R. Thomas, treasurer, and George Metcalfe, member of the board of governors.

Give Clutches Attention.

Clutches do not always receive the attention they deserve. They are allowed to become oily, so that they slip unduly, or the spring holding the clutch to its work is left unadjusted so long that a lot of power is wasted and speed lost. Whenever the engine seems to be going at a good speed and the car going slowly for the gear in operation, it may be assumed that loss is taking place, and that the clutch wants attention. It will generally be found that the clutch is quite hot—perhaps unbearably hot—to the touch.

Melts at 180 Degrees.

The Jos. Dixon Crucible Co. has been at some pains to ascertain the best form of a graphite suitable for the chains of motor cars. At first it was thought to provide a pan containing a hard graphite lubricant, the idea being to put the pan on a stove and when the lubricant had melted sufficiently to immerse the chain, which had previously been cleaned.

After the lubricant in its heated condition had thoroughly penetrated all the bearing points, the chain was to be removed, wiped comparatively dry, the pan removed from the stove and on cooling the lubricant would harden to its original condition. On looking around for information relative to the proper size for such a pan the company found that chains vary so greatly that they would be obliged to have large pans ranging from 12 inches to 2 feet in diameter. This idea was therefore abandoned, and they have now brought out a chain lubricant in pails.

The lubricant is not quite so hard as they desired to have it, but the idea now is that the owner of the motor car shall obtain a pan of the required size, put as much of the lubricant in it as he desires, melt it and then follow the methods outlined above. The reason given by the company for adopting a hard lubricant is that as it cools on the bearings of the chain it makes a better bushing than anything soft could possibly make; also one not liable to so readily retain dust and dirt. They are therefore putting up the lubricant in a cake which will melt at about 180 degrees Fahr.

Discrimination Against Autombiles.

A plea for better treatment of automobilists is made by Leopold de Rothschild. "I venture," he says, "as an old roadster to ask for that consideration toward motor drivers which is called in common parlance the courtesy of the road.

"There is a camraderie among all coachmen, which enables the vehicle to thread its way through the intricacies of a crowded street. At the present moment the motor car is somehow or other looked upon as the common enemy by coachmen, cyclists and pedestrians alike. I cannot help thinking that it would be a great mistake to allow this feeling of irritation to increase, because motors have come to stay, and they are not merely rich men's toys.

"There is no doubt that the large cars, from 12 to 40 horsepower, are only available for those possessing large means, but the smaller cars are of the very greatest service to country professional men whose business takes them 20 or 30 miles round their homes. As an industry, already the building of motor cars means the employment of many men, and as the sales of English made cars are daily increasing, more hands will be wanted at the factories. More men will also be wanted as chauffeurs, and they must be men possessing some knowledge of engineering."

Need not Pay Toll.

There is now a good prospect of automobiles being able to reach the Manhattan Beach Hotel without having to pay a toll of 25 cents for tooling over the short strip of road leading to Emmons avenue, Sheepshead Bay, to the hotel. Comptroller Grout of New York decided on Monday that the Manhattan Beach Land and Improvement Company has no right to exact a toll and directed the Corporation Counsel to begin proceedings to enforce the rights of the city. The decision of Comptrolled Grout was based, he said, upon the Manhattan Beach Company having appropriated 285 acres of land belonging to the town of Gravesend and the alleged private road on which the toll was charged is built across this land.

The fight to abolish the toll was begun last August by Borough President Swanstrom of Brooklyn, who was held up while going to the hotel in an automobile and made to pay a quarter. President Swanstrom expressed the sentiments of many others when he promptly characterized the mulcting process as "a petty imposition" and declared that he would put a stop to it.

Supports six Miles Ordinance.

Director Leslie, of Pittsburg, Pa., has some peculiar ideas. In supporting an ordinance which he was instrumental in having drawn, and which provides for maximum speeds of six and ten miles an hour for automobiles, he said that it might not be necessary to rigidly enforce the minimum on some of the East End thoroughfares, but he wanted the law broad enough to uphold the police when they found it necessary to make arrests.

The ordinance which limits the speed of automobiles to six miles an hour downtown and ten miles in all other parts of the city was recommended affirmatively to Councils by the committee on public safety. Councilman Lamb wanted to have the limit raised to 20 miles on the boulevards, but his amendment was lost.

America of America.

A souvenir of its European trip is a small sign which is still attached to the rear of the Winton touring car owned by Harry D. Corey, of Boston.

"When we got to Belgium we found that it was necessary to have the car marked as coming from this country," said Harry A. Fosdick to the Motor World man in explanation. "So the Belgian Automobile Club, to whom we carried letters from the Automobile Club of America, undertook to fix us up. This was the result," and he pointed to the sign, which read:

"They thought this was all right, so out of politeness we let them continue to think so."

New De Dion Car From Paris.

A small car is being prepared by De Dion-Bouton for next season's trade. It is a 6 h.p. voiturette, with the engine placed in front under a bonnet, and, broadly speaking, the machine may be described as a reduction of the well-known 8-9 h.p. De Dion. It provides comfortable seating for two, and no provision is made for the attachment of a dickey or a stumpy tonneau, as is sometimes the case with these small cars, the idea seeming to be to produce a thoroughly comfortable, speedy and handy sociable.

Two positive speeds are given, the lower being nine and a half miles per hour, and the second much above ordinary requirements. The total weight is just under seven hundredweight. The springing is exceptionally easy, the rear axle being carried further back than usual, and it has half elliptical springs connected to the tubular frame by means of inverted C springs. The front axle is also thrown well forward, and altogether the little vehicle looks as though it would meet the requirements of a large number of people.

The Week's Exports.

The Week's Patents.

711,481. Storage Battery Plate. Nathan T. Daboll, New London, Conn. Filed Feb. 19, 1902. Serial No. 94,735. (No model.)

Claim—1. A storage battery plate consisting of wire gauze coated with finely divided carbon, and this in turn covered with white lead.

2. A storage battery plate consisting of a mattresslike case of wire gauze stuffed with finely shredded metal and coated with finely divided carbon, covered on the outside with white lead.

711,520. Electric Motor for Vehicles. Harry G. Osburn, Hoboken, N. J. Filed May 6, 1901. Renewed March 17, 1902. Serial No. 98,455. (No model.)

Claim—1. In an electric vehicle, the combination with an axle, of a wheel journalled thereon and having a laterally extending hub, the stationary element of an electric motor carried upon the frame of the vehicle and the rotatable element of the motor supported on the hub of said wheel and secured to the outer portion thereof, substantially as described.

711,546. Water Tube Boiler. John E. Thornycroft, Chiswick, England. Filed June 18, 1901. Serial No. 64,983. (No model.)

Claim—1. In a steam boiler, the combination with a steam and water vessel, of a plurality of steam generating elements each comprising two sets of groups of tubes inclined to one another and a junction box common to both sets or groups of tubes and connected to the converging ends thereof, and means connecting the diverging ends of the tubes of each element to said steam and water vessel.

711,592. Running Gear for Vehicles. Frank Schmitz, Chicago, Ill. Filed March 5, 1902. Serial No. 96,740. (No model.)

Claim—1. In a running gear, the combination with a rigid quadrangular frame, of four wheels connected thereto substantially at the corners of said frame, and separate springs adapted to exert independent downward thrust on the several wheels with respect to said frame; substantially as described.

711,606. Steam Engine. Paul H. White, Indianapolis, Ind., assignor to White Steam Wagon Company, Indianapolis, Ind., a corporation of Indiana. Filed Oct. 3, 1901. Serial No. 77,376. (No model.)

Claim—1. In an engine, the combination of a boxlike body, a crank shaft extending therethrough, a pair of high pressure cylinders, a pair of low pressure cylinders, two of said cylinders being arranged upon each side of the crank shaft and secured to said body, pistons mounted in said cylinders, connections between said pistons and crank shaft, valves for controlling the passage of the motive fluid to and from said cylinders, valve gear mounted inside of the body and connected to said valves, and means for closing said body so as to inclose the working parts of the engine.

711,652. Sparking Mechanism for Gas Engines. Ernest S. Bowen, Auburn, N. Y., assignor of one-half to Walter L. Fay, Auburn, N. Y. Filed July 5, 1901. Serial No. 67,108. (No model.)

Claim—1. In a gas engine sparking mechanism, the combination with the terminals suitably supported and suitable electric connections thereto, of a speed controlling lever suitably journalled, an igniter cam journalled on the speed controlling lever, means to rotate the cam and intermediate connections between the cam and the terminals to force their separation and thereby cause the spark.

711,675. Vehicle Construction. Edward H. Phipps, New York, N. Y., assignor to Phipps Road Car Company, a corporation of New Jersey. Filed Feb. 8, 1902. Serial No. 93,264. (No model.)

Claim—1. As an improved article of manufacture, a vehicle axle comprising similar end sections having reduced meeting portions which slide one on the other, a sleeve inclosing the said overlapping sections, and a bolt connecting the sleeve and the overlapping axle parts.

711,710. Storage Battery. Daniel E. Wiseman, Chicago, Ill., assignor of two-thirds to W. W. Vance, Ottumwa, Iowa, and Charles V. Aspinwall, Chicago, Ill. Filed March 12, 1901. Serial No. 50,884. (No model.)

Claim—1. A storage or secondary battery consisting of two electrodes immersed in a suitable electrolyte and inclosed in a suitable cell, said electrodes being supported upon rods fixed in the cell, said electrodes being composd of a conducting strip or ribbon being bent back and forth upon itself in serpentine form, and said strip or ribbon having a series of depressions produced therein to receive active material.

711,917. Storage Battery Plate. Edward H. Winkes, Buffalo, N. Y., assignor, by mesne assignments, of one-half to the American Motor Carriage Co., Cleveland, O., a corporation of Ohio. Filed April 25, 1902. Serial No. 104,622. (No model.)

Claim—1. A storage battery plate comprising a supporting frame and a length of sheet lead folded or corrugated and cut into numerous closely spaced and partially separated strips freely accessible to the electrolyte, said sheet being inserted in, and united with the frame, the folds or corrugations being transverse to the frame, substantially as set forth.

DESIGNS.

36,116. Lamp Body. William Gray, Amesbury, Mass. Filed September 3, 1902. Serial No. 122,014. Term of patent seven years.

Claim—The ornamental design for a lamp body, as shown and described.

Two Motor Garments.

Two articles designed especially for women automobilists have made their appearance. They are the "Adele" combination mask and wrap and the "Desirée" combination mask and hood.

The former refinement has an ample sight piece of clear fine mica firmly attached to the face shape of silky net, which allows unimpeded vision with free respiration and ventilation. The Japanese silk wrap (in any desired tint) is fastened firmly to both mica and net, and by an ingenious and simple arrangement of elastic and ribbon is drawn around the hat and pulled together in "gathers" at back and front of the neck. The front gathers are so arranged that they can easily be loosened for the use of the handkerchief, without any disarrangement of the wrap.

The "Desirée" hood is made with the same combination of mica, net and silk, and covers hat, head and face completely, preventing the powdering of the hair, etc., by the dust

brought into the back of the car by the following draught. The hood is easily attached by four small buttons placed up the side, and has the same ingenious arrangement of draw silk as the "Adele" wrap. Either wrap or hood is made in neutral shades of silk, viz., pale fawn, dust color, French gray, white or steel gray.

A Mistaken Policy.

"How shortsighted some makers are!" remarked an enthusiastic automobilist to the Motor World man. "I was looking at a famous foreign car the other day with the intention of purchasing it when I found that the brakes were single acting. They would not hold the car backward, the only protection in case a chain broke or something else went wrong being to drop the sprag. I immediately gave up all thought of that car and went to another establishment and paid $5,000 for a car of another make. Wouldn't you think the concern referred to would remedy such a little thing as that?"

Knows a Good Thing.

That George C. Cannon knows his book thoroughly will be generally admitted. He is a firm believer in the superiority of the steam car, and of the fire tube boiler. The boiler used in his racing car, which was made by the Steam Carriage Boiler Co., Oswego, N. Y., is declared by him to give better results than could have been obtained with any other. It has never failed to meet the demands made on it, he says.

THE FORD-COOPER RACER

MAKES A WORLD'S RECORD ON

G&J TIRES

The Ford-Cooper Racer, driven by Barney Oldfield, at Detroit, October 25th, made a new world's record for five miles on a circular track in competition. Time, 5 min., 28 sec.

G & J TIRE CO., DETROIT, MICH., October 27th, 1902.
Indianapolis, Ind.

GENTLEMEN:—In reference to the automobile tires I ordered from you to be placed on my racer, I wish to state that the tires were placed on the machine the first of last June and have not had to pump them up since that time.

The machine entered the last races held here on the Grosse Pointe Track, October 25th, and being on the track with five other machines, it had to make some very sharp turns while passing some of the slower machines on the curves. The tires held the curves very well for such high speed.

The machine broke the world's record, on a circular track, for five miles, the time being 5 minutes, 28 seconds.

Yours, respectfully, HENRY FORD.

BROKE THE RECORD.

A Winton Touring Car, on October 15th, ran the 250-mile course between Boston and New York in the remarkable record time of less than twelve hours. The car won a perfect score and had the advantage of complete check by the control officials of the Automobile Club of America's New York-Boston-New York Reliability Run.

The Performance Clipped Six Hours from the Previous Best Record.

This car, owned by Mr. H. Corey, the well known Boston banker, had just been released from customs after completing a several thousand miles successful tour upon the European continent. It was a 15 H. P. car with standard 1902 equipment throughout.

White Steam Carriages

HAVE BEEN AWARDED

FOUR GOLD MEDALS

FOR THEIR MAGNIFICIENT PERFORMANCE IN THE

A. C. A. RELIABILITY RUN.

Throughout the 500 mile Reliability Run from New York to Boston and return the **WHITE STEAM formed a procession which moved with absolute steadiness** —making every control on schedule time, and coming through without mishap of any kind. Out of 75 entries, 17 made perfect scores, and **of this number 4 were Whites.**

The three White Steam Stanhopes each received the highest possible award, while of the two White Delivery Wagons, (the only automobiles of this type ever completing an endurance contest) one received a Gold Medal for perfect performance while the other had only one stop—due to its handling.

Write for full particulars, including Prof. Thurston's report on our Steam Generator, and Official Reports of Important Endurance Contests.

"THE BEST THING ON WHEELS."

The OLDSMOBILE

This pioneer Automobile is recognized as the standard Runabout of the world.

Its simplicity of construction and its known reliability appeal to the purchaser who wants a machine that is built to run and does it.

The OLDSMOBILE is the easiest machine to sell because its real worth is best known.

Its speed and reliability are proven by the highest awards in Race, Endurance and Reliability Contests.

NO NOISE——NO ODOR——NO VIBRATION.

PRICE, $650.00 AT FACTORY.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.

Volume V. New York, U. S. A., Thursday, November 13, 1902. No. 7

BATTERING THE MILE

Fournier Lowers the Record Only to be Outdone by an Anonymous "Paris Merchant."

After being held by W. K. Vanderbilt, jr., for just one day over three months the world's record for one mile passed into the possession of Henry Fournier on Thursday last.

At Dourdan, about thirty-five miles from Paris, the former holder of the record regained possession of it by covering a measured mile in 47 2-5 seconds. The previous best time, Vanderbilt's, made on August 5, also outside of Paris, was 48 2-5 seconds. Both Fournier and Vanderbilt used Mors racing cars.

After succeeding with the one mile record an assault was made on that for one kilometre. The best that could be done, however, was to administer a slight beating to the French record, Fournier's time being 29 1-5 seconds as against Vanderbilt's 29 2-5 seconds. The kilometre time was given out as a world's record, but the latter stands to the credit of Charles Jarrot, who covered the distance in 28 1-5 seconds on August 22 at Welbeck, England. It is true that the latter is not generally recognized, it being claimed that it is rendered invalid by reason of the course being slightly downhill.

Although sixty kilometres from Paris, no better spot could have been selected by the Automobile Club de France for record breaking, as there is a straight run of four kilometres on a level road, with an open space for turning at each end, and, as it is right up in a forest, the sandy road is only used from time to time by woodcutters' carts, automobilists, cyclists and those on pleasure bent.

Fournier's mile in 47 2-5 seconds was not a week old when "M. Angieres" gave it a sound drubbing, covering the distance in 46 seconds flat. This feat was performed on Tuesday, on the same road, near Dourdan, that was the scene of Fournier's ride. A Mors racing car was the vehicle used.

The new record holder is said to be a wealthy Parisian merchant, who conceals his identity under the pseudonym of "M. Augieres."

Detroit Fixes its Dates.

Formal announcement is made that the second annual show of the Tri-State Automobile and Sporting Goods Association will be held at the Light Guard Armory, Detroit, Mich., February 9 to 14, inclusive. In view of the undoubted success of the show held last February, it was a foregone conclusion that it would be repeated. It is promised that the show will excel last year's, both in size and attractiveness. A majority of the exhibitors have already signified their intention of again taking space. S. G. Lewis, Box 5, Detroit, is the secretary of the association, and all correspondence should be addressed to him.

W. E. Morrison Dies After Operation.

Walter E. Morrison, president of the Dow Portable Electric Co., died rather suddenly in the Polyclinic Hospital, this city, on Tuesday night last. His headquarters were in Boston, and he was here on one of his periodical business visits when his malady, cancer of the stomach, took a serious turn. He was removed from the Herald Square Hotel on Sunday, and the next day underwent the operation, from which he failed to recover. Mr. Morrison was but 37 years of age. He was a particularly energetic and likable man, whose efforts had contributed very materially to the success of his company.

Gash Becomes General Manager.

W. D. Gash has been elected general manager of the Fournier-Searchmont Automobile Co., Philadelphia, succeeding E. B. Gallaher, who recently joined the Mobile Co. of America. Gash was formerly sales manager of the company, and his promotion seems natural, and is the best tribute to his ability, and indication of the appreciation in which he is held by the directors.

The Three A's Annual Meeting.

The annual meeting of the American Automobile Association will be held on November 17, at the rooms of the Automobile Club of America, this city.

Field is Out Again.

C. J. Field, formerly with the De Dion-Bouton and other companies, has relinquished his connection with the trade.

THE FROSTS ARE OUT

Welles and Keck Buy Their Interest and Badger Factory Will now Make Lamps Only.

Owing to the growth of the business in each of the two departments of the Badger Brass Mfg. Co., it has been deemed wise to separate the plumbers' supplies from the cycle and motor lamp business, and to that end C. N. Frost and W. J. Frost have retired and formed the Frost Mfg. Co., for the manufacture of plumbers' supplies.

Their interest has been purchased by Mr. L. J. Keck, who has represented Solar lamps on the road for the past six years, and will continue to do so, and by Mr. R. H. Welles, present treasurer and general manager. With this exception the company will continue as before, except with better facilities for the handling of the rapidly increasing demand for Solar motor lamps, the 1903 models of gas and oil side lamps and headlights, which have met with such favor.

The main offices and factory will be as heretofore, in Kenosha, Wis., but after January 15th the company will open a New York branch, where a complete line of stock and parts will be carried for the better handling of the Eastern trade.

Detroit's Newest Company.

It is the intention of the Imperial Automobile Co., just organized at Detroit, Mich., to manufacture light electric vehicles, such as runabouts, stanhopes, surreys and delivery wagons, using Imperial motors. Orders have already been received for a large amount of work, and several sites for the factory are under consideration, it is said.

Washington Show Set for April.

The Washington (D. C.) Automobile Dealers' Association has decided to hold their annual show—their third—during April next; the exact dates have not been set, but the plans in view contemplate a two-days' race meet on the Bennings track, to occur during the dates of the show.

RACING REFORMS

Several Movements of the Sort Inaugurated Abroad—French Resent English Interference.

French Bureau Motor World,
2 Rue d'Abbeville.

Paris, October 31, 1902.—Some important changes seem on the point of being carried out in the method of organizing automobile races which have up till now been carried out in a manner that is little calculated to advance the interests of the sport.

Except for one big event, the promoters of all the races and tests has been left in the hands of the automobile papers, which have devoted their energies chiefly to blackguarding each other, and however enterprising they may be they can scarcely be expected to advance the interests of automobolism so much as could be desired when they merely aim at advertising themselves and makers instead of providing useful data for buyers. In view of the rivalry between the papers they cannot, of course, run the risk of courting a failure, and the races and tests they organize are therefore not always of a disinterested character. In hope of attracting the greatest possible number of entries the races are split up into all sorts of categories and classes until there are almost as many awards as there are vehicles competing, and a car must be utterly hopeless if it is unable to get a prize of some sort, which will allow of the maker puffing it up as something of a phenomenon. This is all very well in its way, and there would be no cause for complaint if it were plainly understood that many of these tests are simply carried out for the purpose of advertisement. The public may then draw their own conclusions and not be surprised if they find that a car they purchased does not show up so well as one of an alleged similar type, which has probably been specially prepared for a test or race.

This rivalry between competing journals has also had the effect of creating friction between the authorities who have to sanction the meetings, and this culminated in the recent hill climbing tests when the second Gaillon meeting had to be postponed. As the result of these incidents it is understood that the Automobile Club has decided upon taking all the sporting events out of the hands of the newspapers, and placing them under the management of the sporting commission, which is really the only properly qualified body for organising races or speed tests of any kind. If this is to be done it is to be hoped that the commission will adopt an entirely new series of racing regulations, which will enable the public to judge of the merits of the standard types of cars and not be led into believing that they are the same as the more or less extraordinary vehicles which, however fast they may prove in skilled hands, are utterly unsuitable for the average automobilist. In the case of racing pure and simple, there is, of course, no reason why makers should not be allowed full liberty in the designing of special machines. The public are perfectly aware that the monsters prepared for big long distance races do not represent the types of vehicles they are offered to buy, and it is by allowing manufacturers to experiment in this way that so much has been done for the development of the automobile. They try new devices which, if successful, are adapted to the new vehicles, and there has in fact scarcely been a single race which has not revealed the efficiency of some new mechanism which has done a great deal for the advancement of the industry.

Where a reform is particularly needed is in the method of arranging tests on gradients or over kilometre courses, which are intended to show the capabilities of standard types of vehicles. It is safe to say that there are few makers who send their ordinary cars to compete in these events, and by stripping them of every ounce of weight, and fitting motors of higher powers, they get results that would not be possible with the standard cars, and buyers have no fair data to go upon in estimating the capabilities of the respective vehicles. The misleading character of these performances was revealed at a hill climbing test in Switzerland last month, when points were given according to the co-efficients of weight, power, speed and load, and on that occasion all the light racing vehicles were beaten by the touring cars. A few more tests like these ought to prove very interesting and instructive.

This question of reform in racing is not only beginning to occupy some attention in this country, but it has also been raised by the Automobile Club of Great Britaan and Ireland. It perhaps savors of unwarranted interference for the British club to pose as a mentor of racing, when there are not more than a couple of foreign-built vehicles which take part in international races, and so long as the sport is confined to the French cars it might have been supposed that the A. C. F. could be left as the supreme arbiter of racing until such time as the development of the industry abroad placed foreigners on the same footing as the French. But while this interference may be a little premature, there is no doubt that it was certain to come in the more or less distant future, simply because the English and French look upon sport from an entirely different standpoint, and its management would have to be reformed to meet their respective views as soon as the two were on something like an equality in the number of vehicles competing in international events.

The British Club has sent out a circular to all the Continental clubs, with the exception of the A. C. F., to sound them upon the advisability of bringing about a change in the present regulations. What the English object to is that the sport should be entirely under the control of manufacturers for whose benefit the different events are organized, and they think that the sport should be raised above any question of commercial interest, and placed entirely beyond suspicion. They therefore propose that the international committees should be composed exclusively of members of clubs and owners of vehicles who are not interested in the industry, either as directors, paid officials, makers or agents. The method of timing the cars at controls is also to be changed by having two cards for each competitor, one for the driver and the other for the officials, and upon these cards are to be inscribed the times of stopping and starting at each control, so that there can be no possibility of mistakes such as have proved so troublesome in the past. There are several other points submitted to the clubs, such as the absolute prohibition of a competitor being assisted on the road in any way, and if the different clubs return favorable replies to this circular there is no doubt that the proposed reforms will be brought to the notice of the A. C. F.

Judging from the feelings of makers on the termination of the Paris-Vienna race, it seemed as if the death knell had been sounded for these big international events, and many a manufacturer declared that he would not again allow himself to be put to such worry and vexation in racing over roads he knew nothing about and through a country where the inhabitants and the authorities seemed to have very hazy ideas of the true character and object of an automobile race. As soon as these unpleasant incidents were forgotten, however, the question of organizing a race from Paris to St. Petersburg was again revived and once more postponed until such time as the Russian roads will permit of automobiles travelling at racing speed. In default of the Russian capital the A. C. F. now proposes to organize a race next year from Paris to Madrid. There are very strong reasons for carrying out this event, one of them being political, while it appears that the suggestion has come from a very high Spanish quarter where it is hoped to awaken an interest in the automobile in the Peninsula, and also assist in the creation of a club in Madrid.

At present Spain is the only country in Western Europe which has proved refractory to the motor vehicle. The principal cause of this is the state of the roads, which are not suitable for anything giddier than mules. The Spanish authorities have offered to do all they can to put the roads in good order for the race, but after the experience of the Arlberg last June, where "repairs" were also carried out, the A. C. F. would be very unwise to rely upon these promises. The club has decided to send a delegate to Spain to examine the three routes that may be taken, and if it be found that high speeds are impossible the race will probably be transformed into a reliability test, when each maker will enter half a dozen cars, and points will be awarded for their aggregate performances. It is probable, however, that the course from Paris to Bordeaux will be covered at racing speed.

NILES ON KELLOGGISM

The Counseller Throws Light on Clouded Points and Hints of Grave Breach by Kellogg.

It would appear that the Automobile Club of America and the American Automobile Association are not to remain entirely quiescent in the case of Judge W. C. Kellogg, the "Man of Yonkers," whose territory automobilists must approach in fear of jail. Counsellor W. W. Niles, of New York, who represents both the Club and the Association, is inquiring deeply into the recent cases that have come before the Yonkers Dogberry who believes in stripes and bars for those who handle a steering lever on an automobile.

With so thorough a lawyer interested in the proceedings of the Yonkers court there is every reason to hope for some reactive results that will be gratifying to the automobile public at large. Naturally, Mr. Niles is conservative in his expression of opinion. When a representative of the Motor World called on him to inquire about the legal aspect of the "justice" being dispensed by Mr. Kellogg, he did not say whether or not any line of action had been decided upon

The Motor World man asked him whether in his opinion it was legal for Judge Kellogg to sentence Paul Richards to ten days in jail because he was exceding the speed limit. Mr. Niles replied:

"But, you see, that is where Judge Kellogg has the better of it. He does not try the man under the Cocks law. There is no charge of excessive speeding against him, but a charge made under the common law and the Yonkers charter of endangering life and limb or something of that sort. The common law is the thing which we stand for, and we maintain that it is a mistake to have a speed limit of any sort. That it is wrong in fact, because it permits of a certain rate of speed when the local conditions may not warrant it. The law that prohibits reckless driving and the endangering of life or limb is sufficient."

"Mr. Niles, if a man is running an automobile at a very high rate of speed, well beyond the limit of the speed law, on a road that is all clear ahead of him, on which there is no vehicle or person in sight, could he be convicted for endangering life or limb on the theory that someone might get in front of him and that he was going too fast to stop in time to avoid disaster?"

"That is where the weakness of the common law comes in. As you put it, I should say no, but a judge might decide otherwise."

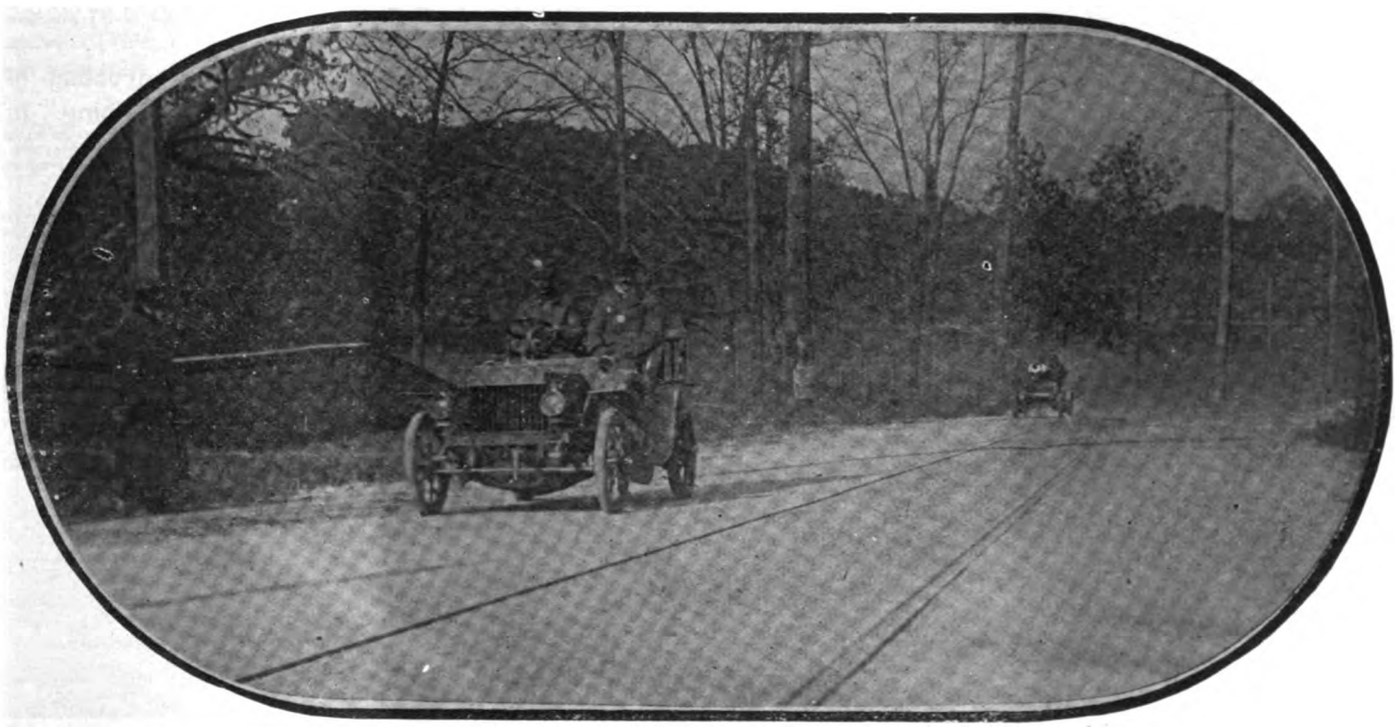
"Concerning the ordinance proposed to license automobiles, Mr. Niles, you have noticed probably that Mr. Thompson says that the city charter granting power to the municipality to regulate and license traffic supersedes the State statute commonly known as the Doughty law, which prohibits cities from passing such ordinances. In a case of conflict such as this, does not the State statute have precedence over the city charter?"

"That is a matter for the court to determine. The Doughty bill was passed a few days after the New York city charter. Personally, I hold a different opinion from Mr. Thompson, but nothing absolute can be said in a case of conflicting law until a decision of the intent of the statute has been delivered by the court."

"In such cases is it not generally true that precedence is given to the later enactment?"

"As a general principle of law, yes. In common practice the supersdence would be given to the statute passed after the charter."

"Now, if that is true in the case of the charter of Greater New York, Mr. Niles, why does it not hold good with regard to the charter of Yonkers under which Raymond was sentenced and now Richards? Why should not the Yonkers court be bound by the State law?"



"I am still investigating these cases. I believe that it was not under the charter or under the Cocks law that Richards was sentenced, but under the common law."

"Mr. Niles, in the case of a magistrate who has openly expressed prejudice against a certain class and a resolve to punish severely all of that class brought before him, what would be the legal procedure to remove such a man from the bench?"

Mr. Niles spent some time looking through his statute books. He said that there was a provision for the removal of a city judge by the Governor when corruption, negligence or incompetency was proven, but as for charges of malfeasance or persecution, he preferred to say nothing until after he had looked up the law.

"If a magistrate, speaking from the bench, from his seat of office, gave utterance to sentiments of bias and plainly showed that he was determined to prejudge a case, regardless of legal evidence, would that not be grounds sufficient for impeachment?"

Kellogg to take a counter charge, in the Kellog to take a counter charge, in the Raymond case, is, if true, a very serious matter."

NEW YORK, NOVEMBER 13, 1902.

Purchasers and Their Whims.

In these times when, generally speaking, the demand exceeds the supply, the unbending policy adhered to by not a few manufacturers may work no immediate injury to their interests, but when a normal condition of trade is reached there may be another story to tell.

We refer to the stubborn refusal of some makers to indulge the slight whim of the purchaser paying $1,000 and often as much more for a car. Of course, we appreciate that so far as they relate to the mechanism of the vehicle, refusals to cater to the whims of the sort are justifiable and proper. But so far as concerns the finish and equipment it seems to us a little latitude would go far toward earning the good will and friendships that bear on the future.

An instance of the sort involving manufacturers of no mean reputation, recently came to our notice.

"They are the most disobliging people I have met in some time," said the party in interest—a man in no wise connected with the trade. "I had already bought one of their cars, and in placing an order for another, I asked only that the body and the upholstery be finished in a color different from the standard, and offered to pay $200 extra for the service. My request was met by a curt and point blank refusal. If I had not offered to pay for it, I could understand the manufacturers' attitude. As it is, it has left a bad taste in my mouth, and if ever I make another purchase it probably will be from another manufacturer."

They say it is the "little things" that count, and to our way of thinking, whims such as this are included in the category. Catering to them when it entails no loss would seem to come under the head of "good business," and makes for satisfied customers.

No Cause for Apprehension.

Fears are entertained in some quarters that sales of second-hand cars will result in harm to the dealings in new ones.

Especially keen is this apprehension where the runabouts and similar light and cheap vehicles are concerned. Every year their number increases, and if buyers continue to snap them up with avidity it is asked where customers for all the new cars will be found.

Those who entertain these fears overlook one very important fact, to wit: that it is price that attracts these buyers, and that the only thing that to-day stands between a majority of the people of the country and automobiles is the matter of price. Were they procurable at nominal figures, were their purchase a mere bagatelle, ten times the present factory output would be insufficient to meet the demand for them, and the roads would swarm with automobiles as they once swarmed with bicycles.

The sale of an automobile is to be likened to tossing a pebble into a placid pool; the ripples caused by the one act spread in ever widening circles, while the influence of the other is exerted in every direction, each person with whom the buyer comes in contact being made aware of his action.

The trade in this country has reached a stage where even its second-hand vehicles have a real value.

There are no longer any thoroughly bad automobiles—or at least, very few. The vast majority of them show a wide variance in the matter of excellence, but there is some good in all of them, and of this good the user will taste and have his appetite whetted for something better.

It matters little whether he belongs to the class of men that can or cannot afford to pay more than a second-hand vehicle costs. In the former case he will unloose his purse strings as soon as he becomes convinced that it is good policy to do so, and that by paying more he can obtain greater value for more money. In the latter case the possession of a cheap vehicle will inevitably breed a desire for something better, and once that desire is born, ways and means to gratify it will be found.

In some industries it is the practice to break up goods that have become second-hand, or to use other means to check their sale.

In the automobile business just the reverse policy should be, as it is, followed. Every effort should be made to disseminate the knowledge that there are second-hand automobiles to be had, and that they are good value for the money. No fear that the sale of such cars will interfere with that of new goods need be entertained. In a few cases, perhaps, this fear may be well founded. But the number is so small and the beneficial effect of such sales on the trade in general is so great that the balance will be enormously on the latter side.

Woodbury and His Squee-gee.

Mr. Woodbury, New York's Street Cleaning Commissioner, and his squee-gee are good things, and it is to be hoped that they both will remain in office and in perfect working order for some time to some. There is no doubt about the earnestness of the Commissioner to give the city clean streets and deal with the asphalt so that it shall not be slippery to the tire of the automobile. Also there is little doubt but what the squee-gee can be modified so as to fit the crime of the asphalt in being so irregular, and when this is done the asphalted avenues can be washed and dried like a school boy's face and left with a surface affording a good tire-hold for vehicles and a good foothold for horses.

In connection with the squee-gees that would not work, because they were hastily constructed and did not meet the requirements of the undulating pave, it is ventured here to make a suggestion to the Commissioner. Let the squee-gee instead of being in one piece, ten or twelve feet long, be divided into several pieces like teeth, but with no space between. Then above each

Digitized by Google

tooth have a spiral compression spring, so set that on the level surface it will be partially compressed and will give pressure to the blade and when a depression in the surface is encountered it will force the tooth into it. It would, of course, be necessary to have a pair of such squee-gees on a machine, in order that the rear one might swab the places left untouched because of the division into teeth. This suggestion is, however, a digression.

After Fifth avenue has been properly equipped with made-to-fit squee-gees, what is to be done with the other asphalted avenues running north and south, every one of which has a railroad slot along it? The Commissioner frankly admitted before the aldermanic committee that these slotted streets cannot be flushed and squee-geed like Fifth avenue, because the water running into the conduit would cause short circuiting. After all it seems that for some things even in these mechanical days we must fall back on the good, old fashioned and reliable hand-power. When this was put to Commissioner Woodbury and the question asked why it would not be best to have the squee-geeing done manually, as it is in London and Paris, the Commissioner exclaimed: "But think of the tremendous cost of that!"

Tremendous cost? Well, they do not think so in London and Paris. New York in proportion to population can better afford the expense. Why should we not have clean, safe streets no matter what the cost? The health and comfort of the whole population, the utility and safety of all the city's traffic hangs in the balance of clean streets and asphalt that is not treacherous.

Commissioner Woodbury has made up an estimate of $161,830 as the cost of establishing a plant and putting this work wholly in charge of his department. He estimates an additional cost of $197,480 a year to run it. It may seem like a lot of money, but it is a trifle in a city like New York when so much is at stake. When the city budget for next year is made out the Department of Street Cleaning should have this matter in hand with the necessary funds. It should have more money, too; enough more to enable the department to properly scrub by hand during the night every foot of asphalt in the city, so as to render it safe for the traffic of the day.

It is the proper province of the automobile trade in New York and in every city to bring its influence to bear in such matters. The manufacturers and agents are overmuch given to leaving agitations of this kind to the clubs and other societies. Whatever makes for good roads, for better streets, for better and safer automobiling rebounds directly to the advantage of the maker and dealer. When certain things are needed the pressure should be put on to obtain them. Whoever has influence should make it felt, and every one has influence. It is not enough to have a manufacturer's association represented by its counsel at a public hearing. It is the earnest voice of the individual who is interested that counts. Let the automobile trade, that represents so much capital locked up in this new and important industry, rally to the support of the Automobile Club, the horsemen and the cyclists in all such efforts.

Good Out of Bad.

The enormous popularity of the motor vehicle is to be accounted for in a number of ways.

Its intrinsic merits, manifest destiny and the like may well be put forth as reasons for it. What must be will be, and the inexorable law that demands the gradual retirement of the horse from city streets and, as a draft animal, from country roads, can neither be gainsaid nor its workings impeded or interfered with.

But another theory—fantastic and even grotesque—can be advanced to enlighten a waiting world on this matter of the general favor of the motor vehicle.

It is that advertising, and, speaking more pointedly, the advertising of its enemies, has had much to do with it. We may not go so far as to say, as was said of a distinguished statesman, that "we love it for the enemies it has made," but we are quite within bounds when we declare that nothing can be kept constantly in the public eye, abused in season and out, maligned, painted a very monster, without some of the torrent of vituperation recoiling on its authors.

No one can question the value of advertising. And if the advertising be of the dubious kind that so many of our friends have seen fit to favor us with of late, it differs only in degree from the more desirable sort that is usually bought and paid for.

For months the automobile has been on every tongue, on well nigh every page, frequently in a dozen different articles, of the average newspaper.

People who, in the ordinary course of events, would either not have heard of it, or would have paid no attention to it, have had it forced upon them that the motor vehicle was one of the most active and positive forces of the day. Its very ubiquity would tend to do this. Whether it was loved or hated made no difference. There it was, and it could not be got away from.

It is beyond question that if automobilists had had the doing of it the motor vehicle would have come in for a much smaller degree of attention.

But more powerful influences intervened, and the result has been what we see. We may squirm a little, and wish for a little less publicity, but we certainly are getting all the advertising we could possibly desire.

Kelloggism Rampant.

Again the fine judicial temper of the Kellogg sword of justice has been demonstrated. This time it was a chauffeur of New York City, Paul Richards by name, who was the victim. There seems to be no doubt but what Richards was guilty of excessive speeding in the town of Yonkers, and should be punished. There is a State law that provides for a fine of $50 in such cases.

The State statutes are not good enough, however, for the Solon of Kelloggtown. He must needs rake up some law under which the man who runs counter to his prejudices can be put behind the bars. Richards got ten days. It seems a pity that Kellogg cannot find a law permitting him to hang reckless chauffeurs in the public square. It must make him sad to think of the fun he is missing.

How long is Yonkers and New York going to stand this sort of thing? Until Kellogg violates every principle in the Constitution of the United States? Well, as Abraham Lincoln said: "For people who like that sort of thing, it is probably just the thing that such people would like."

An old saying runs to the effect that if you want to learn about anything of which you are ignorant you should write an essay or lecture on it. Apparently this is the motto responsible for many of the newspaper "specials" designed to instruct a benighted public on automobile subjects. Even the New York luminary that boasts of everything in it being "so" has fallen prey to an expert who solemnly tells of what is coming to pass and prints a picture of a big gasolene car as a type that is disappearing, and another picture of a little steam runabout as that of a type which is becoming popular.

SRRINKLING AND SPEED

Laws Affecting Both up For Hearing and Provoked Interesting Debate.

The great growth of interest in street and road matters and traffic regulation was well exemplified last Friday by a lively and important session that was held before the Law Committee of the New York Board of Aldermen. The meeting was called in order to afford a public hearing on three ordinances now before the City Fathers. One is a bill requiring that the ten year contract of the Street Sprinkling Association with the city, which expires next March, shall not be renewed, but that the sprinkling of the streets shall be placed in charge of the Department of Street Cleaning. The second ordinance up for a hearing was that regulating traffic on the streets, commonly referred to as "rules of the road." Both of these were introduced by Alderman Joseph Oatman, president of the Associated Cycling Clubs of New York. The third ordinance was one introduced by a certain Thompson, of New York, proposing to license and tag automobiles, in spite of a State statute prohibiting any municipality from so doing.

These subjects brought out a distinguished company. Among those who participated in the discussion were the president of the Society for the Prevention of Cruelty to Animals, John P. Haines; the president of the Automobile Club of America, Albert R. Shattuck; Commissioner of the Department of Street Cleaning, John McGaw Woodbury; the president of the Associated Cycling Clubs of New York, Alderman Joseph Oatman; the counsellor for the Brooklyn Rapid Transit, Thomas L. Hughes; the secretary of the Hackmen's Protective League, Robert Winston; the chairman of the Committee of Fifty, J. Bayard Backus; the secretary of the Road Drivers' Association, Alfred Reeves; the president of the West End Association, J. L. Brower; the counsel for the National Association of Automobile Manufacturers, W. W. Niles; the president of the Road Users Association, Jefferson Seligman, and R. G. Betts, of the New York Motor Cycle Club.

Thompson, who has been pushing himself well to the front in this matter, lost no time in taking the centre of the stage and getting into the lime-light. He called attention to the fact that he had drafted the sprinkling ordinance. The history of the bill is that it was first proposed before the Associated Cycling Clubs by Alderman Oatman that such a bill be drawn. It was then carried to th meeting of the Associated Road Users, and the co-operation of the automobilists and road drivers and cabmen obtained. Thompson, who was for that meeting representing the State Division of the L. A. W., volunteered to draw the ordinance, and did so. After it was read and revised by the Road Users it was formally introduced.

Thompson recited at length the grievances of sloppy and slippery asphalt, the danger of it to horses, vehicles and persons, and the fruitlessness of the many attempts to have the Street Sprinkling Association abate the nuisance. He explained that the Sprinkling Association was a West Virginia corporation, incorporated with a capital of $700, and that it paid the city a lump sum every year for whatever water it used, and watered streets wherever it could get the residents along them to pay a weekly toll, and did not water others.

When he had finished, Thompson, with an authoritative and condescending air that made Alderman J. C. Meyers, who was then presiding and others, smile, waved his hand toward Commissioner Woodbury, and said: "We will be glad to listen to you now."

It was evident from the outset that Commissioner Woodbury was "loaded for bear." He had his hands full of papers that proved to be estimates of cost, and charts showing how the street cleaning work of the city is done. The Commissioner launched his theme by explaining the peculiar nature of asphalt,

THE FAMILIAR QUESTION: "WHICH WAY?"

which caused a film of gummy substance to form on its surface from the crushed refuse of the street. This gum, when simply wetted, is loosened, and with the water forms a slime that is very slippery. When, however, the surface of the asphalt is flooded and then gone over with squee-gees, as is done in London, the gum is scraped off and the clean asphalt offers a splendid surface for the foothold of horses and an excellent traction for all sorts of vehicles. He went on to say that it is possible to handle the matter of street sprinkling in two ways, one by letting the work out at contract, under which method it would be very difficult to get satisfactory service, and the other by placing the whole thing in the charge of the Department of Street Cleaning and having the city do the work itself. He favored the latter way, and at the request of the Law Committee had prepared an estimate of what it would cost to establish a plant and the annual expense of running it. The estimate was for sprinkling not a part of the streets, but all of them in Manhattan and the Bronx. To sprinkle Brooklyn he estimated would cost 60 per cent. more. Richmond and Queens, under the new charter, are not in the jurisdiction of the department. This is a summary of his estimate:

Two hundred sprinkling trucks at $250 each, $5,000; four hundred and forty horses at $247 apiece, $108,680; seventy sets of harness at $45 a set, $3,150. Total cost for establishing a plant to be met by bond issue, $161,830. The running expenses he figured thus:

Two hundred drivers for eight months at the rate of $720 per year each, $96,000; forty hostlers for eight months at the rate of $840 per annum each, $22,440; feed for 440 horses for a year, $55,000; shoeing, $14,080; stable rent, $10,000. Total yearly cost to be met by appropriation, $197,480. Grand total for first year, $359,310.

Alderman Isaac Marks took an active part in the proceedings up to a certain point. He cross-examined the Commissioner, asking many pointed questions about matters of expense and the effect upon the water pressure of the use of the city water for sprinkling. The Commissioner was quick, lucid and incisive throughout. Alderman Oatman brought out the fact by a question that salt water would be better than Croton water for washing purposes. Alderman Marks asked the Commissioner why the substitute ordinance which he, Marks, had prepared, was not better than the one under discussion. The Marks ordinance calls for the letting of contracts for the sprinkling of each borough by the borough president, after bids have been submitted by persons who had experience in street sprinkling. The Commissioner thought it would be unwise to divide the work and the responsibility for street conditions between the Department of Street Cleaning and the Borough President.

Mr. Thompson called attention to the fact that, as it is drawn, the ordinance proposed by Alderman Marks, which requires that only those with experience could bid for sprinkling contracts, would permit only the Street Sprinkling Association, which is now being inveighed against, to bid. Furthermore, he expressed his opinion that Section 471 of the charter prohibits the award of any contract to use the city's water to any private firm or corporation. After this Alderman Marks did not speak again.

Robert Winston, of the Hackmen's League, was a character. In a rich voice, that had just a touch of the Coster in it, he said that he had driven a cab in London, Paris, Berlin, Melbourne and New-York, and thought he knew something about street sprinkling. He was pithy and pointed. He told of the difficulties of the cabmen with horses that fall on slippery asphalt, and told how they do it in London. There they wash the streets and squee-gee them between midnight and 4 o'clock in the morning, and after that they are sanded. He frankly advised the Commissioner to adopt this method, saying that the cabmen were in favor of the ordinance and would do all they could to help the department. If sand boxes were placed at different points about the city, the cabmen, he said, would be only too glad to help themselves and sprinkle it for their horses. Many

Digitized by Google

a winter night, he said, the cabmen went hunting desperately for ashes when the paving was so slippery that a horse would fall six or seven times to the block.

President Haines of the S. P. C. A. said that every year his agents had to kill many animals that had been hurt by falling on slippery asphalt. He favored the ordinance. President Shattuck and W. W. Niles also spoke in favor of the measure.

When the rules of the road were taken up, Mr. Backus, of the Committee of Fifty, was promptly on his feet to oppose the increase in speed for automobiles from eight miles an hour to ten miles. President Shattuck explained how ridiculously slow eight miles an hour is, saying that at that rate it would take five hours to go from one end of New York to the other. He said that the automobile was safer than a horse, and read from The Motor World of October 30 the statistics showing the number killed and injured by different vehicles of transportation.

Mr. Brower, of the West End Association, was on hand, as usual, to repeat all of his usual arraignment of the automobile, that threatens the lives of old women and children. He said it was the exception to see an automobile moving at the legal rate of speed. Alderman Armitage Matthews, who had come in late and taken the chair, suggested that the same was true with regard to victorias on Riverside Drive.

Horace Parker, of the Committee of Fifty, recited a lot of figures concerning the number of automobiles and horse drawn vehicles passing a certain place, and the speed of them. Of fourteen motor vehicles timed, he found not one that was within the speed limit, and one was going faster than twenty-five miles an hour. He objected to permitting motor vehicles to go faster than horse drawn carriages. Mr. Shattuck said that the figures were unreliable, and about proved it.

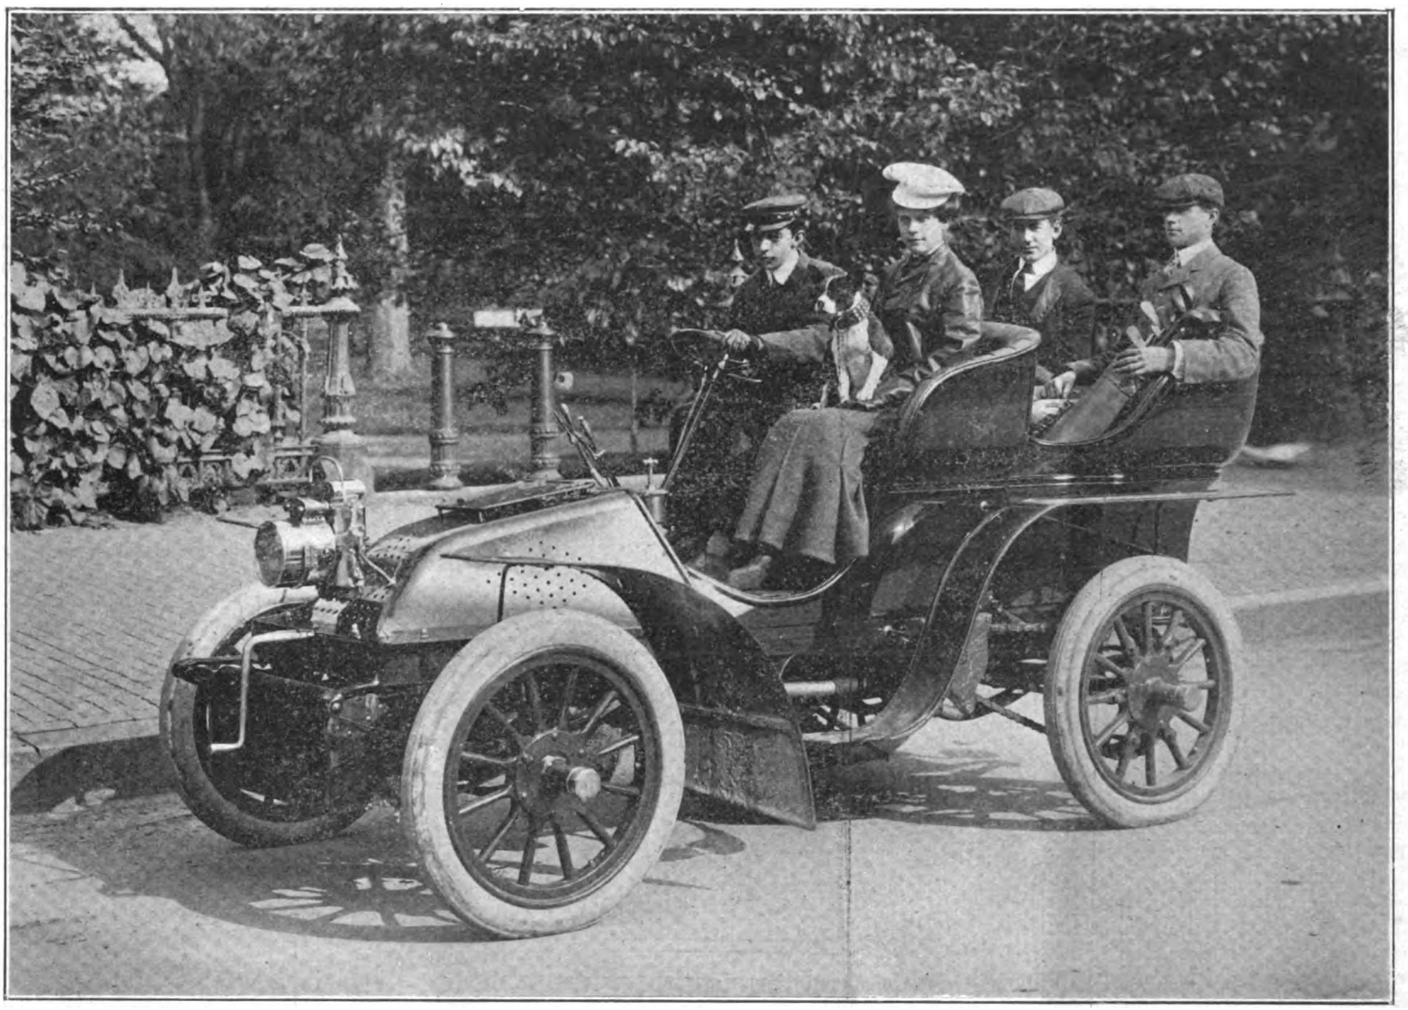
R. G. Betts suggested as a solution of the difficulty that no discrimination in favor of the automobile be made, and the horse drawn vehicles also be allowed to go ten miles an hour, which is very slow. This immediately brought to his feet James Brown, of the Hackmen's League. With an accent that faintly suggested Bow Bells he said:

"That's it! Pass the ordinance, and let the cabs go ten miles an hour, too. Bless my heart! Ten miles an hour ain't nothing, and eight miles is awful slow. Why, I drive fifteen miles an hour every night, and sometimes twenty miles an hour."

"I'd like to hire your cab sometime," interjected Mr. Shattuck.

"Well, I've the best cab in town, and $100 to say that I can beat any blooming automobile with it. I've gone from Twenty-sixth street to One-hundred-and-twenty-fifth street and back in forty minutes more than once—there and back, mind you!"

"How long does it take you to drive around the park?" asked Alderman Matthews.



"That depends entirely upon the fare, you know."

"Well, I mean doing it leisurely and not driving hard."

"Taking it real nice and easy, I can go around in forty minutes. I could do it in twenty-five minutes."

Counsellor Hughes, of the Brooklyn Rapid Transit, wanted the ordinance to provide for the carrying of rear lights at night by farmers' wagons. He also suggested that horse drawn carriages should be made to slow up before crossing streets, the same as trolley cars are required to do.

The license ordinance was not reached, and after a three-hour session the hearing was adjourned without date.

MR. AND MRS. BYRON CHANDLER, OF NASHUA, N. H., IN THEIR TOLEDO GASOLENE TOURING CAR.

Commentary

I'm a little late I know, but I want to shy my little half of a brick at that learned luminary of the law who is content to hide his greatness in the vast city of Yonkers—his honor Judge Kellogg, no less. Of the justice of railroading a man to prison for the awful crime of being run in to from behind I will say nothing, though use of the word "railroading" makes me think how queer it would seem to have the engineer of the leading train arrested and sent to prison should, on a perfectly clear track and in broad daylight, another train overtake his, run into it and injure a lot of passengers in the overtaker's train. Of course, substituting a trolley car for the overtaking train and an automobile for the leading one this is just exactly what happened at Yonkers, but little things like reason or common sense have no weight with a modest, austere, upright man like Judge W. C. Kellogg. I always admired this gentleman ever since I saw his picture in a yellow journal along in last May. Accompanying the picture was an alleged interview, in the course of which this learned lawgiver sapiently remarked:

"Apparently the rich do not care what happens to those who get in their way. A little boy, a girl, an old man or an aged and bent woman would meet a like fate beneath the wheels of an automobile. The fact that the drivers of these automobiles are rich and of social prominence has no weight with me. I would fine Vanderbilt or any other rich man as soon as I would a poor man. I can foresee a great social revolution unless there be a change in the attitude of the rich toward the poor."

Imagine a judge who would so far forget the dignity of his position as to preach such rot and encouragement of anarchy as the foregoing, to still have the audacity in sentencing a man to prison for the heinous offence of having been run into by a trolley car which overtook him, to say, as Judge Kellogg did when he sent Raymond to prison:

"The conduct of this defendant was reprehensible in the extreme. I have no prejudice against automobilists and bicyclists in general, but they must be made to understand that the general public has rights on the highway which they must respect."

Were the Pharisee of old to return to this life he would find that he had much indeed to learn from his successor and superior, Judge W. C. Kellogg, of Yonkers, N. Y.

* * *

As many who have tried to travel the road in an automobile have learned to their sorrow, invention is generally a mighty rough route to Easy street.

* * *

Mulai-Abd-el-Aziz, who it will be remembered on the occasion of President Roosevelt's escape from exactly the same kind of an accident which Judge Kellogg has sentenced Mr. Raymond for, took occasion to send a cablegram congratulating the President on his escape from an automobile, is in a fair way to ask for a return message from the President. While, of course, there was no automobile in any way connected with the President's accident, still Mr. Aziz had probably seen a copy of some yellow journal, and from it quite naturally concluded that there were no accidents of any kind in America for which the automobile was not to blame, hence his cablegram to the President. Now comes the news, also by cable, that the subjects of the Sultan have threatened to break out in rebellion. They stood for Aziz when he got a telephone, they took their medicine when he built a narrow gauged railroad, but every blessed donkey boy, camel clubber and horse thief in Morocco drew the line when the progressive Aziz showed up with an automobile. What the result will be depends upon whether the purveyors of news and law in the Sultan's domains are of the saffronic and Kelloggian stripe. If they are, then Allah will have his hands full saving Mulai-Abd-el-Aziz, sure as shooting!

* * *

Automobiling has its share of Smart Alecks, but even in it no one has ever seen a really smart Aleck.

* * *

One of those little birds which apparently have no province in life but to make public things which are not always pleasant when told in the market place is doing a lot of piping of late. The burden of the little bird's lay is "Graft." I am not prepared to say that either this particular little bird or his especial little song are just as true as they should be, but I'm blest if some of the things the little bird sings of are not apparently borne out by corroborative evidence. At any rate, if there is anything in the theory that one's ears burn when some one is roasting their owner, then there should be a mighty warm pair of auricular appendages not a million and six miles from the corner of Fifth avenue and Fifty-eighth street.

* * *

Some people can be made to believe anything about an automobile except that they don't know anything about it.

* * *

Many an unlucky and unmechanical purchaser has found himself with an automobile whose unreliability and unsalability have made the vehicle closely akin to a white elephant on his hands. No matter how anxious such a man might be to dispose of his automobilic white elephant, however, I doubt whether even in his wildest dreams he ever thought of trading the offending vehicle off for a real, live, trick elephant! As proof that such a seemingly improbable exchange could be made, however, I reproduce herewith an advertisement clipped from the columns of a New York daily which makes a specialty of catering to swappers. This is the advertisement:

"Wanted to exchange—Topsy, a full grown elephant, for an automobile. Address Luna Park and All World's Amusement Exposition, Coney Island."

Great chance for lunatics, eh!

* * *

Dealing with the above advertisment brings to my mind another one I read in the columns of the New York daily which has been most persistent in its attacks upon the automobile and the "millionaire murderers" who employ the vehicle solely for the pleasure they find in running over and killing inoffensive "poor people." The advertisement was a boiler plate affair, showing a tousle headed female seated in an automobile, which she was steering without any regard to where she was going or how, since she was too busy reading an automobile handbook to look. Beneath this electrotypic work of art came this announcement:

"An auto blew up the other day. They are blowing up constantly. Auto wrecks are becoming common. Why? Ignorance! ignorance of their mechanism, proper care and management. Send for our free booklet, forty-eight pages of 'hints.' . . . It will prevent explosions and accidents. It will teach you in simple, non-technical language the care and management of all types of autos."

* * *

Imagine the sagacity of an individual who from the very nature of the thing he is trying to sell or give away must be interested in the growth of automobiling, printing such untruthful and alarming statements as those contained in the opening of this brilliant advertisement. Verily, automobiling has more than its fair share of afflictions similar to this one!

* * *

Advertising an automobile is very much like preaching—you have to keep at it to make any lasting impression.

* * *

One more friend of our cycling days has left the old for the new; the two wheeler for the four. The genius who has a perfect substitute for the pneumatic tire in a complicated mass of springs has had his press worker announce him as the savior of the automobile. In the good old bicycling days geniuses of this particular and vibrationless brand were so plentiful that they were classified in the nuisance calendar in bunches, their numbers preventing them from being reckoned with singly. You don't see any bicycles without pneumatic tires, do you? No; and you'll not see many automobiles without pneumatics, either, springs and geniuses to the contrary, notwithstanding.

* * *

It is not wise to believe all you hear about the wonderful record performances made by this owner and that, but at the same time it is well to use discretion in your declarations of incredulity.

THE COMMENTATOR.

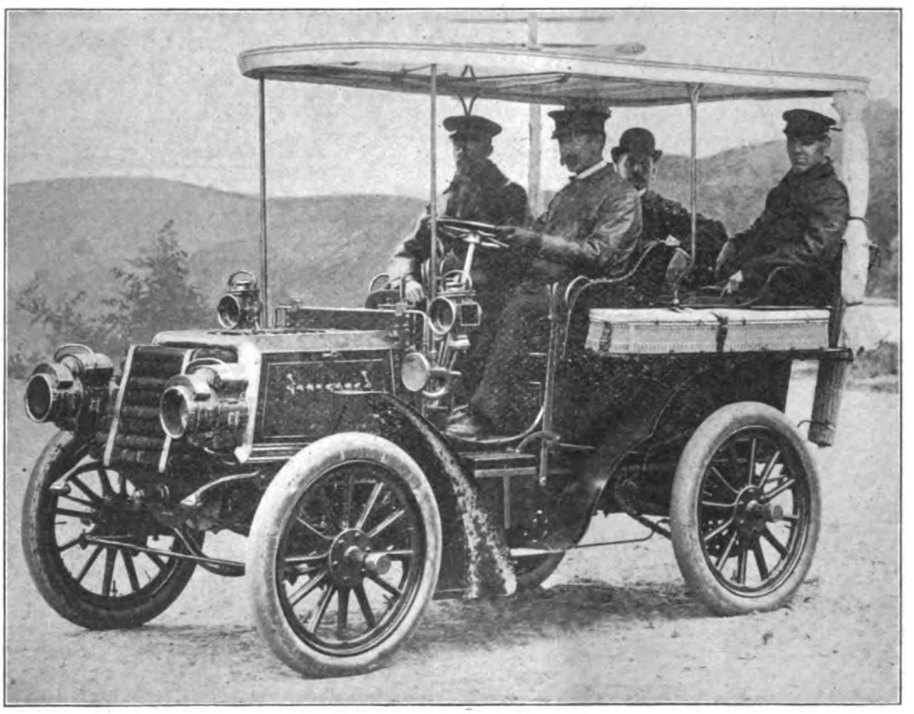
WOODBURY'S SQUEE-GEES

Waring's Worthy Successor Shows how They Contribute to Cleaner and Safer Streets.

In the frosty chill of last Saturday morning Street Cleaning Commissioner John McGaw Woodbury sallied forth at 7 o'clock to demonstrate on Fifth avenue his idea of how asphalt should be cleaned in order to make it present a gritty surface on which pneumatic tires would find enough traction to keep them from skidding and horses might get a sure foothold. It is highly creditable to President A. R. Shattuck, of the Automobile Club, to record that he was on hand in response to the Commissioner's invitation at 7:30 o'clock, in his Panhard. Paul H. Deming was there in a White runabout.

It was Commissioner Woodbury's purpose to go at the asphalt somewhat after the fashion in which it is done in London, only he had some Woodbury ideas to introduce. Chief of these was the innovation of squee-gees drawn by horses, with which the asphalt might be scraped and dried after being flushed. As the Commissioner explained, the squee-gee itself, a board with rubber on the edge, such as is used for window cleaning, is as old as a ship's deck, but so far as he knew a squee-gee drawn by horses was original with him. The squee-gees used for the purpose of the experiment were improvised affairs, put together the day before that set for the demonstration. They were simply old snow scrapers with a two-inch flange or lip of rubber projecting from the lower edge of the scraping blade. Sad to relate, they did not work effectually.



The place chosen for the experiment was the block on Fifth avenue opposite the Waldorf-Astoria, and part of the block below, between Thirty-third and Thirty-second streets. Early as it was, photographers and newspaper men were on hand, and a curious crowd of pedestrians fringed the sidewalks wondering what it all was about. It was plain that something was going on, for there was an unusual number of "white wings" on the two blocks, a section boss, two patent sprinkling carts and three of the two-horse squee-gees. Commissioner Woodbury rolled up in a steam automobile tendered him for the occasion. President Shattuck arrived soon after, and then Paul Deming.

The watering wagons first went to work to show what they could do at flushing the street instead of merely sprinkling it. The new style of carts, of which only a few are in use by the Department, are ingenious contrivances that carry water under an air pressure, so that a spray can be sent out in front, behind or to either side with considerable force. When the spray is sent out from the holes on the side of the vertical distributer that extends downward to within eighteen inches of the ground, the surface dirt and refuse are flushed to the gutter. The strength of the spray may be imagined from the fact that a brick has been carried along for a block and around a corner by the stream of water from one of these carts. The pressure in the carts is obtained in a very simple and economical way. The water barrel on the wagon is air tight and has a compartment forward, where the air is forced and cushioned simply by the entrance of the water from the hydrant. Of course the greater the water pressure the more the air is compressed and the greater the distributing force.

After the water wagons had done their work the squee-gees took the stage for their stunt. Alas, even opposite the Waldorf the asphalt was so wavy and cuppy that the straight edges of the squee-gees could hit only the high spots, and after they had gone along they left two or three streaks each a few inches wide where the pavement had been scraped. As the squee-gees ran along one could see a broad streak of daylight under them. Commissioner Woodbury stepped on the top of one of the scraping blades in order to weight it down and make it touch, but it was no use, and he shook his head mournfully as he got off and climbed into President Shattuck's car. The two automobiles tried manœuvering on the asphalt after the carts had flushed it and the squee-gees had threatened it. The vehicles were tooled along in snaky lines and turned short. When turned short the rear wheels of the little White would slew about almost in a half a circle. The big Panhard skidded some. Neither of them, however, slipped so much as they did when the experimenting party went down to Twenty-first street to try the asphalt where it had been simply sprinkled and made slimy. It was sufficiently demonstrated that the flushing is far better than the sprinkling, and also that the squee-gees are good things if they can be made to fit the uneven surface. The streaks left behind the scrapers where they did touch were dry and gritty. If the whole roadbed could have been fixed like these streaks there would have been perfect traction and no slipping.

It was a poor day for experiments of the kind, because of the low temperature. At 7 a. m. the thermometer was 35 degrees, three points above freezing. As the Commissioner said, it was only three degrees from impossibility. At 32 no washing of the street would be practicable. The water left in the hollows and even on the high spots did not dry as it would on a summer morning.

Enough was done to show that the idea of the Commissioner is a good one when properly worked out. After it was over Commissioner Woodbury remarked to the Motor World man: "Well, we have learned a great deal about the varying conditions of asphalt and how to treat them. There is no radiation this morning to help us or the demonstration would have been much better. We are going to keep at it, though, and we will get the streets cleaned eventually, no matter what we have to do. I think that I will modify the squee-gees by making them wavy like the asphalt. The edges will be escalloped and with two or three in a row on the same machine, having the escallops in counter positions, we ought to be able to hit the holes as well as the bumps. The rubber veils, too, should be longer and more flexible."

Mr. John C King, of Chicago, in his Robinson Car in which he Toured New England. Mr King is in the Rear Seat With his Chauffeur. At the Wheel is J. T. Robinson, President of the Pope-Robinson Co., at his Side is E. W. Pope, Treasurer of the Company.

TO OUTDO ROME

Colossal Project Which Includes Ten-Mile Automobile Track—Vanderbilt Interested?

A ten-mile track for automobiles is part of the roseate hued scheme for the greatest show of a sportsman's paradise on the face of the earth. Yet this little automobile course is only an incident in the grand scheme for an aggregation of running horse and trotting tracks, golf grounds, cinder paths, baseball diamond, football gridiron, bicycle track and all the rest of it, down to a croquet lawn, that is being plotted for the Hempstead plains on Long Island by H. B. Fullerton of the Long Island Railroad and a few kindred spirits, who will, according to the enthusiast named, be the nucleus of the greatest athletic organization ever known.

The recently incorporated Kings County Automobile Club, it now appears, was only one of the preliminary steps in the whole plan. The project at first flush seems too stupendous to be realized, and yet there is a world of reason in the arguments advanced by those who are behind it. It is pointed out that in a very short time all the horse racing tracks in Greater New York must be sacrificed to the advance of house builders or railroads or the progress in laying out city streets. According to Mr. Fullerton there is assurance of Whitney, Belmont and Vanderbilt money and support in the execution of a plan such as the one indicated. Fullerton says it will be a couple of years before there is any tangible development of the scheme, but the preliminary work is even now going on.

There are miles of waste level lands on the plains about Hempstead, and, after all, a ten-mile circuit would, if circular, be only a trifle more than three miles in diameter, possibly three and a half miles in greatest diameter if an oval.

The greatest objection probably would be that made by the spectators. A revolving grand stand in the centre of the infield should be built to do the thing up properly, and a pair of powerful field glasses given away with every admission ticket.

SIR THOMAS LIPTON, IN AN OLDSMOBILE, AT HIS COUNTRY RESIDENCE, OSIDGE, ENGLAND.

BULB OR REED?

Two Experts Disagree as to the Weak Points of American Horns—Their Contentions.

When experts disagree, offering antipodal explanations for an occurrence, and being equally emphatic in believing that they are correct, it is not an easy matter to decide between them.

"Why is it that practically all the automobile horns are imported?" repeated Charles E. Miller, the well known jobber of this city. "For a very simple reason, viz., that we can't make them as well as the foreigners can.

"The trouble is with the reeds. Try as we may we can't equal the French at making reeds. Theirs last forever, or nearly forever, no matter how much they are used. But ours crack and split and go wrong in every conceivable way. There's no use talking, we can't make reeds, and we might as well give up trying," and he shook his head

Digitized by Google

in such a positive way that the Motor World man came to the conclusion that it was a hopeless task.

A short time afterward, however, this view was shaken in consequence of a conversation had with R. H. Welles, of the Badger Brass Co.

"We have given up the manufacture of horns," he said, "because we find it out of the question to compete with the French makers.

"The trouble is all with the rubber bulbs. They won't stand the work they have to do. They crack or burst in a short time and thus become utterly useless. It's queer, too. Just why our rubber manufacturers shouldn't be able to make just as good bulbs as their European rivals is something that I can't understand. But such is the case, for we have tried it over and over again, and always with the same result."

Asked if there was any trouble with the reeds, Welles scouted the idea.

"The reeds are all right," he said. "We have neither trouble to get them here nor cause for complaint against them. No, I tell you it is the bulbs; you may be sure of that."

Whipple and his Packard Parted.

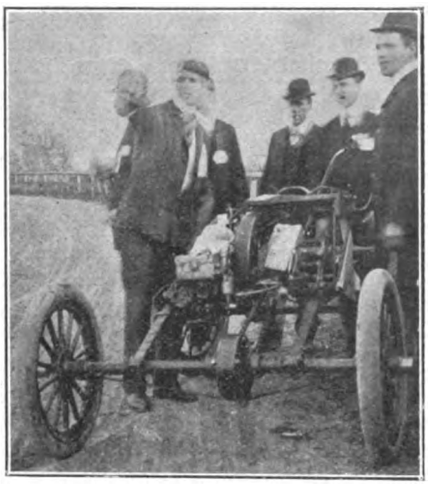
Desolation undoubtedly fills the soul of that prince of good fellows, Harlan W. Whipple. For years the Orange (N. J.) man has been an automobile enthusiast of the most pronounced type. His automobile stable is always large, but even it is insignificant by comparison with the list of cars he has owned at one time or another. And although he may tire of some automobiles he is never happy without a motor vehicle of some sort.

Last week Mr. Whipple sailed, en route for Cuba, where he is interested in some railroad enterprises. With him was to have gone his latest and most beloved automobile —the big, brass-hub Packard that is so well known by all who have even a seeing acquaintance with its owner. But it did not go, and thereby hangs a tale.

In packing up the necessary articles that form part of every traveller's kit, Mr. Whipple concluded that the "Juggarnaut" was too much for him, so the big car was handed over to the tender mercies of others —for, of course, it was to go to Cuba, too.

The "others" were, in this case, an express company, to which was intrusted the task of delivering the car to the steamer in ample time for its sailing. Equally, of course, they cut the time so very fine that the car reached the dock just in time to be too late. It is even said that additional poignancy was added to Mr. Whipple's feelings by witnessing its arrival from the deck, after the lines had been cast loose and the voyage begun.

In making a temporary electrical connection the stranded wires should be twisted up as solid as possible and the loop formed by turning the wire from left to right. When so made the loop closes in under the twisting action of the screw when tightening up the connection. If the loop be made in the opposite direction this same action spreads the wire and a bad connection results.



Springfield Banquets and Elects.

Jollity and rare good fellowship marked the annual meeting and election of the Springfield (Mass.) Automobile Club on Wednesday of last week. It was followed by a banquet, the first, it is stated, of monthly ones to be held throughout the winter.

The complete list of officers chosen was as follows: President, H. G. Fiske; first vice-president, Dr. W. R. Weiser, second vice-president, Dr. A. O. Squier; third vice-president, A. P. Smith; fourth vice-president, I. H. Page; secretary, F. A. Hubbard; treasurer, F. S. Carr; directors, Dr. H. C. Medcraft, Dr. H. C. Martin, Harry A. Knox, J. Frank Duryea, Adolph Geisel, S. L. Haynes and W. M. Remington.

The Naked Northern.

Few of the thousands of spectators who watched the Northern car tear around the track and reel off miles at the rate of 1.26, at Detroit a few weeks ago, knew that the vehicle was one of the regulation runabouts stripped for racing. Such was the case,

however. The illustration shows the car in its naked readiness, and the way it ate up space is confirmation of the Northern Mfg. Co.'s claim that its product possesses ample power as well as stamina. At the same meeting this car came into collision with the Winton "Bullet," but neither it nor Operator Maxwell were much hurt, although their escape was little short of miraculous.

Recent Incorporations.

Detroit, Mich.—The Imperial Automobile Co., Ltd., with $250,000 capital, to manufacture electric automobiles. The officers are Dr. J. B. Book, chairman; D. J. Campau, and Homer McGraw, vice-chairmen; R. O. Adams, secretary, and George J. Worthy, treasurer. Joseph Ledwinka, of Pittsburg, and Rudolphus Fuller, of Detroit, are consulting engineers, and the following comprise the advisory board: Hoyt Post, C. M. Burton, S. F. Hodge, W. T. McGraw, J. Fred Williams and A. B. McCord, of Detroit, and Charles Berg, of Chicago. Among others interested are W. D. Simons, D. J. Campau, Homer McGraw, George J. Worthy, R. O. Adams, Ralph L. Aldrich and Rudolphus Fuller, of Detroit.

About Oldsmobiles for 1903.

"The Oldsmobile for 1903?" said F. L. Smith, of the Olds Motor Works, repeating the question put to him. "It will be just as good as the Oldsmobile of 1902" he added.

"A distinctive model or any radical alterations?" again repeating the query. "Not a bit of it. It isn't the Olds policy to tinker with a good thing for the mere sake of making a change or to wait twelve months to make an alteration when the alteration is in the nature of an improvement. We would improve every month in the year were it possible. As it is, we have during the year tuned up our little runabout in several details. We do not hold such things until the end of one year or the approach of a new one. We improve as we go along, irrespective of season. As for radical departures, than ours where is there a carriage that is more eye pleasing or that is giving better service or better satisfaction? Why, then, should we even think of tearing down only to build up again? We have nothing of the sort in contemplation."

Drop Forged Dogs.

Drop forged dogs of all kinds—common dogs, straight and bent tail dogs, clamp dogs with stationary and swivel jaws, the latter for holding taper pieces, die dogs—all are described and illustrated in a new list just issued by the Billings & Spencer Co., Hartford, Conn. These dogs are drop forged of the best steel for the purpose and are fitted with hardened steel screws. They are especially designed for heavy work, and the reputation of the famous Hartford concern is sufficient guarantee of their quality.

Go From St. Louis to Florida.

A tour over roads and through territory rarely visited by automobiles is being made by Mr. and Mrs. John L. French, of St. Louis. They left the latter place last week, en route for Orlando, Fla., where they expect to join friends on a hunting and fishing trip. They will take the trip slowly, stopping at whatever points may interest them. They do not expect to reach thir destination until the middle or last of December. Their intention is to spend the remainder of the winter in Florida.

Fosdick "Goes and Does It."

Rice, wedding cake and cards have played a very prominent part in the doing of Harry A. Fosdick this week. The popular manager of the Winton Boston branch is receiving the congratulations of his friends, his marriage having taken place on Tuesday at Hackensack, N. J. The bride was Miss Lizzie Ballagh. The wedding took place at the home of her parents, at Hackensack, and the happy couple are off on a three weeks' honeymoon.

New One in Washington.

The Washington Motor Car Co. is the style of a new concern at the Capitol, of which D. L. Whitford, formerly of the Mobile Co. of America, is the moving spirit. The agencies for the Northern and Knox have been secured, and business is already doing at the temporary location, 1116 Connecticut avenue.

EXCHANGE OF OPINIONS

First of A. C. A. Tuesday Night Talks Gives Rise to Discussion of Many Subjects.

It was quite sincere and quite natural that several members of the Automobile Club of America and a couple of visitors should complain of the tediousness of fourteen miles an hour in reliability runs, and should advocate something more in the nature of a race, at the first of the Tuesday night talks, but it was unfortunate that it should go forth in the newspapers, because it gives the motorphobe such an excellent thing to bellow about.

The meeting of last Tuesday night, at the club house, on Fifth avenue, New York, was very well attended. President Shattuck being unavoidably absent, Vice-President W. E. Scarritt occupied the chair. The theme for discussion was the reliability contest to Boston and back, held in October, and some very interesting comment was made. Chairman Scarritt began proceedings by outlining the story of the run and dwelling with praise upon the signal success of it.

Suggestions being asked for, G. F. Chamberlain said he thought that a mistake had been made in not affording the newspaper men opportunity to get fuller and more accurate reports. The consequence of the policy of having observers keep their records secret was, he said, that many garbled accounts crept into the papers. He favored making public the reports of the observers at the noon and night controls. S. T. Davis, Jr., spoke in the same strain, and Chairman Scarritt heartily approved of the sentiment. He said he would advocate that in the next run, the observers be furnished books with carbon sheets, so that a copy of their notes could be posted at the noon and night controls on a bulletin board, for the benefit of the press.

Mr. Davis said he favored doing away with observers, but did not explain why. Percy Owen favored short runs of 150 miles. H. S. Chapin advocated a series of a week of runs of about 100 miles a day, going out from the city in a different direction each day, and returning at night.

E. T. Birdsall started the talk about racing. He said that the reliability of American machines has been sufficiently demonstrated, that no matter what a contest was called the public always centered its interest in the machine that got in first, and believed that it was the best machine. He said that if the vehicles were sent to Boston and back or Chicago and back, without observers and without any "funny business" of controls, it would be the best machine that got back first, not the fastest, but the best. He said it was all wrong to have to crawl on good roads and hurry on poor ones, because those were not touring conditions. Several espoused these sentiments, but Chairman Scarritt snuffed the racing talk by saying that the club stood for obedience to the law, and that present inconvenience must be endured for the sake of future good.

S. T. Davis, Jr., favored classifying machines according to price, instead of weight, because it was the price in which the buying public is most interested.

Captain Barclay H. Warburton, of the Philadelphia Automobile Club, suggested that a long distance race should be held, and the machines handicapped on the basis of their retail prices, the same as is done in selling races for horses. He said he formerly owned thirty-six horses, and that he often drove a coach-and-four along Broad street, Philadelphia, at a gallop, and from the Quaker City to New York at the rate of twenty miles an hour without ever being spoken to by a policeman, but that now, if he ventured to run an automobile at the rate of ten or twelve miles an hour, he quickly heard the policeman's whistle.

General Roy Stone said that the ordinance permitting the laying of experimntal bits of steel road in New York City had become a law that day, Tuesday, and that a steel track for trucks would be laid in Murray street, from Broadway to Church street, within a few days.

W. J. Stewart told of the thousand miles of good roads there are in the nearby counties of New Jersey, but which are little used by New Yorkers because of these being no good road from Jersey City to Newark. He asked if a steel road could not be laid across the meadows to Newark, and if the A. C. A. would not co-operate with the Automobile Club of New Jersey in having one built. General Stone suggested that probably a right of way for a private road could be obtained across the meadows, so that an exclusive automobile speedway might be built. This idea found favor, and Chairman Scarritt said that he would lay the matter before the governors of the A. C. A.

Hill Climb on Thanksgiving.

There has been much talk of hill climbing contests, but until this week, when the New Jersey Automobile Club announced that it would father such an event, nothing came of it all. Thanksgiving Day, November 27, is the date selected, and Eagle Rock hill, a few miles from Newark, N. J., will be the scene of the contest.

It is proposed to divide the contestants into two classes—for gasolene and steam vehicles, respectively. President W. E. Scarritt of the club thinks such a division would add materially to the interest of the event.

Eagle Rock hill is located in that region of good roads, the Oranges, and is about one mile long. The grade is very even for the greater part of the way, but near the end there is a turn, followed by the steepest rise, which extends to the top, a distance of several hundred feet. The gradient ranges between 14 and 17 per cent. A smooth, hard macadam surface is conducive to good time, if sufficient power is available.

CASE LAYS DOWN LAW

His Charge in Marble Matter Defines Some Points Regarding Usage of Public Roads.

Both in his charge to the jury and in pronouncing sentence in the case of Herbert A. Marble, who was convicted of manslaughter at New Haven, Conn., last week, Judge Case discussed the privileges and responsibilities of automobilists.

He pointed out that the highways are for the convenience of others, and one class must respect the equal rights of other classes. Each must consult the safety and convenience of the others, acting within the rights of their class. He also pointed out that the running of an automobile in the daytime was a very different thing from running it on a dark foggy night, and the same rules of precaution would not apply in both cases. Moreover, the ignorance of the presence of others would form no excuse, as the driver must be prepared for an emergency and must keep his machine under control. Lastly, the doctrine of contributory negligence does not apply in a criminal case as it does in a civil suit.

Judge Case then went on at some length regarding the use of automobiles on the highways. He said that the automobile was a machine which, in the hands of responsible and careful persons, was safe, but in the hands of the reckless was a dangerous machine. Unfortunately, he stated, there are too many persons who own or control these machines who use them with an utter disregard for the rights and safety of others, and they will continue to do so unless the courts show that they will uphold the rights of the people.

"It is unfortunate that there is an increasingly large class of people who measure their caution by their convenience in managing these machines, and they will continue to presume unduly on the rights of others unless the courts indicate their disapproval," said the judge in conclusion.

Foxhall Keene a Victim.

Near Oyster Bay, L. I., on Tuesday, Foxhall P. Keene was arrested, charged with illegal speeding. Instead of tamely submitting to be mulcted, he announced that he would fight the case. His car, he said, had been so geared that it was impossible to get a speed exceeding twenty miles an hour out of it.

The arrest was but one of many made at the instance of a self-appointed organization which arrogates to itself the duty of prosecuting violators of the Cocks law provided they wer automobilists.

A determined stand made by a man like Keene should shed a flood of light upon its practices.

It is an unusually sagacious child that knows enough not to smile when its father attempts to explain just how and why a motor motes or why it fails to.

POINTS OF THE PEERLESS

Convertible at Will to Racer or Touring Car and Contains Many Features of Merit.

When at the last show in Madison Square Garden the Peerless Motor Car Co.—then the Peerless Mfg. Co.—Cleveland, O., brought out its smart looking foreign type of cars, it was seen that a great deal of thought had been given to the matter, and that no small amount of skill had been brought to bear on the problems confronting the American manufacturer who takes such a course. The cars were exceedingly creditable productions. When the time came for them to receive their baptism of fire—the test of actual and extended use on the road—it was found that they did not belie their looks.

Since then the concern has been spurred on to more ambitious attempts. Last August a racing Peerless car made its bow at the races at Brighton Beach, this city, and

performed splendidly. At subsequent meets it clinched the matter by continuing to show up in excellent shape.

It is pretty well known that this racing car is to be the piece de resistance of the Peerless company's offerings for 1903. With such changes as are necessary to transform a racing car into a roadster, this vehicle will be duplicated and termed the Peerless touring car. The substitution of 28-inch for 32-inch wheels, and a tonneau body for the skeleton form then used, practically effects the change.

Except that the usual pipe coils with radiating disks appear in its front, the bonnet resembles the well known Mercedes bonnet, being square in shape. It incloses a two cylinder vertical motor, the two being cast together, as are the cylinders and cylinder heads. These cylinders are 4½-inch bore by 5½-inch stroke. Both pistons work on one elongated crankpin, it being considered that the vibration thus caused is less objectionable than that due to the irregular impulses necessary with opposite cranks, and the cranks are carefully balanced to reduce vibration as much as possible. A float feed vaporizer of modern design is used.

A centrifugal ball governor is carried on the forward end of the two to one shaft. It acts on a lever, the upper end of which connects with a throttle valve in the inlet valve casing. A rod connection from the same lever is worked by a small accelerator pedal under the operator's right foot. As the governor balls expand this pedal rises, and by pressing it down the throttle valve is held open against the action of a governor. When the foot is removed from the pedal, as to apply the brake, the governor again acts on the throttle.

The main frame is bent up in two halves of two-inch channel steel, each half forming a side sill and a half of the end sills. The two halves thus formed are joined at front and back by fish plates. But one intermediate cross sill is used, this being under the driver's seat, between the speed gear box and the muffler. It is bent downward, somewhat in an M shape. The front ends of these angle irons are bent up just forward of the motor to meet the front cross sill of the main frame.

The motor and speed gear box are supported on the false frame in the usual manner. The "pump handles" carrying the front ends of the front sprongs are riveted into the channel by side sills, instead of being made with an L shaped base, as in the French machines. The rear springs are liberally proportioned for easy riding, and will compress about four inches from their shape when fully loaded. The front springs, which can compress about three inches, are provided with rubber buffers to protect them from abnormal shocks.

A centrifugal pump is used in the new as in the former models, but it is gear driven instead of by friction, as before. The arrangement of the water tank and cooling coils is unique. The tank, which is wholly placed in front of the motor bonnet, is divided into upper and lower portions. These are connected by vertical radiating tubes, and the upper tank, into which the water is discharged from the engine jacket, has a steam outlet passing down below.

The zigzag radial tubes are patterned after the latest Panhard type, and consist of a number of very small tubes laid side by side horizontally, with the radiator flanges deep enough to include the whole set of tubes. There is no direct connection between the tank and these tubes, but the water from the pump passes to the upper ends of these tubes, thence dividing itself in multiple between them and going zigzag to the bottom, whence it passes to the engine jacket. The pump draws its water from the lower tank to which it is connected by a short downwardly sloping pipe, preventing any possible formation of steam in the pump.

The engine is lubricated principally by a multiple pressure lubricator, which feeds oil to the cylinders and crankpins. The end bearings of the crank shaft have oil pockets and ring oilers, and require only occasional refilling. The shaft bearings of the gear case, which, like the engine crank case, is of aluminum, are oiled in the same way, there being an entire separation between shaft lubrication and the oil in the gear box itself.

The gasolene tank under the seat is made to hold nine to twelve gallons, at the option of the purchaser. About five and one-half gallons of water are carried. The touring machine is geared to run thirty miles an hour at 900 revolutions per minute of the engine, at which speed the engine is rated to give 16 horsepower. This, of course, is without acceleration.

Ignition is by jump spark, with Splitdorf coils and De Dion dry batteries.

Why he Likes Renting.

"Does renting pay, and is there much of it?" repeated W. H. Webster, of the Webster Automobile Co. "I should say so. Any one who bids for it can in a little while get all he can handle and at paying prices.

"We have been at it only a short time, but have built up a good trade," he went on. "In fact, it was owing to it that we took on our new place at No. 346 West Fifty-third street. We hadn't room to handle a renting business here, so were obliged to hire a place where we could.

"We charge $3 for the first hour and $2 an hour thereafter. This is with a chauffeur, of course. No, we never hire a rig without our man to run it; wouldn't do it at any price, no matter how experienced or expert the hirer might be—or claim to be. No chauffeur no rig, is our motto, and it is a good one. We would not deviate from this practice unless we had deposited with us the full value of the carriage.

"Where do people go? Oh, to the Park or around town to make calls or to do shopping. It's quite a novelty to do this in an automobile, and therefore we have plenty of applicants.

"We have had a man pay us as high as $16 in a day for hire. Such amounts as $6 and $8 are not at all unusual. You see, when it is borne in mind that two or even three passengers besides the chauffeur can be carried in one of our Prescott rigs, which we use for this purpose, and that a great deal of ground is covered, the charge is not really high."

THE AUTOPHOBE ASSOCIATION

The Working Plan and the Men Behind the Long Island "Crusade" Finally Revealed.

The Motor World has at last discovered the personnel of the organization behind the prosecution of automobilists in Nassau County, Long Island—the people responsible for the measured road, the tin can and sleigh bell signals and the corn fodder constables with stop watches hiding in the woods. The select gentlemen responsible for these tactics compose the Long Island Highway Protective Society, under which name all forms of motorphobia on Long Island may henceforth be known.

This organization is by no means new, but it is not generally known, because it is select and has been chary about revealing itself to any except those who were reasonably sure to be in sympathy with the hide-in-the-woods-and-grab 'em plan.

The Long Island Highway Protective Society has been in existence since last summer. It was incorporated in September. It has been busy catching the class of criminals who use automobiles ever since it was formed, but thus far it has not caught any one driving a horse faster than eight miles an hour, although the declared purposes of the society is to prevent illegal speeding by reinsmen as well as chauffeurs. That is, it declares that object in the preamble of its constitution, and also in the first part of a circular letter which is being sent to Long Islanders suspected of motorphobia, but in the second paragraph the writer of the circular comes out with quite charming naivete and says that after all it is really the automobile that the society has it in for. This is the way the circular reads:

"The Long Island Highway Protective Society has just filed articles of incorporation, and entered on an important work indicated in its name. In plain English, it intends to organize the dwellers on Long Island for the purpose of securing greater safety to all who use its highways and wage war on all who usurp the public's rights and privileges thereon by rendering the highways dangerous through the reckless driving of machines or teams.

"One of the avowed objects of the society, as set forth in its articles of incorporation, is 'to support and co-operate with the public authorities in the enforcement of the law and statutes governing the use and operation of motor vehicles and riding and driving.' Stripped of its legal phrases, this means that the society intends to keep a guardian eye on the rights of the general public to Long Island's highways as against their lawless and reckless use by automobilists.

"Since the use of high power automobiles became so general, Long Island has become the Mecca of the 'scorchers,' and the craze for speed on the part of many thoughtless owners of machines has grown into so serious a menace to pedestrians and horsemen that many experienced drivers no longer frequent the macadamized highways, and in many localities driving by women has been practically abandoned. This society is accordingly organized to abate the nuisance, but not to wage an indiscriminate warfare on automobiles. Its incorporators believe that a majority of those who have these machines will sympathize with them, and they expect that many of them will become members of the society. But the offenders, who behave as if they held private ownership of the roads, who speed recklessly, who drive madly through village streets and around corners, who respect none of the rights of pedestrians or horsemen, will no longer be tolerated. War is to be waged against all such offenders.

"The nucleus of the society has been in existence for some weeks, and in Nassau County particularly has most effective work already been done. Here courses have been measured on the principal thoroughfares. Wardens charged with the detection of offenders have been appointed, and attorneys whose business it is to prosecute violators of the law have been retained. The cost of this work is not paid out of the fund raised through membership fees, but by the several branch divisions within the society, each within its own locality. The membership fund will be used for the general purposes of the society only.

"The headquarters of the society are at Oyster Bay, and those who entered on the work at first expected to confine their energies to Nassau County. But when so great an interest was shown, and when the conditions in Queens and Suffolk counties were found to be similar to those in Nassau, it was decided that the scope of the society should be extended over the entire island. Membership is based on the single condition of interest in protecting the highways for the public. The incorporators extend an invitation to all who can subscribe to that condition to join with them. The annual membership fee is $5. Committees which have been formed in villages for purposes similar to those of the society also cordially are invited to co-operate with it."

The work of taking in motorphobes at $5 a head goes merrily on, and the constables get a "rake off" on every arrest they make.

Meantime it is just as well for automobilists to know the distinguished gentlemen who are behaving in such an enlightened and manly way to have the law enforced especially against automobiles as a class. Here they are:

Incorporators—William F. Sheehan, Walter Jennings, William H. Baldwin, jr., Albert W. Seaman, Irving Cox, C. W. Wetmore, Charles A. Post, L. J. Busby, Townsend Scudder, Edward T. Cushing, John H. J. Stewart, Vincent P. Travers, W. Emlen Roosevelt, Arthur D. Weekes, W. J. Matheson, Francis K. Thayer, John W. Weed, Robert W. Gibson, Franklin B. Lord, C. W. Rodman, jr., Charles G. Peters, T. S. Young, jr., and A. P. Montant.

Officers—Charles W. Wetmore, president; Robert W. De Forest, vice-president; W. Emlen Roosevelt, treasurer, and Townsend Scudder, secretary.

Directors for the first year—R. W. Gibson, William F. Sheehan, William J. Matheson, Thomas S. Young, jr., George R. Sheldon, William H. Baldwin, jr., W. Emlen Roosevelt, William J. Youngs, Arthur D. Weekes and C. W. Wetmore. Former Representative Townsend Scudder is the society's counsel.

A French Innovation.

A GASOLENE-DRIVEN TROLLEY REPAIR WAGON

Feared It Would Explode.

There was one thing about the freak steam racer, "The Tug," which made its appearance at the Detroit races, that puzzled observers. This was the vagaries of its steam gauge. It registered a most wonderful, nay, an alarming, pressure, frequently getting up as high as 2,000 pounds.

A group of tradesmen were looking at the queer car as it was standing between races. Among them was Fred Mott, of the Weston-Mott Company, who was examining the engine intently. Suddenly his eye fell on the steam gauge. It indicated 2,000 pounds. Mott made one bound away from it, and then ran as fast as his legs could carry him. "And the funny part of it was that it did not explode," he confided to the Motor World man, when he had recovered from the shock.

Short Circuits

The Massachusetts Automobile Club will begin its series of smokers this month.

John P. Drake has been appointed manager of the Empire Automobile Storage Co., New York.

An automobile storage warehouse has been opened at 248 West Fiftieth street, New York, by C. F. Keulebler.

The agency for the Baker electric vehicles has been given to the American Automobile Storage Co., West Thirty-eighth street, this city.

An addition to the ranks of Western manufacturers is the Muncie Wheel & Jobbing Co., Muncie, Ind., who are at work on a gasolene automobile.

James A. Turnbull, a Springfield (Mass.) automobile dealer, last weeek filed a bankruptcy petition. His debts amount to $2,538 09; assets, $1,600.

So much improved is the condition of A. C. Bostwick, the well known racing and club man, that he is expected to be out of Dr. Bull's private hospital in a short time.

By agreement between counsel, George S. Taft, of Worcester, Mass., has been appointed auditor in the case of John C. Speirs versus the Locomobile Company of America.

Panhard & Levassor, the famous French makers, are reliably reported to have orders amounting to $482,500 booked for 1904 delivery. They are already "sold up" for 1903.

Flushed with his successful attack on the existing record, Henry Fournier is now eager to race W. K. Vanderbilt, Jr., for the "championship of the two great Republics."

Rudyard Kipling is one of the latest to enroll himself in Great Britain's Volunteer Automobile Corps, which now numbers 130 members. They constitute a sort of automobile militia.

Contracts have been let for the conversion of an old church property at Newtonville, Mass., into a modern garage, to be occupied when completed by F. J. Read. Room to store seventy-five cars will be provided.

The first hill-climbing competition of the Auto Club of Switzerland took place last month, between Trelex and St. Cergues. The distance was ten kilometres, and good times were obtained in the speed section, which, however, was poorly represented. Perrot, on a Rochet-Schneider, won the light cars class; and Mauthen, on a Mercèdès, the heavy cars class in 25 minutes.

Although not generally known, the famous Mercedes car takes its title from a woman, Miss Mercedes Jellinec. She is a daughter of M. Jellinec, a director of the Cannstadt firm, who was largely concerned in the design of the car.

The store on 38th street, just west of Broadway, this city, formerly occupied by the American Electric Vehicle Co., is now tenanted by Homan & Schultz. The latter are making a strong push on the Northern gasolene runabout.

One of the oldest livery stables in Providence, R. I., is to be torn down and an automobile station erected in its place. It will, when completed, be occupied by the Providence branch of the American Cycle Mfg. Co.

Saturday, December 6, is the date set for the opening "smoke talk" of the Rhode Island Automobile Club. Meetings will be held throughout the winter season at the club's headquarters, in the Crown Hotel, Providence.

After giving a number of the aldermen a demonstration of the harmlessness of the motor vehicle, the Kansas City (Mo.) Automobile Club last week took part in a hearing to consider the ordinance now before the municipal bodies.

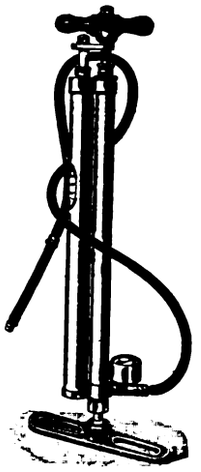
Negotiations are pending between citizens of Waterloo, Iowa, and Charles E. Duryea, of Reading, Penn., looking to the establishment of an automobile factory in the former place. Visits have been exchanged, but nothing definite has yet been done.

The Philadelphia postal authorities are experimenting with an automobile wagon on the route between the main office and Darby, a suburb about six miles out. Formerly trolley cars did the work, but the automobile is said to have covered the distance in much faster time.

There will be the customary banquet of the National Association of Automobile Manufacturers during the automobile show at Madison Square Garden in January. The entertainment committee consists of P. H. Deming, Percy Owen, H. W. Leonard, O. J. Woodard and J. Gibbs.

Chicago chauffeurs are reported to be about to form a union, with a view of securing shorter hours and less work. They will refuse to wash wagons, but will consent to pilot them and generally supervise all necessary repairs. For working more than eight hours a day they will demand extra pay.

The colony of automobile storage houses in this city is being constantly added to. One of the latest entrants into the field is the Metropolitan Motor Car Co., which has leased part of a four story bulding on East 57th street, and will take possession on December 1. Harry Doty will be in charge.



One stage of advancement has been reached by the automobile ordinance now before the Pittsburg, Pa., councils. Select Council passed the bill last week. It provides a maximum speed of seven miles down town, ten miles on most of the other streets, and fifteen miles on the outlying boulevards.

There are limits to credulity, it seems, for the story of Elisha Caddick, who was found lying injured on a road near Meriden, Conn., last week, that he had been run over by an automobile was viewed with suspicion. Now it turns out that two boys saw him fall from a bridge. And so sympathy is denied him.

"To get rid of a generally mispronounced foreign term, why could not the word 'runner' be used instead of 'chauffeur' for the driver of an automobile?" suggests an automobilist. "'Runner' is in use in some parts of the West for 'engine driver' or 'engineer'; it might be applied with equal suitability to the person running an automobile."

Inflates in Three Strokes.

Of pumps that should appeal to automobilists, that shown by the accompanying illustration, and for which Alex. Schwalbach, 473 Flatbush avenue, Brooklyn, N. Y., is sole American agent, appears to have particularly strong claims. It goes a step beyond the double-action pump, and, as its name implies, is a compound article. It has two cylinders or barrels, one an inch and a

quarter in diameter and the other two inches. Both barrels are nineteen inches long and the total length of the pump, including a double handle and a double foot rest, is twenty-three inches.

On the up stroke air is compressed from the larger cylinder into the smaller and the down stroke forces this compressed air from the smaller barrel into the tire, where it expands. One who has tried it says that an entirely flat tire can be inflated with three strokes. The pump is an English invention, but one fully covered by American patents.

NEW OIL MOTOR

With Impluse Every Revolution, Suggested by British Authority—Present Types Reviewed.

Before the British Institute of Mechanical Engineers, held a short time ago, Captain C. C. Longbridge, a member of that body and everywhere recognized as an authority on subjects connected with the modern motor car, read a paper entitled "Oil Motor Cars of 1902," extracts from which are appended.

As will be seen, Captain Longridge has reached the conclusion that the times are ripe for the introduction of a new oil motor. He bases this conclusion on the imperfections of the present types. Since the days of Daimler and other early inventors, he says, no great novelties have appeared, and very little real advance has been made. A motor in which an impulse takes place at every revolution is the ideal one, he thinks. With the Briton's general conclusions—that is, that a new motor is needed and will come—American workers in the field, notably Charles E. Duryea, concur, as is well known.

"With very few exceptions, petrol car engines are of the vertical single acting Otto type. Variations are made consisting chiefly of horizontal Ottos, or, more often, horizontal motors, in which one cylinder contains two pistons, between which explosion takes place, such as the Koch, Gobron-Brillié, Prétot, Hyler-White, Lucas and a number of others," he begins.

"There are two prevailing positions and two classes of engines. As regards position, the vertical is far the more common. From the standpoint of the automobile engineer the case stands thus: Advocates of vertical fixing assert better accessibility and adaptation to the usual method of drive; those of the horizontal claim less vibration (the impulse being at right angles to the spring system of the vehicle), lower centre of gravity, easier lubrication and room for a longer stroke—a requirement for the use of alcohol and heavy oils. They might also appeal to the almost universal practice of gas and oil engine makers. Between the types of engines the comparison stands thus: Simplicity, and probably economy, lie with the single acting Otto; a greater smoothness of running with the one cylinder two piston type. From the persistency and extension of its use it is clear that manufacturers consider this latter advantage to more than compensate for increased complication, which, after all, in these small motors, is not so great.

"The author himself holds that neither type is going to stay. The ultimate evolution will be the impulse every revolution engine. The aim of manufacturers is obviously toward elimination of change speed gear by increasing the flexibility or elasticity of the motor. The car explosion motor has to be more and more assimilated to the character of the steam engine. To this assimilation there is only one successfulroad. To obtain steady running from the highest to the lowest speed the impulse must be multiplied; and as thet number of cylinders is limited—the fewer the better—recourse must be had to the impulse revolution motor. In this belief, the author has recently patented an engine in which impulse in every cylinder is obtained at every revolution. The cycle is exceedingly simple, and, as high compression is used, efficiency and economy should result. The motor consists of two, or multiple of two, side by side cylinders, closed at both ends. The rear end forms the compplace; the front end is an air receiver. The front nd or air chamber of each cylinder is connected by a pipe or passage to the rear pression chamber, in which explosion takes end or compression chamber of thet other cylinder. This tube or passage is provided at both ends with valves, and serves to transfer air from the air chamber of the one cylinder to the compression chamber of the other. The compression chambers are provided with ample exhaust valves, and the air chambers are fitted with automatic inlet valves. All other valves are mechanically operated. The oil, atomized by a small compressed air jet, is fed, under control of the governor, into the combustion chamber, at the end of the compression stroke.

"The action is as follows: Assume the piston in No. 1 cylinder to be at the end of its compression stroke, and that in No. 2 cylinder at the end of its working stroke. The front of No. 1 cylinder is full of air; the rear of No. 2 cylinder is full of burnt gases. The compressed charge in No. 1 is now carburetted and fired, the piston advances, compressing the air in front; the piston in No. 2 retreats, expelling the waste gases. At about half stroke the exhaust valve in No. 2 is closed and simultaneously the inlet valves (one at either end of the inlet tube) are opened, and the full charge of air, already under compression, is pumped from the front of No. 1 cylinder into the compression chamber of No. 2. On the completion of the No. 2 cylinder compression stroke atomized oil is injected (the Diesel engine illustrates the method) and is fired; at starting, by the electric spark, and afterward, perhaps, by hot surface contact ignition, oil injection can be effected at once or gradually, as desired.

"The advantages claimed are:

"1. Impulse every revolution in each cylinder without extraneous pumps.

"2. Very perfect cushioning and easy running.

"3. Very high compression, with diluted charge, and, therefore, economy.

"4. Absolute immunity from premature ignition—a factor that militates against high compression in other engines.

"5. High charge temperature of the charge, without corresponding rarefaction; therefore very favorable conditions for easy ignition rapid inammation anad high power.

"6 A method of oil injection that admits of the engine being run as an explosion at constant volume engine, or a combustion at constant pressure engine

"7. Equal adaptability to petrol or heavier oils.

"Nearly two years ago, recognizing the possibly even beneficial effect of the presence of exhaust gas, and the great value of maintaining the compression, the author strongly recommended a motor company with which he has some connection to adopt governing on the exhaust (i. e., reducing the volume of fresh charge by retaining a portion of the exhaust), in preference to volume throttling. Mr. Frederick Grover, in 1894-'95, conducted experiments which bear out the views held by the author. The general results 'show that the presence of the products of combustion in certain mixtures actually raises rather than diminishes the maximum pressure obtained.'

"1. That the highest pressures are obtained when the volume of air is only slightly in excess of the amount required for complete combustion.

"2. That higher pressures are recorded when residual gases take the place of an excess of air.

"3. That when the volume of the products of combustion does not exceed 58 per cent of the mixture, then it is explosive, provided that the volume of air is not less than 5.5 times the volume of coal gas.

"4. That the time of an explosion is much reduced when excess of air is replaced by products of combustion.

"Whether these observed facts are due to increased temperature or to some chemical action is a point open to argument.

"Reduction in fuel consumption is the great advantage of increased compression, or, to state it otherwise, in any gixen mixture, the explosion pressure produced by ignition is proportional to the charge compression. In practice there are, of course, limits to the degrees to which the charge can be usefully compressed. These limits are fixed mainly by four conditions: First, the difficulty of keeping piston and valves tight; second, the necessity of seeing that the negative work and the increased friction due to high compression do not exceed the greater efficiency obtained (the ratio of incrase in efficiency decreasing as the pressure is increased); third, the desirability of avoiding the excessive shock of a rich charge fired under high compression; fourth, the risk of premature ignition in a highly compressed charge.

"In the matter of piston speed this year's engines show a general return to the earlier speeds given by 700 to 800 revolutions per minute normal running. This gives less wear and tear on the motor, gear and firing accessories, and less difficulty in filling the cylinder; while reserve power by acceleration is held in hand. In respect to slow, yet steady action, the impulse every revolution motor would possess a decided superiority.

"On the whole, the author sees no great novelty either in the types of engine, and very little real advance since the days of Daimler or early inventors. There is undoubtedly room for a new engine, and a ready market for a good one."

MUST WEAR BADGES

Pennsylvania's Capital City Drafts Law That Piles More Agony on Automobilists.

Determined, apparently, to be in the fashion, the Common Council of Harrisburg, Pa., has under consideration an automobile ordinance which has for its principal feature a licensing scheme.

It provides that all operators of "automobiles, autocars, or other similar vehicles," shall be licensed by a specially constituted body, consisting of the Highway Commissioner, the City Electrician and the Chief Engineer of the Water Department, termed the "Board of Examiners of Operators of Automobiles." It is required of the operators that they wear a metal badge, containing their number, pinned to their coats in a conspicuous position.

Aside from this the ordinance is oppressive unnecessarily so. It prescribes a maximum speed of seven miles an hour, with four at crossings, and makes it compulsory to fit two brakes, of sufficient power to stop a car in ten feet when going at the maximum speed. Altogether, the measure is a most aggravating one.

Its provisions are as follows:

An ordinance to regulate and license the running and operating of automobiles and motor vehicles, whether the motive power be electricity, steam, compressed air, naphtha, gasolene, kerosene, or any source of energy other than human or animal power.

Section 1. Be it ordained by the select and common councils of the city of Harrisburg, and it is hereby ordained by authority of the same, That hereafter no automobile, auto car or other similar vehicle shall be propelled or driven upon or along any street, alley or other public highway in the city of Harrisburg unless the person in charge or control of such vehicle, and who is acting as the operator thereof, shall be a person duly licensed by the city of Harrisburg to act as an operator of such vehicles, in the manner hereinafter provided; aand for the purposes of this ordinance the terms or names "automobile," "auto car," anad other similar vehicles wherever and whenever used in this ordinance shall be held to embrace and mean, and are hereby defined to mean, any vehicle driven or propelled upon or along the streets, alleys or other public places of the city, whether for purposes of business or pleasure, or for both, the motive power of which is electricity, compressed air, naphtha, gasolene, kerosene or any source of energy other than human or animal power; Provided, however, That nothing herein shall apply to the operation of any locomotive, motor or trolley car used by any steam or street railway upon any track or tracks owned or authoritatively used by any steam or street railway company or corporation.

Sec. 2. That the Highway Commissioner, the City Electrician and the Chief Engineer of the Water Department shall be, and they are hereby constituted, a Board of Examiners, who shall be officially known and described as the "Board of Examiners of Operators of Automobiles"; and it shall be the duty of such Board of Examiners to examine into the qualifications, ability and capacity of any person or persons who may desire to obtain a license or certificate of qualification to operate any such automobile, auto car or other similar vehicle. The said Board of Examiners shall have power and authority, and it is hereby made its duty, to examine into the qualifications and fitness of any applicant for a license or certificate of qualification to act as an operator under the provisions of this ordinance; and to carry out the purposes of this ordinance the said board may make such rules and regulations as may be deemed by it expedient or necessary for the purpose of determining the fitness of any applicant for a license or certificate of qualification; and the said Board of Examiners shall hold examinations as often as may be deemed necessary, in the office of the Commissioner of Highways, and such examinations shall be conducted with a view to ascertaining the physical ability, mental qualifications and possession by the applicant of a sufficient amount of mechanical knowledge and ability to understand the working parts or mechanism of the apparatus used for propelling or driving any such automobile, auto car or other similar vehicle.

Sec. 3. Every application for a license or certificate of qualification hereunder shall be made to the said Board of Examiners, and shall set forth the name, age, citizenship and occupation of such applicant. Any applicant who shall have been examined by the said Board of Examiners and deemed by it capable of acting as an operator as herein provided, shall have issued to him or her a certificate of qualification or license authorizing the person so examined and found capable to act as an "automobile operator," and each such license or certificate so issued shall expire upon the first Monday of April next after the date of issue. The said licensed operator shall also be furnished with a metal badge having a number thereon corresponding to the number on the certificate given. Said badge shall be provided with a pin or other fastening and shall be worn by such licensed operator in a conspicuous place on the outside of the coat so that it may not be hidden either by accident or design.

Sec. 4. The fee for such license or certificate of qualification shall be $2 for the first year or part thereof, and upon the expiration of any such certificate or license the holder thereof shall be entitled to a renewal of such certificate or license each year thereafter, without further examination, upon the payment of a fee of $1 for each such renewal.

Sec. 5. Every license or certificate of qualification issued by the said Board of Examiners shall be signed by all or a majority of said board, and may be revoked upon finding that the person holding any such license or certificate has proved unfit to act as an operator, either by reason of carelessness, intemperance or any other cause deemed sufficient by the said board to require a revocation of the same; Provided, however, That no person shall have his or her certificate or license permanently revoked without first being given an opportunity to be heard by the said Board of Examiners in his or her defence. Such revocation may be made for a limited period or permanently as the said board may determine, and in case of the revocation of any such license or certificate the fee paid therefor shall be forfeited to the city.

Sec. 6. The Board of Examiners herein provided for shall cause to be kept a full and correct record of its official proceedings, including the names of the members of the said board, the name, age and residence of each applicant for a license or certificate, the number of certificates issued or rejected, the number of certificates renewed or revoked, and the cause of such revocation, together with the name of the person whose license or certificate was revoked; also, the amount of money received for licenses, and shall cause a full report of said license fees to be made each month to the City Controller, and settlement of said fees made in accordance therewith with the City Treasurer.

Sec. 7. No automobile, auto car or other similar vehicle shall be propelled or driven upon or along any street, alley or public pace in the city of Harrisburg at a speed exceeding seven miles per hour, and at a speed not exceeding four miles per hour when turning corners or crossing any highway within the city, and each vehicle when in motion must be kept to the right, and shall observe the rule of the road as laid down for all other vehicles.

Sec. 8. Each and every automobile, auto car or other similar vehicle driven or propelled upon or along any street, alley or public way in the city of Harrisburg, shall be equipped and applied with an alarm bell or gong of not less than four inches in diameter, and the same shall be sounded at street crossings and whenever else deemed advisable by the operator of such vehicle to be sounded for the purpose of notifying pedestrians or others of the approach of such vehicle. Each automobile, auto car or other similar vehicle shall be equipped with at least two brakes or sets of brakes, one of which brakes or sets of brakes shall be independent of the driving gear of such vehicle. Either of said brakes or sets of brakes shall be of sufficient power when applied to bring any such vehicle, at a speed of seven miles per hour, to a full stop within ten feet from the point such vehicle was when such brake was applied; and all such vehicles shall carry a lighted lamp or lamps in a conspicuous position on such vehicle whenever in motion on any street, alley or public way, at any time after dusk and before dawn. No part of the machinery of any automobile, auto car or other similar vehicle shall be left running while such vehicle is standing in any street, alley or public way without an attendant.

Sec. 9. No person shall operate, drive or propel any automobile, auto car or other similar vehicle upon or along any street, alley or other public way in the city of Harrisburg without having first obtained a certificate of qualification so to do and a proper badge therefor as hereinafter provided; and any person violating any of the provisions of this ordinance shall, upon conviction thereof, be fined not less than $5, nor more than $25 for each offence; and in default of the payment thereof shall be imprisoned in the jail of Dauphin County for a period not exceeding thirty (30) days.

Sec. 10. All ordinances or parts of ordinances inconsistent herewith be and the same are hereby repealed.

The Week's Patents.

712,196. Motor Vehicle. William J. Lane Filed March 8, 1902. Serial No. 97,355. (No model.)

and George Lane, Poughkeepsie, N. Y.

Claim.—1. In a motor vehicle, the combination with a vehicle body, a motor supported on said body, a steering axle fixed to the body, a driving axle longitudinally adjustable relative to the body, a power transmission means between the motor and the driving axle and an extensible reach interposed between the axles for altering the distance between them.

712,329. Engine for Motor Vehicles. Charles R. Pflaging, Baltimore, Md., assignor of one-half to Orlando L. Gooden, Baltimore, Md. Filed Aug. 4, 1902. Serial No. 118,226. (No model.)

Claim.—1. In a steam engine of the type described, the combination with the cylinders, the crank shaft, and the driving connections as described, of a shaft projecting at right angles to and driven by the crank shaft; a sleeve keyed on the outer end of said shaft and adapted to be moved a limited distance longitudinally thereon, said sleeve having a gear wheel on each end thereof, a pinion mounted upon a shaft and always in mesh with one of said gear wheels; and means to move the sleeve longitudinally on the said shaft.

712,484. Metal wheel. William P. Bettendorf, Davenport, Iowa. Filed October 22, 1900. Renewed July 25, 1902. Serial No. 116,886. (No model.)

Claim.—1. In a metal wheel, a hub having two annular metal plates the radially disposed portions of which are clamped together and have sockets formed between their meeting faces, in combination with metal spokes the inner end portions of which between their inner extremities and the part thereof outside of said sockets, have lateral projections, which, when said plates are clamped together extend through the wall of the sockets.

712,542. Carburetter for explosive engines. Thomas B. Jeffrey, Chicago, Ill. Filed October 29, 1900. Serial No. 34,798. (No model.)

Claim.—1. In a carburetter, a chamber containing the carburetting liquids; a capillary web or screen, and suitable supports therefor; a rotary shaft by which the screen is given movement into and out of the liquid; a ratchet rigid with such shaft; a pneumatic motor, and a pawl connected with its moving elements and engaging with a ratchet; and a source of pneumatic pulsation communicating with the motor.

712,546. Motor vehicle. Oliver W. Kelly, Springfield, Ohio. Filed May 31, 1902. Serial No. 109,673. (No model.)

Claim.—1. The combination with a carrying platform and the axles of a vehicle, of supports for said platform consisting of transverse frames having slotted ends therein, two part bearing blocks, the lower part adapted to engage said axle and rounded on top to receive the correspondingly rounded bottom of the upper part, said blocks being adapted to fit and move in said slots, carrying springs in said slots engaging said frames and carried by said bearing blocks, substantially as specified.

712,583. Controlling mechanism for motor vehicles. James W. Packard and William A. Hatcher, Warren, Ohio, assignors to Ohio Automobile Company, Warren Ohio, a corporation of West Virginia. Filed February 12, 1902. Serial No. 93,756. (No model.)

Claim.—1. The combination with a driving shaft and a parallel driven shaft, each having gears thereon and rotatable therewith, the gears upon one of the shafts being adjustable lengthwise thereof into and out of engagement with co-operating gears on the opposing shaft to effect change in speed, of devices for shifting the movable gears comprising a reciprocative cam plate having cam slots or grooves therein, and shifting arms engaging said slots and adapted to move the gears.

712,588. Adjustable bearing for wheels. James A. Plopper, Chicago, Ill., assignor to Plano Manufacturing Company, Chicago, Ill., a corporation of Illinois. Filed March 22, 1902. Serial No. 99,451. (No model.)

Claim.—1. In a device of the class described, the combination with the bearing member having the cam flange thereon, of the base piece having a lug adapted to cooperate with said flange, and means for clamping the bearing member securely in any desired position of adjustment on the base piece.

712,717. Electric motor. Oscar H. Pieper, Rochester, N. Y. Filed December 4, 1901. Serial No. 84,614. (No model).

Claim.—1. The combination with an electric motor having field magnets and coils, an armature, commutator and commutator brushes, of a transformer independent of the field coils or magnets, having its primary connected in series with one of the windings of the motor and its secondary in series with the other.

712,733. Steel spring tire for vehicles. John A. Shearer, Schenectady, N. Y. Filed October 31, 1901. Serial No. 80,586. (No model.)

Claim.—1. A yielding tire formed of sheet metal segments having T-shaped slots on each side and bent into tubular form and having the slotted sides thereof joined together at the inside of the tire.

712,739. Electric spark generator. Joshua Struthers, Des Moines, Iowa, assignor to J. F. Crosby, Des Moines, Iowa. Filed March 10, 1902. Serial No. 97,422. (No model.)

Claim.—1. An improved electric spark generator, comprising in combination, a field coil, an armature rotatably mounted in the field coil, a commutator on the armature shaft, brushes in engagement with the commutator, binding posts mounted on the machine frame and electrically connected with the commutators, a metallic bar mounted on the machine frame and capable of engaging both binding posts at the same time, a centrifugal governor on the armature shaft, and means whereby, when the governor is thrown outwardly by centrifugal force, the bar will be moved into position in engagement with both binding posts, for the purposes stated.

712,791. Muffler for internal combustion engines. Carl C. Hedstrom, Portland, Conn., assignor to George M. Hendee, Springfield, Mass. Filed October 28, 1901. Serial No. 80,192. (No model).

Claim.—In a muffler having closed ends and a discharge opening in one of said ends, the combination of a deflecting plate secured by one edge to said end, and having its opposite edge in close proximity to the surface of said end, whereby the gases are turned from their normal line of discharge and are deflected to issue from said plate in opposing directions, in the same plane.

712,805. Explosive engine. Whitcomb L. Judson, Chicago, Ill. Filed April 25, 1901. Renewed July 3, 1902. Serial No. 114,272. (No model.)

Claim.—1. A multicylinder explosive engine having its cylinders connected in an endless series by flame ducts, the last of which connects the last cylinder with the explosion chamber of the first cylinder, whereby the charges in the several cylinders are exploded in a continuous recurring order.

712,825. Motor car or other vehicle. James F. Mason, London, England. Filed July 29, 1902. Serial No. 117,442. (No model).

Claim.—1. In a road vehicle or the like means for preventing the inrush of dust laden air consisting of a deflector supported above the body of the vehicle for deflecting the air current produced by the motion of the vehicle against the inrushing current of dust laden air.

712,829. Motor vehicle. John E. Millard, Poughkeepsie, N. Y. Filed August 12, 1902. Serial No. 119,431. (No model.)

Claim.—1. In a motor vehicle, the combination of a frame having a longitudinal central, horizontal lug at its forward end, and one or more horizontal, longitudinally disposed lugs at its rear end, a front axle having a horizontal, longitudinally disposed bearing at its middle receiving the forward lug of the frame, a rear axle having one or more horizontal, longitudinally disposed bearings loosely receiving the rear lug or lugs of the frame, whereby the said rear axle is adapted to be adjusted with respect to the frame suitable means connecting the frame and the front axle, and one or more adjustable connections between the frame and the rear axle.

712,875. Vehicle wheel. Sidney B. Whiteside, New York, N. Y., assignor to Whiteside Wheel Company, Limited, Grand Rapids, Mich. Filed February 8, 1902. Serial No. 93,178. (No model.)

Claim.—1. A vehicle wheel consisting of a rim, a hub in two parts separated on a plane transverse to the axis, two sets of spokes connecting the rim with the respective parts of the hub, means whereby said parts may be adjusted in a circumferential direction with respect to each other, each part being provided with corresponding circular rows of teeth adapted to line up with each other, and a ring adapted to engage with both rows of teeth to lock the parts of the hub against relative movement.

TRADE MARKS.

39,212. Rubber tires for vehicles. International Automobile and Vehicle Tire Company, New York, N. Y. Filed September 26, 1902.

The word "Endurance." Used since October, 1901.

INFORMATION WANTED

We want to learn all we can about the horseless carriages which were made in this country from eight to twenty five years ago. These old automobiles, even though they may have been in advance of the times, are legitimate parts of the history of the development of the automobile in the United States, and many of them, we believe, embodied characteristics of construction now in use, for which some one other than the true inventor is receiving credit. Address,

"HISTORY" care Motor World.

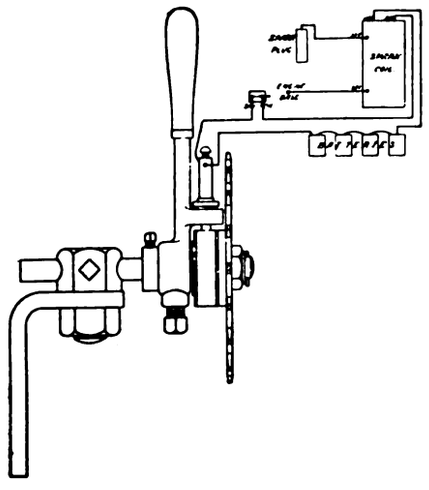
The Folly of Haste.

"You never see a really competent driver of a steam car start off quickly and push his car to anything like its full speed at first," remarked an automobilist. "It is only the novices who do such things.

"Your good operator knows that even if he is in the biggest possible hurry he will attain his object best by going slowly at first. It is really a case of 'the more haste the less speed,' and the operator governs himself accordingly. If he stops to take in water, for example, he opens his throttle very slowly when he starts off, and not until he has been running for several minutes does he attempt to let out.

"The reason for this is very simple. Water always remains in the steam pipes, and in the engine itself from the condensed steam of the previous run. This water must be got rid of first, and the cylinders, etc., warmed up before the engine is capable of doing its full amount of work."

Turn to Ireland for Course.



Serious consideration is being given to the proposal to run the 1903 Bennett Cup race in Ireland. A committee of the Automobile Club of Great Britain has gone to Ireland to look over the ground and inspect the roads. Its report is awaited with great interest, as there is no longer any hope that it will be possible to hold the race in England.

At a recent meeting of the club letters were considered from the Scottish Automobile Club, the chairman of the Manchester Automobile Club and the secretary of the Irish Automobile Club, dealing with the feasibility of holding next year's race for the cup in Scotland, the Isle of Man and Ireland respectively.

Details of Detroit Igniter.

It is claimed for the Detroit Igniter, manufactured by the Detroit Motor Works, Detroit, Mich., that it can be put on any engine of one or more cylinders by the user of the engine.

With the igniter one can readily shift the commutator handle for late ignition to start the engine, and, after engine is started, place

the lever so as to secure any point of ignition desired.

As the moving parts of the igniter are on the inside of the cylinder, there is nothing to become gummed up and stick. The sparking plug screws through the cylinder wall into the combustion space, so that it can be removed in a moment's time, if necessary to inspect or clean. The spark jumps between the intervening points at the end of the plug, these points being about 1-32 inch apart, the spark taking place when the brushes come in contact with the copper strip in the commutator roll.

The vibrator on the spark coil should be adjusted so that the greatest efficiency is shown by sparks thrown from end of wire to end of spark plug when the wire is disconnected and commutator brushes are on copper strip. By using the secondary winding in the spark coil (which causes the jump spark), and by the manner of connection a better spark is obtained than with any other igniter, as the voltage is much higher and less battery force is used. This igniter is very frequently run with only two dry cells.

When an Engine Stops.

When an engine stops work, and the owner diagnoses, or believes he diagnoses, the reason, it is well to test that diagnosis first before going on to anything else, for if, say, he cleans and tests his sparking plugs, inspects and tests the valves, agitates the carburetter, varies air feed and fills up the petrol tank all before he restarts the engine, he is then quite innocent of the real stopping reason and has not advanced in knowledge. Whereas, if the inducements to restart are tested one by one, he discovers what was really the cause of failure and is far more likely to recognize it at once should it exercise its baleful influence at any future time.

Freeing the Piston Rings.

After returning from a run and putting up a car a little gasolene should be injected into each cylinder of the engine, and the crank shaft revolved half a dozen times or so. This frees the piston rings from any oil which might glue them up when left for a day or two, and greatly facilitates the starting of the engine when the car is next taken out.

INDUSTRIAL SITES IN TEN STATES.

Address GEORGE C. POWER
Industrial Commissioner Illinois Central Railroad.
Room 306 Central Station, Chicago, Ill.

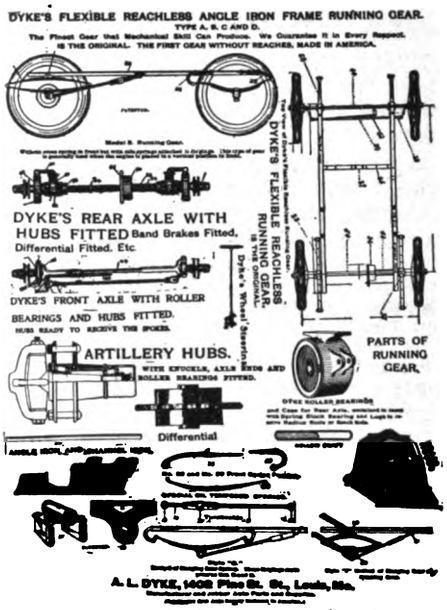
Springfield, Ohio, assignor of one-half to Paul A. Staley, Springfield, Ohio. Filed April 21, 1902. Serial No. 103,924. (No model.)

Claim—1. The combination of a body, a motor and driving shaft mounted on said body, an axle, rigidly connected corner pieces journalled on said axle, a frame rigidly connected to said corner pieces, said shaft being flexibly extended and journalled on said frame, and supporting springs for said body rigidly attached to said corner pieces, whereby said frame and shaft are elastically held in position under the vibration of the machine, substantially as specified.

713,351. Pneumatic Tire. Charles H. Shepard, North Plainfield, N. J. Filed November 1, 1900. Serial No. 35,144. (No model.)

Claim—1. A pneumatic tire having a metallic armor plate embedded in the tread surface thereof, said plate having laterally projecting tongues arranged in staggered relation on opposite sides thereof formed by lateral incisions in the plate, the incisions on one side lying opposite the spaces between the incisions on the opposite side, and those on both sides terminating short of the medial line of said plate, as and for the purpose set forth.

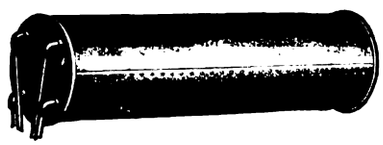
713,366. Internal Combustion Engine. Henning F. Wallmann, Chicago, Ill., assignor to the Wallmann Engine Co., a Corporation of Illinois. Filed February 3, 1900. Serial No. 3,842. (No model.)



Claim—1. In an internal combustion engine, the combination with a combustion cylinder, of means for supplying a body of compressed air thereto for the combustion of the fuel, means for subsequently injecting a charge of fuel at a higher pressure into said body of compressed air and for firing the mixture, and means for introducing into the hot expanding products of combustion in the combustion cylinder another body of compressed air commingled with a spray of water or steam, substantially as described.

713,367. Internal Combustion Engine. Henning F. Wallmann, Chicago, Ill., assignor to the Wallmann Engine Co., a Corporation of Illinois. Filed March 21, 1900. Serial No. 9,530. (No model.)

Claim—1. In an oil engine, the combination with a combustion cylinder having an air inlet valve, a fuel inlet valve and an exhaust valve, all located in the head of the cylinder of an air compressor which delivers compressed air to the combustion cylinder past said air inlet valve, the initial portion of said compressed air serving as a scavenging blast and the remainder forming part of the next combustible charge, a second air compressor whose delivery is connected to the casing of the fuel inlet valve, and a fuel pump whose delivery pipe taps the air duct between the discharge port of said second air compressor and the casing of the fuel inlet valve, substantially as set forth.



713,536. Exhaust Pipe Muffler for Gas or Other Engines. John L. Tobias and Charles J. Tobias, Chicago, Ill. Filed October 11, 1901. Serial No. 78,353. (No model.)

Claim—1. In a muffler for gas and other engines, the combination of a shell provided with a series of small apertures grouped on one side of the cylindrical wall thereof and extending from one end toward the other end, a bushing in one end wall of the shell, such bushing provided with a shoulder abutting against the end wall, a pipe secured in the bushing, such pipe extending through the other end of the shell and a cap inclosing such pipe, such pipe and cap provided with corresponding screw threads to force the end of the cap against the end of the shell adjacent thereto, and such pipe provided with a series of small apertures grouped on one side thereof and extending from near one end thereof; substantially as described.

FOR SALE—An Electric and Steam Automobile, nearly new; will sell at a bargain. Address F. E. BAILEY & CO., Manheim, Pa.

INFORMATION WANTED

We want to learn all we can about the horseless carriages which were made in this country from eight to twenty five years ago. These old automobiles, even though they may have been in advance of the times, are legitimate parts of the history of the development of the automobile in the United States, and many of them, we believe, embodied characteristics of construction now in use, for which some one other than the true inventor is receiving credit. Address,

The WHITE Steam Carriage

AN AUTOMOBILE THOROUGHBRED.

In the 500-mile Reliability Contest from New York to Boston and return, arranged by the Automobile Club of America, three **WHITE STEAM STANHOPES** covered the distance without stop or trouble of any kind—a perfect performance.

The White Steam Generator is absolutely non-explosive, gives pressure in five minutes from cold water, and once in motion is self-regulating. In touring, the **WHITE** will make 100 miles without adding a drop of water or fuel to the original supply.

Write for full particulars, including Prof. Thurston's report on our steam generator, and the official reports of important endurance contests.

Gentlemen:—With regard to advertising in THE MOTOR WORLD, would say that the strongest endorsement any advertiser can give a medium is by continuing to use its columns.

We were among the very first advertisers in THE MOTOR WORLD when it was started. We believe at that time there were not more than half a dozen others at the outside.

We have continued with the paper regularly ever since, and so long as the paper remains as at present, we undoubtedly will continue to be in it.

We advertise in the WORLD because we know that it appeals to a certain class of the automobile industry that none of the other trade papers do, as well as covering the entire field, of course.

Yours truly, WESTON-MOTT COMPANY,

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.

Volume V. New York, U. S. A., Thursday, November 27, 1902. No. 9

FOR BUSINESS VEHICLES

A. C. A. Committee Decides to Hold Such a Contest Next Spring—Interest Already Alive.

The Automobile Club of America will promote a business vehicle contest next spring. That step has been decided upon. The execution of the plan will be left to the new contest committee, and neither time nor money will be spared to make the event an unequivocal success.

At the first of the season's Tuesday night talks of the A. C. A., George F. Chamberlin, a member of the old contest committee, made a suggestion that the club father such an event. With the object of seeing what consideration had been given to the matter a Motor World representative saw Mr. Chamberlin at his office on Monday and asked him the direct question.

"The suggestion has been received with favor," he said. "Indeed, I may add that it has been definitely decided to hold a contest for business vehicles. No formal steps have been taken in the matter, it being the purpose to leave it entirely in the hands of the new contest committee, which will be appointed by the board of governors at its meeting to-morrow afternoon.

"But the matter has been talked over informally in the board, and it is a certainty that the contest will be held. It is felt that the time is ripe for such an event, and that the club is the one to take the initiative. It will give liberally of its means to make the contest a success. Nothing will be left undone to accomplish this end.

"Already letters bearing on the subject and asking us to push such a project through have been received. About half a dozen firms—one of them English—have written us to this effect."

On Tuesday the board of governors appointed John A. Hill chairman of the contest committee, and gave him the privilege of selecting his colleagues. The old committee consisted of Chairman W. E. Scarritt and Messrs. George F. Chamberlin and John A. Hill.

Mobiles at $550.

Ever since E. B. Gallaher assumed the management of the Mobile Co. of America reports have been current that the much-mooted "$500 automobile" would be forthcoming from that factory. Early this week the reports took tangible form, the Mobile Co. formally announcing not exactly a $500 car but one at $550. In general design this runabout does not differ from previous Mobiles, its specifications being as follows:

Running gear, 16 and 14-gauge seamless steel tubing; wheels, wire suspension type, 28 inches in diameter; tires, Hartford Pneumatic, 2½ inches; seat, spindle back; width of seat, 37½ inches; seating capacity, two persons; water tank, 22½ gallons; gasoline tank, 6½ gallons; tread, 50 inches; wheel base, 58 inches; total length, 7 feet 3½ inches; total width, 4 feet 11 inches; total height, 5 feet 5 inches; steam air pump; mechanical cylinder oil pump; low water alarm; double-acting brake.

Of the car the Mobile people themselves say: "The runabout which we are offering is in several ways superior to the cars we sold last year at $750. It could not be better built if we charged $5,000 instead of $550.

The same announcement heralds a reduction of the price of the Mobile delivery wagon to $1,085.

Duryeas East and West.

Papers for the incorporation of the Waterloo Motor Carriage Co., of Waterloo, Ia., are about to be drawn up. The concern will have a capital of $150,000, full paid, and will manufacture cars designed by Charles E. Duryea, which will be practically identical with those of the Duryea Power Co. Mr. Duryea will divide his time between Waterloo and Reading, Pa. There is no truth in the report that the Reading concern will be removed to Waterloo. The two companies are entirely separate.

Bids Opened for Factory.

Bids were opened last week for the erection of the new factory of the Sandusky (O.) Automobile Mfg. Co., and the contract awarded. The work will be pushed vigorously, and the building is expected to be ready for occupancy next spring.

REMINGTON IN TROUBLE

Court Asked to Adjudge Utica Concern a Bankrupt—Steps Taken to Straighten Affairs.

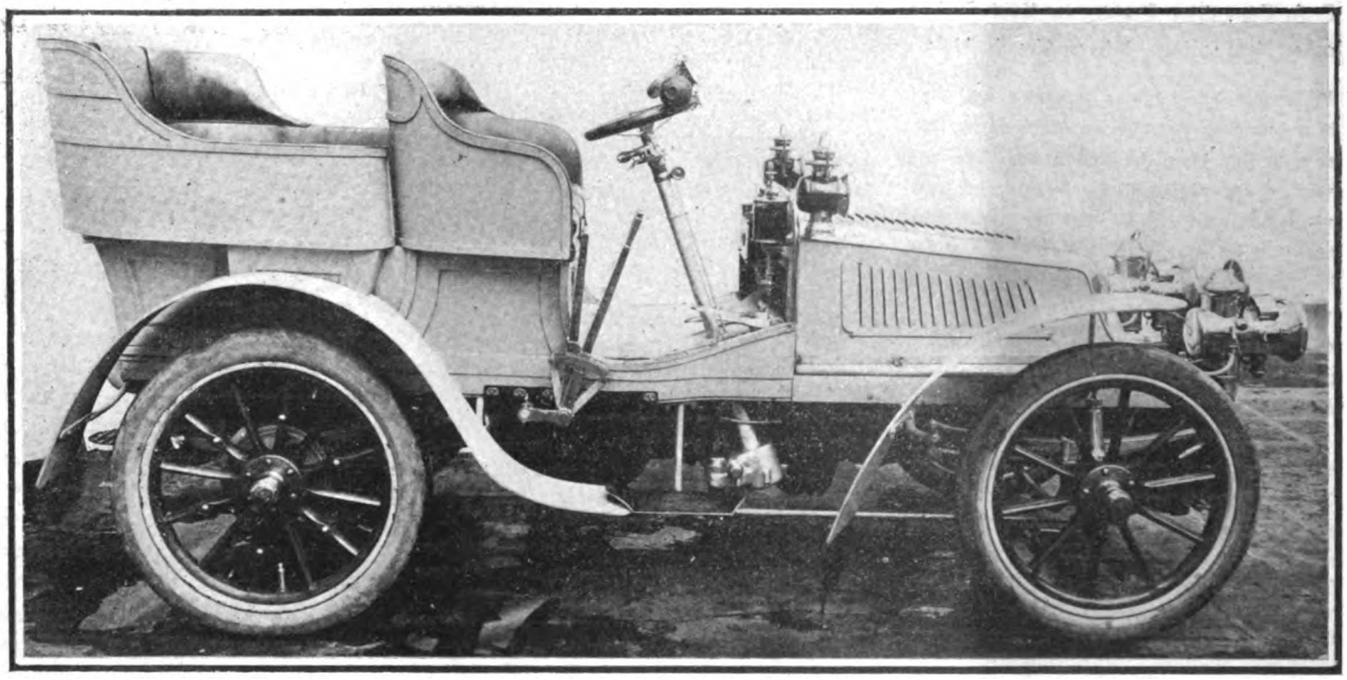
Proceedings in involuntary bankruptcy were commenced last week against the Remington Automobile and Motor Co., Utica, N. Y.

The proceedings were instituted by George E. Dennison as attorney for three creditors, whose claims are stated to aggregate $500 in excess of securities held by them. The largest creditor is the Utica Steam Engine and Boiler Works, with a claim for $600. The other creditors are William C. McAdam, for $25, and William J. Sullivan, for $58.29. They allege that the company is insolvent and unable to pay its bills, and that it committed an act of bankruptcy on November 13 in allowing certain creditors to obtain judgments and secure executions under which certain property of the company was ordered sold.

A meeting of a number of those interested in the concern was held at Utica just previous to the institution of the bankruptcy proceedings, at which the affairs of the company were gone over. Those present professed absolute faith not only in the excellence of the motor but as well of the success of the enterprise with proper capital and management. A committee was named to give the matter attention at once and endeavor to straighten out matters so that manufacturing can go on again soon under better conditions than ever before. The committee consists of Messrs. Wild, Foster, Munson, Dana, Graham and Baechle.

Will Attend Paris Show.

F. A. La Roche, of the American Darracq Automobile Co., and E. T. Kimball, of the Central Automobile Storage Co., are two of the few American tradespeople who will attend the Paris show. The former sails this week; the latter left on Saturday last.



Digitized by Google

EUROPE'S NEWEST CAR

It's a Belgian Production and Incorporates Several Innovations—What They are.

French Bureau Motor World,
2 Rue d'Abbeville.

Paris, Nov. 14.—The Fabrique Nationale d'Armes de Guerre, of Herstal-lez-Liege, Belgium, is one of the most enterprising firms when it comes to making use of their huge plant to produce something for which the demand is of a less intermittent character than small arms. They have created a special automobile department and have carefully studied the progress of motor vehicle construction, with the result that after turning out several experimental types of cars during the past two or three years they are now putting on the market a light carriage which presents some extremely interesting features.

The new F. N. car here shown is propelled by a sixteen nominal horse power engine of the four cylinder vertical type. One of its special features is that it is probably the slowest engine fitted to a vehicle of this class. Running normally at 650 revolutions, the makers naturally claim that it is much more durable than the high speed motors running at double this rate, but though theoretically this may be true, knowledge of the durability of engines is so vague that it is difficult to say whether with the perfect systems of balancing and lubrication now employed the advantage is so great as it ought to be. In any event the Fabrique Nationale has secured this result without any considerable increase in weight, and there can be no doubt as to its being a very quiet running engine. Under the circumstances, therefore, the makers can very well claim that in their case the relatively slow moving engine has a decided superiority. The motor itself is of extremely simple construction, with every part inclosed in accordance with modern practice, even to the exhaust valve cams. Lubricating oil is conveyed by separate pipes to the different working parts, and as just sufficient oil is supplied where needed there is no waste. On inspecting the car after a whole day's run we were particularly struck by the cleanliness of the engine.

The motor is regulated for its normal power of 16 horsepower at 650 revolutions by the carburetter which has a tubular extension something like the Mercedes. A plunger valve covers and uncovers the ports leading to the induction pipe by means of a long lever passing across in front of the engine. This lever is actuated by a small rod, one end of which engages in a grooved collar on the half time shaft and is moved backward and forward by the governor, simultaneously, of course, with the exhaust cams. When the engine has a tendency to race under a light load the collar moves forward and causes the lever to partly close the admission ports of the tubular regulator. The merit of the system is its extreme suceptibility and absolute certainty of action. To increase the speed the ports are held open by a pedal worked lever, when the engine will develop up to twenty horsepower.

Another interesting feature about the F. N. car is the change speed gear. The principle of it is not new, as something like it is seen in the Renault vehicle, but the application is decidedly ingenious. It is arranged for three forward speeds with direct drive on the top speed. It is composed of two triangular pieces known as a "cavalier," and they swing to the right and left on a shaft at the apices. At each of the bottom angles they are connected by shafts carrying wheels for the first and second speeds, and the triangular pieces are cut away between these shafts for the passage of the motor shaft. By moving the cavalier one way or the other either the first or second speed wheels are put in gear with the wheels on the motor shaft, and when the triangular pieces are moved to a vertical position, so that neither of the side wheels are in mesh, the drive is direct through the central shaft. The gear is very small and compact and of course runs in an oil bath. Power is transmitted by a shaft to the differential in which the usual cardan joint is replaced by an expanding joint which it is claimed is stronger and more efficient. The shaft is, moreover, carried in a sleeve extending from the differential box. The method of suspending the rear springs on collars to take in stresses due to the movements of the carriage body off the frame is interesting, and there are in fact many devices in the F. N. car which repay a close investigation.

To say that the forthcoming show in Paris will prove more interesting than its predecessors is to give expression to a stereotyped phrase which is nevertheless perfectly true in view of the great advance that continues to be made in automobile construction. Its importance will be greatly increased by the fact that several foreign makers will be exhibiting. Two English firms at least will be showing vehicles, the Napier and the Wolseley, and the well known makers, Fiat, of Turin, will also have a stand.

Unfortunately, the new Mercedes cars will not be seen in Paris next month. This is a pity, as the vehicles are said to be extremely interesting, especially in the way of weight reduction, which has enabled the Cannstatt people to build much more powerful cars within the 2,200 pounds limit. They have given up the armored wood frame and are building them of U section steel in one piece. The results are said to be surprising. The new Mercedes will not be seen until the Nice meeting in March next.

ALCOHOL AND RECORDS

Both Matters of Moment in Paris—Why American Makers Should not Overlook Alcohol.

Paris, Nov. 14.—In connection with the Paris show also there is to be a conference on alcohol, which question continues to occupy a great deal of attention in official circles in France and Germany. Alcohol is a "national product," the use of which the governments are trying to enforce to the exclusion of gasolene, but there are many things to be done before its objections can be overcome.

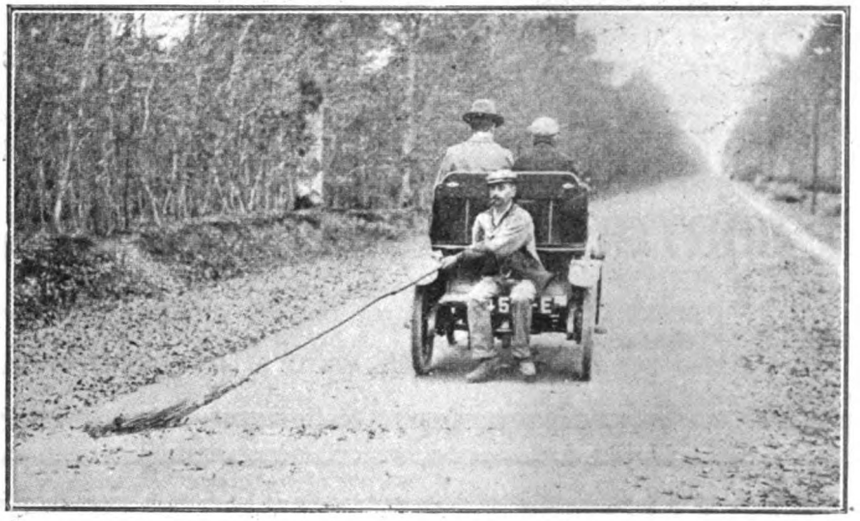
The chemical drawbacks have first to be tackled in the way of denaturising it and rendering it unfit for human consumption without impairing its efficiency as a fuel, and this is a matter which has hitherto proved an almost insuperable problem for chemists. There is a big prize outstanding for the man who can discover an ingredient which will denaturise alcohol without reducing its calorific power, or causing trouble through the burning of a non-volatile product in the motors, and the inventor of a satisfactory system would find an easy way to build up a big fortune.

Once this difficulty has been overcome, the governments will be confronted with another in the question of price. Unless alcohol can be bought more cheaply than gasolene its future is of course hopeless. In Germany we believe this can be done, but in France the state derives such a huge amount of its revenue from alcohol that it will find it very awkward to reduce the heavy taxation on this spirit, and the only alternative is to put almost prohibitive duties on imported petroleum. No doubt, in course of time, a way will be found of giving a preference to alcohol, though whether by reducing the price of this spirit or increasing the cost of gasolene it is impossible to say. In the latter case it would be a very poor lookout for automobilists.

This is undoubtedly a great question which, when it is solved, will have vast consequences on trade, for it is to be remarked that there are few countries where gasolene can be procured at a reasonably low figure, and if alcohol can successfully replace it, as it already does to a certain extent, an enormous stimulus will be given to the trade in alcohol automobiles in other parts of the world where gasolene is either too expensive or its use is attendant with too many risks.

In India, Africa and other tropical countries the employment of gasolene is out of the question, and now we find Peru trying to find an outlet for its home grown alcohol. Even a country like the United States, which produces petroleum, cannot afford to neglect the alcohol problem in view of the great importance it will have at some time or another upon the foreign trade.

The fall of the year is invariably accompanied with a fall of records, and during the past week the new official course at Dourdan has been the scene of many a remarkable performance. Fournier's exploit over the mile, recounted last week, has been eclipsed by Augières, who drove a Mors of exactly the same type. He reduced the time for the mile to 46 seconds, but he failed to get the kilometre, which still remains to the credit of Fournier. Thellier, on a Passy-Thellier voiturette, annexed the two records for this class of vehicle by covering the mile in 58 seconds and the kilometre in 36 1-5 seconds, and the light carriage records have been secured by Théry on a Decauville, who rode the mile in 48 2-5 seconds and the kilometre in 30 seconds. Other records were as follows: Derny, on a two-cylinder Clément bicycle, kilometre, 39 4-5 seconds and mile, 1:5 2-5; Derny (four-cylinder Clément bicycle), kilometre, 33 1-5 and mile, 53 2-5; Truffault (Truffault voiturette), mile, 40 1-5 seconds; Osmont (De Dion tricycle), kilometre, 33 seconds; Rigal (Buchet tricycle), kilometre, 33 and mile 53 3-5; Oury (Clément voiturette), mile, 1:1 4-5. Several other attempts are to be made while the fine weather lasts, including one by an English car, the Wolseley, to be driven by C. Jarrott.



The sporting committee of the A. C. F. are still examining the different electrical timing devices which have been submitted to them, and it is expected that very shortly they will be able to lay down an installation at Dourdan, when, if successful, the human timekeeper will be entirely dispensed with for clocking vehicles over short distances.

The persecution of automobilists for alleged furious driving is bringing joy to the heart of the horse dealer. We clip the following advertisement of a member of this fraternity from one of the leading Paris journals:

"Doctors, stockbrokers and business men: Don't buy automobiles, which are not allowed to travel at more than twelve kilometres an hour in towns. Buy good trotters, which will do the kilometre in two minutes. No limit can be put upon the speed of animal traction."

Therefore, the horse dealers confess that their horses can travel nearly twice as fast as the limit fixed for motor cars. This is a matter upon which the police have always displayed an exaggerated scepticism. They are merely courting accidents by compelling automobilists to travel slower than horses, and it is simply monstrous that the lives of the public should be placed in constant peril through unmanageable horses being driven at the rate of eighteen and a half miles an hour.

THE STRAIGHTAWAY COURSE AT DOURDIN, FRANCE.

SWEEPING THE ROAD FOR A RECORD TRIAL.

French Government Forbids Further Trials.

An interdict has been laid by the French Government on automobile speeding on the Dourdin course, over which the mile and kilometer records were recently broken.

This action on the part of the government has aroused considerable local indignation, as the road is practically unused by ordinary traffic, and the automobile trials had attracted many visitors and greatly increased the trade of the locality.

It is now proposed to lay out a private road, four kilometers long, parallel to the Dourdin road, on the property of the Duchesse d'Uzes.

Bishops to Tour Abroad.

Few Americans tour more enthusiastically and persistently than do Mr. and Mrs. Courtland F. Bishop. During the summer and fall they travelled several thousand miles in their Mercedes car in New England and New York State. They now contemplate a more ambitious flight. They will go to Paris in December, where a new car is being built for Mr. Bishop. After making a run through Southern France they will sail for Algiers, and will spend the winter touring.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y, Post Office, November, 1900.

NEW YORK, NOVEMBER 27, 1902.

Fostering the Commercial Vehicle.

About a year since we quoted a Western automobilist who narrated how more than a decade ago he had driven a steam threshing machine up and down the hills of his native State, and who, remarking the diffidence of automobile manufacturers in approaching or embracing the self-propelled traffic vehicle, suggested that they might study the steam thresher to their advantage.

It is good news, therefore, that the Contest Committee of the Automobile Club of America is practically of one mind that a contest of business vehicles, as was urged by the Motor World last week, shall form a part of their next year's programme. It may induce automobile makers to "go to the thresher," or will, at least, turn their thoughts and ingenuity in the direction that promises the greatest returns and probably quicken the transferral of blue prints into vehicles.

The trade's attitude toward the subject has long been peculiar. While admitting almost to a man that the future of the industry is bound up in the traffic vehicle and while as conversant with the fact that every man in business, of whatever nature, awaits and holds a warm welcome for the vehicle that will replace and reduce the cost of animal transportation, the automobile trade is as shy as a kittenish girl of grasping the actual manufacture of such vehicles. Generally speaking, what are termed delivery wagons is as far as any of them have ventured and these differ from their pleasure cars mainly or only in body design.

It is high time, therefore, that an effort was made to overcome this timidity and to develop and guide the trade in the direction which it itself admits it should go, but does not go. Public contests, such as the Automobile Club has in view, make for that end and are therefore to be encouraged and applauded.

Lack of Closed Cars.

Although another winter is at hand, if electrics be excepted we are yet without a closed car. The indifference of manufacturers of steam and gasoline vehicles in this regard is almost inexplicable.

Fur and leather but partly serve to keep out the cold; their effect is minimized by chilling rain and accumulated snow, such as are to be expected of the months ahead.

If the motor car is to become an all the year 'round vehicle and not merely a fair weather conveyance, it is time designers turned their wits toward the production of substantial and adequate protection from the elements, of which the penetrating north wind is but one.

The closed car affords practically unlimited scope for originality and invention.

Abate the Nuisance!

One of the most, if not the most offensive, nuisances attendant on automobile shows is the promiscuous and senseless tooting of horns and clanging of bells that have marked the exhibitions of the past.

The practice is not only offensive to the ear and to good manners, but it has added not only the difficulty of conversation but to the conduct of business.

To the testing of a horn or a bell when the sale of either is involved, no criticism can attach, but it is notorious that most of the noise is wanton noise made for the mere sake of noise and that stand attendants contribute as much, if not more, to the nuisance, than the small boy to whom a surreptitious squeezing of a bulb is keen delight.

The suggestion that the nuisance be abated comes to us from one who has exhibited at all previous shows and who expects to exhibit at all future ones; he is not a man whose nerves are "on edge," but he maintains that the indiscriminate noise has interfered with the transaction of his business and his protest is even more emphatic than we can well put in print.

We believe that most exhibitors will agree with him, and if the show management cannot or will not do anything to abate the evil, they could help matters by at least tacit agreement to keep horns and bells out of sight or reach of spectators and by letting fall a few words in the ears of those attendant on their respective exhibits.

How Damage is Done.

Frequent and violent changes of speed are not only unnecessary in many cases, but they impose strains on the entire car that are highly injurious.

If a driver will but stop to think of what takes place when he changes suddenly from his first to his third speed, for example, he will be apt to take pause. Gear wheels mounted on rapidly revolving shafts are separated and others violently brought into mesh. One moment the engine is racing, the shafts and gears revolving with greatly accelerated speed; the next the gears engage, and through the transmission gear the engine is burdened with the load of the entire car and called upon to take up its propulsion at a speed considerably greater than that at which it was going before the change was made.

It is a wonder that the gear wheel teeth do not break off, either before they come fully into mesh or afterward. This peril avoided, the transmission gear feels the shock, and through its long length of shafting, bevel gears and chains it is transferred to the rear wheels, fortunate if it is done without breakage.

No one ever saw a locomotive engineer attempt to start a heavy train at full speed. He opens the throttle little by little, easing up as the pull comes through the couplings and the cars, and only applying full power when the train gets well under way. If he took any other course the couplings, being the weakest link in the chain of parts, would break incontinently, and the fat be in the fire.

None except the most careless or incon-

Digitized by Google

siderate operators throw in the clutch and start a car on the high speed suddenly from a standstill. Unless the clutch slipped sufficiently to ease matters something would almost certainly break if they did. In the case of the speed change there could be no such easing. It is metal against metal, and a row of stripped teeth will often register their protest against such treatment.

Of course, an operator learns the knack of making speed changes. He becomes able to "feel" the engaging of the teeth, and to know when they get into mesh smoothly and safely, just as, on the other hand, he intuitively feels the first warnings of anything wrong when making the change. With this knowledge he is able to steer clear of the pitfalls of broken teeth and strained engine and transmission parts.

Ignorance or Bias.

It is a little surprising that the Autocar, in commenting on the reliability contest, should fall into such gross blunders as are revealed in one of its articles.

"A bad defect in the rules, from a reliability point of view, was that any time lost in penalized stops would be counted in the running time," its says. "Thus a car with any speed about it could afford to lose anything up to half its time limit in such stops, and yet arrive at the end of its stage with a clean sheet, so far as obtaining a first-class certificate was concerned. The rule was unquestionably a foolish one, as, from the detailed reports, it seems that nearly every vehicle gave more or less trouble, yet there are about a dozen claimants for the president's cup for having made 'perfect runs.'"

Such egregious errors as are contained in these remarks are attributable either to ignorance or to bias. It is not easy to say which is the more discreditable. If we take ignorance to be the correct solution, which is the more charitable one, we are compelled to admit that more than the usual British denseness is back of it.

If there was one thing emphasized more than another in the contest referred to it was the fact that time lost between the controls was time lost "for keeps." A single penalized stop, even if it were of but a second's duration, destroyed a car's chances to obtain the president's cup. There was no making this up. Five and one-half days of perfect running could not blot out one little slip, nor could any amount of speeding expunge from the record one single falter.

Equally plain was it that the seventeen cars qualifying for the president's cup had really made perfect scores. If "nearly every vehicle" had given "more or less trouble," as the Autocar claims, they could not have made flawless runs nor be numbered among the elect.

Such articles as this only lend color to the belief that our English cousins wilfully close their eyes to the good there is in other countries.

Playing it "Low Down."

The eminently respectable gentlemen who constitute the Long Island "Protective" Association may feel proud of their "good work," but most men will agree that it is "playing it low down" to enforce the four-miles-on-bridges law against a physician bent on saving human life.

The association's hired men—the clam diggers and pickle canners who constitute its "expert" law enforcers—are scarcely to blame. They must make arrests to hold their jobs, and everything not drawn by a horse looks alike to them. It is their respectable employers who are responsible for the jug-handled justice and oppression that maintains and that could not exist did the automobile interests have a defensive organization worthy of the name.

Universal enforcement of the act governing speed on bridges can make the law so odious that "hayseeeds" and "protectors" alike will squeal until their cries reach heaven and the legislature.

Incidentally, the arrest of the Long Island physician suggests how much luckier than a private patient is the unfortunate for whom a public ambulance is called. The ambulance by clanging its gong obtains a clear course and without limit of speeed. But no matter how urgent the call, a physician in his own conveyance must crawl at the legal pace or risk arrest.

Vehicles of Happy Mean.

Automatic devices possess advantages, of course, but they bring with them added responsibilities, greater complexity and, frequently, increased cost. And simplicity is a factor of very considerable importance, as is generally recognized.

As time goes on, and the motor vehicle industry becomes more and more settled, this striving after simplicity will become still more marked. When automobiles are new, and the enthusiasm of their users runs high, it does not make so much difference. Sometimes complexity even commends itself. There is a pleasure in learning the functions of a multiplicity of levers, valves and other parts, and in gratifying it there is much enjoyment to be had. But in the end the feeling is certain to be all the other way.

Even now there is much complaint—largely from the uninitiated, to be sure—of the formidable appearance of the modern car, of the mass of "machinery" it carries, and of the time required to learn to operate it and the skill that is a prime requisite of the expert. That feeling will grow and culminate in a demand for the brushing away of all save the absolutely necessary features of the automobile.

What the motor vehicle user of half a dozen or a dozen years hence will demand is a car with the simplest possible method of control, and as near "fool proof" as anything wrought by human hands can be.

With all this it must be borne in mind that the personal equation is still a very important one. The operator of the vehicle must do his share of the work, else not even the most complacent of engines will be able to deliver it full quota of efficiency.

Consequently, the vehicle that strikes the happy mean, giving the most simple control while at the same time avoiding automatic devices that are likely to get out of order in the hands of careless or incompetent operators, is the one that will most completely fill the bill.

Kelloggism Outdone.

After all, Judge William C. Kellogg, of Yonkers, is not the "whole thing." It will probably pain him to read this from Motoring, of London, about a rival of his in Yorkshire:

"The motor car, which was timed by the policeman, contained four passengers, who all swore that it was proceeding at less than the legal limit.

"They were persons, however, who were not entitled to credence in Yorkshire. One was a mere duke, the second an ordinary bishop, the third an unimportant member of Parliament, and the fourth a Cabinet minister of no particular prominence.

"The policeman, Giles Blunderer, swore that the car was whirling along at a speed of at least forty miles an hour, and the driver was fined £50, with costs of £68.

"The duke, the bishop, the member of Parliament and the Cabinet minister hurried out of Yorkshire before any one could arrest them for perjury."

Commentary

When the journalistic creator of the "bicycle face" to keep up with the times announced himself as the discoverer of the automobile face, I was not surprised, nor was I pleased, neither of which failures on my part probably ever reached the knowledge of the creator and the discoverer above mentioned. Seriously, I didn't believe there was any such thing—that is, I had never noticed any peculiar appearance of the faces of those who indulged in automobiling. But from a dermatological point of view it appears, however, that the "motor face" is now an advertised fact, since in Sunday's paper this ad. appeared:

"Motor Faces.—Keen autumn winds, dust laden and driven sharply against the skin, play havoc with the complexion. No need to forego the pleasures of the automobile. Goosebury has learned the secret of repairing the ravages of modern life. Daily demonstrations of the new (painless) subcutaneous method of building up sunken noses, rounding out the contour of the bust and filling out wrinkles. Bring your own doctor with you!"

Perhaps it is my unfamiliarity with practitioners of dermatology which makes the foregoing seem rather startling, especially that invitation to "bring your own doctor with you." Can it be that this proclaimed curer of motor face by the subcutaneous method is afraid to take the risk himself and wants to make the patient's physician a particeps criminalis, or is the invitation merely intended as a bluff for those whose credulity is not sufficient to cause them to forget that such things as quacks exist and prosper?

* * *

News item. The Sultan of Sulu never allows more than three chauffeurs to accompany him in the royal automobile, 'cause he hasn't any.

* * *

In the magnitude of their wisdom the city fathers of Kansas City, on the Kaw, have decreed, as a means of determining the ownership of each death-dealing automobile in Kansas City, that henceforth no motor vehicle shall be allowed to use the streets of that city which is not "equipped with at least two lamps, upon the front and sides of which numbers at least four inches high must be painted in red." Just imagine an alderman standing in the path of an oncoming Kansas City scorcher, waiting for him to get near enough for the standee to see what those four-inch numerals on his lamp faces were! Imagine, also, the resulting funeral, in which that particular alderman would play the leading part shortly afterward! Kansas City aldermen are worthy of their office, and they will not suffer in comparison with the best of their kind elsewhere; splendid stupidity is the first essential of an alderman, and the determination to allow no chance to prove his possession of it to escape him, is the second. Beyond these two, the mental possessions of no alderman were ever known to go.

* * *

He laughs best at the ills of his fellow motorists who delays his cachinations until he has safely returned his own vehicle to the establishment where it is cared for.

* * *

Paris has a municipal school wherein those who will are taught the intricacies of automobiling. When the students have mastered the subject from A to Z they are given diplomas setting forth that the holders thereof know all there is to know about an automobile. I'd like to bet that every blooming graduate has to take a mighty thorough postgraduate course in the College of Experience, however, before that Paris diploma of his actually does show he is capable of meeting one-half the requirements of the case.

* * *

When the man in search of a perfect motor attains his ideal, he at once discards it and gets another. Why? Don't know; ask him.

* * *

So we are really going to have a try at that steel road, eh? Well, as every one else seems so much in favor of the idea, I suppose it is up to me to file an objection. From almost the beginning it has been the custom of the motorphobes to characterize an automobile as a locomotive; in fact, the legal title of an automobile in Great Britain is, I believe, "a light road locomotive;" so now, when it comes to running motor vehicles on steel rails their likeness to a locomotive will be almost perfect. Then look out for a new outburst of what the yellows call "popular indignation." These road rails are to be of iron, as I understand it, and if my memory of the old-time iron rail such as the railroads were equipped with before the steel rail came is correct, one of the favorite tricks of an iron rail under usage is to develop into a sort of metal porcupine through the slivers it throws out. Imagine a set of $300 pneumatic tires coming in violent contact with a well splintered iron rail! Then imagine the joy of the nearest repair man and the unholy glee of the not-too-far-distant tire maker. You will not have to imagine what the language or the feelings of the owner will be. You know; so do I.

* * *

When the man who buys a freak vehicle knows he is a fool he knows more than most people give him credit for.

* * *

Wake up an Englishman in the middle of the night and ask him what is the greatest danger his countrymen are subjected to and he will answer you "side-slip." The Lord only knows where and why the Englishman first went daffy on side slip, but certain it is that he is, and for many years has been, an incurable monomaniac upon side slipperyness. According to a universal belief among all Englishmen no one can at any time, or in any conveyance from a wheelbarrow to a four-in-hand, venture upon any street, alley or road anywhere within the confines of the United Kingdom without being in mortal danger from side-slip. What side-slip will not do to the traveler upon any kind of an English road has yet to be thought of; war and pestilence are as the gentle dews from heaven when compared with the deadly side-slip. So it comes as a matter of course that Alfred Harmsworth, the millionaire publisher and owner of a score of motor vehicles, should have felt it obligatory upon him to demand of the Automobile Club of Great Britain that it at once appoint a committee to consider the deadly side slip and to plan for its annihilation. Mr. Harmsworth, like the true Briton that he is, announces that he considers "side slip the one drawback to motoring." To Americans the whole thing seems very closely akin to a tempest in a teapot, but, then, we always were a reckless, thoughtless people, not at all like our careful, deep thinking English cousins, don't you know?

* * *

Advice as to which is the best vehicle, form of power, motor and so forth, can usually be had for nothing, and is often worth less.

* * *

Perhaps it may be the price of coal, or it may be the modesty of the steam heat which my landlord is now supplying me for alleged heating purposes, but whatever it is, I have of late found myself studying very closely the needs and methods of keeping warm. In the course of these studies I have noted that no matter how perfectly equipped the average automobile is in other respects, there is an utter absence of any sort of protection for the driver, which must make rushing through the chill November air at better than a twenty-five-miles-an-hour gait anything but an unalloyed delight. While I can see the danger of using something of a lap-robe order, yet I cannot understand why some such arrangement as the folding doors the hansom cabs have could not be employed to protect the driver from the cold. While perhaps Serpollet's famous Easter Egg was a bit too much in the direction of a covered body, yet it certainly demonstrated that it is quite possible to protect the lower half of the driver's body so as to add not only to his comfort, but to the vehicle's speed and to the cleanliness of both. As it is now, the automobilist as he rushes along unprotected from the biting blast is by no means a thing to be envied; at any rate, if appearances are to be relied upon, he isn't.

* * *

Some men are born to be great in automobiling, some achieve greatness therein and some thrust themselves upon it. It takes all that two-thirds can do, however, to overcome the ill effects of what the remaining one-third does not do.

* * *

A true philosopher never wastes any time arguing the merits of the particular vehicle he favors. He mentally concludes his opponent is a fool and lets it go at that.

READY FOR EAGLE ROCK

Rain or Shine, the Climb Will Occur Today—The Entries—Hill is a Famous "Rise."

Everything is in readiness for the contest on Eagle Rock Hill, promoted by the Automobile Club of New Jersey and set to be run this (Thursday) morning. Given good weather, it will undoubtedly be a bigger success than the event of last year. The entry list is a notable one, and great sport is certain to result.

In the endeavor to make of its annual contest a classic event the Newark Club has much in its favor. Contests of the sort are all too rare. Public and trade alike will welcome more of them, and in the selection of its date and, even more, its venue, the promoting organization has been very happy. With such an energetic chairman as W. J. Stewart to look after it there is scant danger of the event encountering neglect.

Eagle Rock hill is one of the show places of the Oranges. It is the Mecca of pilgrims, who go thither on foot, on bicycles, in carriages, in automobiles and in trolley cars. Close to beautiful and aristocratic Llewellyn Park, behind the portals of which many of the most costly residences of that favored section are to be found, the hill is reached after traversing many of the fine highways which make the Oranges a paradise of good roads. From its summit a magnificent, an unrivalled, view is obtainable. New York, a dozen miles or more away, is plainly visible on a clear day, and in every direction a panorama of surpassing loveliness enchants the onlooker.

The hill itself is about one and a quarter miles long, with a gradient that runs between 12 and 18½ per cent., the average being 14 per cent. A peculiarity of the ascent is its great regularity. For the major portion of the way it never varies, the sharp rises and corresponding decreases in steepness usually found on long hills being conspicuous by their absence. As the top is approached the rise becomes sharper, while the last hundred yards discounts all that has gone before. A couple of turns add to the difficulty of the ascent at this point.

The surface of the road is nearly always

THE LAST AND STEEPEST TURN.
SHOWING THE SNAKELIKE COURSE

NEAR THE SUMMIT.
THE FOOT OF THE HILL.

Digitized by Google

the same—a superfine macadam at all points except the worst rise at the top. There the macadam is loose and rough, and there balks and falters may be looked for, if anywhere. An examination of the hill by the Motor World man a few days ago showed that the usual conditions prevailed this year.

The first contest on the hill was held last election day. W. J. Stewart won in the steam class, making the mile and a quarter in 2 minutes and 42 seconds. In the gasolene class Charles E. Duryea was the winner. His time was 3 minutes 53 seconds. These records are likely to be lowered, as they have been beaten this year in practice.

That the interest in the event has increased greatly is shown by the fact that up to date there are twenty-seven entries, with doubtless a number more to come. Last year there were only thirteen.

As last year, one of the cups offered by the club will be for steam vehicles and the other for gasolene.

That there may be no dispute over times or winners, the club has borrowed from the Automobile Club of America the Mors timing device used by the latter.

For the contest this year the New York and New Jersey Telephone Company has agreed to establish telephone stations at various points on the course, so that the spectators at these points may know just what is going on at the starting and finishing points.

The contest will be held regardless of the weather.

Following is the list of entries: W. J. Stewart, Locomobile; A. P. Smith, Automotor; H. W. Whipple, Packard; R. T. Newton, Locomobile; W. Walter, Walter; I. D. Plank, Oldsmobile; C. E. Duryea, Duryea; C. E. Proctor, Winton; W. J. Stewart, Autocar; Angus Sinclair, Toledo; A. J. Lamme, Long Distance; A. Phelps, Locomobile; Mobile Co. of America, Mobile; Ajax Motor Vehicle Co., Ajax; H. M. Wells, Prescott; L. J. Worth, Oldsmobile; Jonathan Bartley, Stanley; C. Brewster Chapman, Locomobile; C. H. Martin, Stevens-Duryea; Walter Weston, Knoxmobile; G. Paddock, Oldsmobile; R. G. Du Bois, Crestmobile; Prescott Auto Co., Prescott; L. J. Wyckoff, Knoxmobile; R. T. Newton, Autocar, and F. C. Reeve, Oldsmobile; E. A. Fairchild, Knoxmobile; H. C. Cryder, Gasmobile, and H. M. Abdonie, Long Distance.

New York to Boston Without Stop.

Apart from the mere matter of time a Packard car belonging to W. F. Bryant, of Boston, and driven by R. Ross, established a record that is no small plume in the Packard cap—that of completing the 244 miles between New York and Boston without a stop of any kind—or without touching the engine. The elapsed time of the trip was thirteen hours, one hour faster than the trip from Boston down a few days before.

The man with the cheap automobile and the man with no automobile are always sorry for each other.

WILL FIGHT TO A FINISH

So Says Foxhall Keene's Legal Counseller—Grounds Upon Which Appeal Will Be Based.

Steps are being taken to secure a reversal of the sentence against Foxhall P. Keene for illegal speeding, rendered at Oyster Bay, Long Island, last week, as related in these columns. Informal notice of an appeal was lodged with Justice of the Peace Franklin when he imposed a fine of $20 on the accused, and the papers to be laid before the County Court making a formal application are being made out. The grounds for the appeal are that the decision was against the evidence.

"There is not the slightest intention of dropping the matter," said Lawyer Frederick N. Watriss on Tuesday, in reply to the question put by the Motor World man. "On the contrary, we shall fight it to the end.

"Twenty days are allowed us in which to make formal appeal. Within that time the papers will go to the County Court. They will ask that the case be reviewed by the Appellate Division, and the latter will be asked to reverse Justice Franklin's verdict. It may either do this or direct that a new trial be given. The latter is the less probable alternative. If a new trial should be granted, however, it would come before Justice Franklin as before.

"We shall ask for a reversal on the ground that the verdict was against the weight of evidence. The law directs that in a criminal case, as opposed to a civil one, the finding shall be based on evidence that proves the case 'beyond a reasonable doubt.' We shall claim that just the contrary was the case—that evidence was submitted which shook the State's case to its foundations. In spite of that the justice ruled against us.

"There are two grounds upon which we attack the State's evidence. One is the accuracy of the timing. We grant the accuracy of the watches—they were stop watches and have been tested—but we impugn the accuracy of the timers. In pressing this question at the trial we succeeded in confusing the witnesses to such an extent that we are now prepared to also question the assertion that the accused covered a full eighth of a mile in the time stated. Upon these two points, as well as on the proven fact that the car could not run at a speed of more than twenty miles an hour, we shall base our appeal for a reversal."

It will be recalled that Mr. Keene was arrested while driving with Mrs. Keene and a chauffeur in a Renault six horsepower car, on the Jericho pike, charged with having covered one eighth of a mile in 18½ seconds. Evidence was brought to show that the car was so geared and powered that this was an impossibility. The testimony of the professional automobile catchers who made the arrest was believed, however, and the prisoner found guilty.

Scarritt on State Organization.

Having received favorable replies from nearly all the clubs in the State, Secretary Frederick H. Elliott, of the Syracuse Automobile Club, is expected to issue a call this week for a meeting to organize what he terms the "Associated Automobile Clubs of New York." The call will be sent to the officers of every automobile club in the State. It is proposed to maintain permanent headquarters.

As was stated in these columns last week, the principal object of the proposed association is to prevent the passage of unfriendly legislation at Albany this winter. The interests of automobilists in general will also be looked after, of course, but for the present at least the matter of legislation will probably overshadow all others.

As the Syracuse Club is not a member of the American Automobile Association, although it is understood that it will join if the dues of the latter are reduced, the bearing the new association will have on the older and more comprehensive body is naturally an interesting one. With the object of ascertaining how the latter viewed the proposed organization, the Motor World man put the question bluntly to President W. E. Scarritt on Tuesday.

"We have not had any meeting since this matter came up, and consequently cannot be said to view it in any way," was the noncommittal reply.

"The policy of centralization could be carried to almost any length," he went on. "A State association might be able to do good work; so could a city association. But really I have not given the matter any attention.

"Some clubs have shown a disinclination to join the American Automobile Association, apparently actuated by the feeling that the dues were too high. We have called a special meeting for December 9, at which time we will consider a proposition to reduce the dues from $3 to $1 per capita. Judging by the correspondence we have had that step, if taken, should remove the stumbling block.

"It was my idea in the first place to put the dues at $3. I thought the association would need the money. As a matter of fact it has not. I am like that man who said that he was not too proud to admit that he was wrong, consequently I am in favor of cutting the dues down.

"But as to the proposed State association, I prefer not to express an opinion."

The sensational cabled reports of Paris's "automobile police" prove to arise merely from the exploits of one patrolman—Navetat by name—mounted on a motor bicycle. The machine is his personal property, and being a clever machinist he is permitted to use it, the authorities giving him an extra allowance of 10 francs per month for its care and up-keep.

MORGAN'S STEAM TRUCK

Ten ton Vehicle That Bristles With Original Features—May be Used for Many Purposes.

While others are thinking of building business vehicles and acknowledging that in such automobiles much of the industry rests, the Morgan Motor Company, Worcester, Mass., are among the few who have actually got beyond the "thinking" or blue print stages and are about prepared to market them.

A ten-ton steam truck, here illustrated, is one of the Morgan Company's productions and one in which much ingenuity is centered.

The general dimensions of the truck are as follows: Total length 22 feet 5 inches, total width 7 feet. The loading space is 16 feet 10 inches, and has a total loading area of 118 sq. ft.

What may be called the foundation of the truck is formed of two 9 in. I beams. These are tied together with 3 in. I beams for that part of the frame which carries the loading platform, by two 3 in. channels in front of and 7 in. I beams behind the boiler, and also by the boiler suspension, and two 6 in. deck beams over the rear axle. The frame work is of a design sufficiently heavy to withstand the strains to which it may be subjected.

The boiler is of the water tube type, the design being something like that used aboard torpedo boats. The steam drum and the two mud drums are of extra heavy steel tube, and have at each end large hand holes so that the entire boiler may be easily cleaned. These drums are connected by 1 in. seamless drawn steel tubing, the joints being of a special design, which make the replacement of tubes an easy matter. In case a tube gives out, and there are none on hand for repairs, each opening may be effectually closed by the insertion of a flanged plug. There is a dome above the steam drum which thoroughly dries the steam before it is taken to the engine. The whole is encased in a double steel jacket, with a 1 in. lining of fire felt next to the flame, and a 1 in. porous, asbestos lining between the shells. As a point of convenience, it should be noted that by breaking the steam and water connections and removing four bolts, the entire boiler may be lifted bodily from the truck. The outer shell also is arranged with the idea of making access to the boiler as easy as possible. The boilers are given a cold water test of 600 pounds and also a steam test of 300 pounds. The safety valve, which is a locomotive, muffled pop, is set at 225 pounds. The working pressure is 180 pounds. Water is supplied to the boiler by a power pump geared to the engine, the amount being regulated by the usual bi pass.

Either fuel oil or kerosene may be used for generating the steam. The burners, of which there are two, are easy of access, and may be drawn out together by the disconnecting of a single joint. They may be reached either from the front or from the rear. The oil is not carried under pressure in the tanks, but is forced into the burners by a small pump, which is geared to the machine.

The engine is a double, tandem, compound, with the cranks set at 90 degrees. This type is claimed to be superior to that of the cross compound engine ordinarily used on such machines, particularly in that it is at all times possible to start the truck from a stand and without reversing. The crank shaft and the main gear are formed of a single solid piece of steel. The working parts are enclosed in an oil tight case from which the cylinders are separated by an intermediate frame. This renders it easy to change the piston and valve rod packings and also prevents the steam from passing from the cylinders to the crank case and there condensing. By a special throttle it is possible to admit live steam to the low pressure cylinders, thus very near doubling the power of the engine. From the engine the steam passes to a combined feed water heater and separator. The water of condensation is returned to the water tank and whatever steam may be left passes into an exhaust head of special design in the space over the boiler and is burned up.

The oiling of the various parts of the engine and transmission is taken care of by a small, power pump, oil being drawn from the lowest point of the case and carried through small copper tubes to the various bearings. This system of forced lubrication drives a stream of oil constantly about each bearing, preventing hot boxes and reducing the wear to a minimum.

The transmission gear is also entirely enclosed and runs in a bath of oil. Nothing but spur gears are used throughout the truck. Two ratios of gearing are provided; with one the engine makes ten revolutions to one of the driving wheels, and with the other twenty. The slip gears are on an intermediate shaft between the engine and main sprocket shaft, the compensating gear being on the latter. The engine and transmission gears are in a single case, which is suspended at three points. The cylinder end of the engine is connected to the frame by a pivot joint, and the other two points of suspension are in the ball and socket bearings of the intermediate shaft, which are riveted to the two main I beams. This method of

Digitized by Google

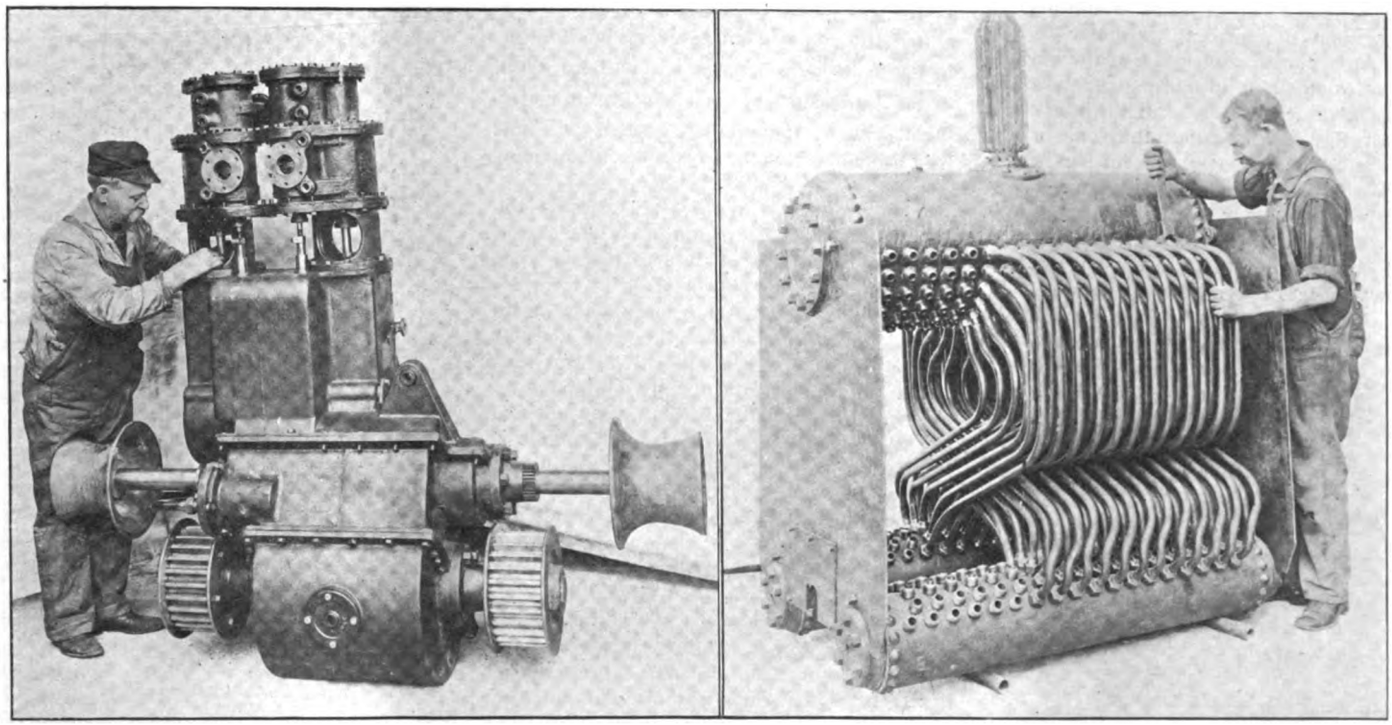
suspension prevents any strains in the frame from being communicated to the engine or transmission gear. The power is carried from this shaft to the rear axle by two 5 in. x1½ pitch silent chains. The large sprockets are bolted to drums or quills. One quill is cast onto the rear axle and the other is a running fit upon it. Each quill carries a 5½ in. hub, over which the rear wheel is slipped and made fast. The outer rims of each of these quills form brake drums, upon each of which act two shoes, which are controlled by a small steam cylinder. The brake is very powerful and is double acting. Throughout the transmission the use of keys has been avoided wherever possible.

The entire rear axle construction is especially heavy. It is not in two parts, the quill construction leaving the rear wheels free to act separately. The axle itself revolves in two 5½ in. x11 in. bearings, which in turn support the rear springs. These, and indeed all the exposed bearings on the truck are well protected from dirt.

Special care has been given to the design of a wheel which will withstand the roughest usage. The hubs are very large, and the spokes are of steel. There are two metal tires between which are wood felloes. The rear wheels are fitted with 12 in. steel tires, which gives nearly 2 in. of tire surface for every ton of load carried. The front wheels have 7½ in. tires. The pulling strain of the engine is taken off the rear springs by struts, which are braced against the two 9 in. I beams. The front axle, which is under the center of the boiler, is of 4 in. stock and supports the main frame on pedestals. Helical springs are here used. The pivot axles are of nickel steel.

The oil tank, which holds eighty gallons, is underneath the body of the truck, just back of the boiler. It is made of 3-16 in. sheet steel. Under ordinary circumstances the tank will hold enough to carry the truck from thirty to forty miles. There is a hand hole at the top and an outlet at the bottom so that the tank can be easily cleaned.

The steel water tank is hung at the rear of the truck. It has a capacity of 250 gallons. There are drains on the bottom and a manhole at the top which is large enough to render it easy not only to wash out the tank, but to scrub it with a broom if necessary, or to get inside for painting. The water tank is ordinarily filled by a steam siphon to which is connected a 1½ in. hose. This is always carried with the machine on a convenient bracket. On the front of the water tank is mounted a small duplex steam pump, which may be used to fill the boiler when the engine is standing still.



The driver's seat is on the left hand side of the boiler, there being a seat on the opposite side for a helper. In front of the driver are the water gauge glass, which is of the reflex type, and also the valves which control the machine. The throttle is of an entirely new design. It is so made that when the lever is pulled back from the center steam is admitted to the engine; but when the lever is thrown ahead of the center the full boiler pressure is admitted to the brake cylinder before mentioned, and the machine is brought almost immediately to a full stop. If for any reason the brakes should fail to work the engine is amply strong to withstand the strength of reversing under steam.

The valves for admitting steam to the low pressure cylinders and to the steam pump are close to the main throttle lever. Steam may be shut off from all parts of the machine by a main gate valve placed close to the boiler.

It is possible to back the machine down into an excavation and bring it out under its own power. Knowing the general character of the ground in such a place, the truth of this statement may be doubted. The assurance of the possibility of such a feat is, however, not based upon the ability of the truck to pull itself out by tractive power. On each end of the intermediate shaft there is a capstan. It is possible to throw the engine out of gear with the main transmission so that it acts only upon the shaft bearing these capstans. Hawse eyes are provided at the front and at the rear of the machine. By tying one end of a rope to a tree or telegraph pole and bringing it back through the eye to the windlass it is possible to lift the truck out of any kind of a hole, so long as the tree stays in the ground. These windlasses may also be used in connection with jib cranes, of which there is one of two tons capacity on each side of the machine. By the aid of these cranes it will be possible to load the machine in a very few minutes.

There are two items which affect preeminently the cost of trucking; one is the rapidity with which the moving itself may be done, and the other is the time spent in loading and unloading. There is no doubt whatever but that runs may be made more quickly with a motor vehicle than with a horse, but the matter of loading and unloading is something to which little attention has been given.

With the horse drawn vehicle the methods

ENGINE AND BOILER OF THL MORGAN TEN TON TRUCK.

Digitized by Google

of mechanical loading are very few, and in every case which has come to notice, the loading mechanism is entirely outside of the vehicle, or is found in a hand winch at the front of the truck. When, however, the work of transportation is to be done by a machine the problem becomes simpler. The two cranes and the capstans have already been mentioned. These will, of course, aid greatly in taking on heavy loads of almost any description where the places of stopping are many. It is possible, however, when regular runs are being made, with two or three regular stopping places, to reduce to a minimum the time that the wheels must stand still. To accomplish this, a system of interchangeable bodies has been carefully worked up, for which a number of broad patents have been granted. The particular system to be installed would depend largely upon the general character of the work. An accurate description of the various systems would take up more space than can here be given; but in general the idea is as follows: Say, for instance, that one of the trucks is to run between two stations; from two to three bodies—and these are very strongly and cheaply built—would be supplied with each truck. At each station slips would be let into the platforms. When the truck backs into one of these slips the body is left upon the platform in such a way that it is possible for the trucks to run out from under. While this body is being loaded the truck can back into a second slip and there pick up a loaded body. This dropping and picking up of the bodies would occupy ordinarily but two minutes, as against anywhere from thirty minutes to an hour or more with the old system. These bodies are of a nominal cost as compared with the original cost of the truck, and by employing them it is possible to at least double the efficiency of the truck, and in that way cut in two the cost per ton of carrying material.

Olds Silence Gossip.

Following the recent New York-Boston reliability contest it was common gossip that the Oldsmobiles, that made such proud records in the run, were special machines built for the occasion. The charge was so freely talked of that the Olds people finally placed the two vehicles at the disposal of the Automobile Club of America for examination by two disinterested experts, and their reports agree that the gossip was without foundation.

These reports, signed by Edward Henry Cox and Richard T. Newton, affirm that the only departures from the stock carriages that could be found were an extra water cooling tank and a different type of mixer, which is now being regularly used.

"The engines have been looked over in detail," says Mr. Cox, "and I can vouchsafe for these two Oldsmobiles being as represented by the contestants. I tested the two and found the engine to be of the same dimensions as to size of cylinder, stroke of piston and cylinder capacity as machines previously sold by these people."

HOLDEN SUES FOR PRIZES

Unpleasant Aftermath of Long Island Club's Race Meet—What Treasurer Webb Says.

Out of the financial failure of the Brighton Beach (N. Y.) race meet in August last has grown what bade fair to become a racing scandal of the first magnitude. Investigation, however, makes it plain that the matter has been distorted and given undue prominence, and that steps are being taken to settle it out of court.

Last week Thomas Holden, Jr., brought suit against the Long Island Automobile Club for $150, alleged to be due him for prizes won at the race meet in question. He stated that he had made every possible effort to collect the money, but without avail. A check for $30 had been sent him in settlement, but he indignantly refused it. Suit was therefore brought to recover the amount due him.

From Frank G. Webb, treasurer of the Long Island Club, to whom the Motor World man went for further information, a very different story was obtained.

"It is true that the club lost money on its meet," he said, "and that the prize account has not yet been entirely settled. But that is not the whole truth. Every dollar due by the club will be paid; in fact, every bill has been paid except those for the prizes, and of these there are just two cups and the prizes won by Holden and H. S. Harkness yet to be accounted for. Mr. Harkness is not uneasy about his money. He gave us the time we asked for, and throughout has been very courteous.

"In Holden's case there is a claim for entry fees to offset his claim. We were willing to pay what we owed him and offered to do so. Now that he has brought suit we have taken legal advice and find that there is one weak point in our case. We should not have waived the entry fee temporarily, as we did. Therefore, in the interest of the sport, and to avoid furthr scandal, we shall make the best settlement with him we can.

"The facts of the matter are these: We obtained from the Holden establishment entries for twelve races, the entrants including Thomas Holden, Jr., who brings the suit; his brother, L. E. Holden; H. A. Marble and others. Of these, the only one to win anything was Thomas Holden, Jr., who won $150. We were perfectly willing to settle with him upon the payment of the fees due us by his people; or to send him a check for the amount due him, less the twelve entry fees. But he wished to settle only for his own fees, three in all, letting the other nine remain unpaid. Naturally this did not seem to us the proper thing to do, and we refused to settle on these terms.

"The amount due for the twelve entries referred to is $120, while the amount won by Thomas Holden, Jr., is but $150. The difference, $30, we offered to pay him, even going so far as to send him a check for the amount, but he refused to accept it.

"As a matter of equity we are entitled to the entire twelve fees, they having all been given us by the Holden establishment and treated by the Holdens as their combined entries. Having made the mistake of accepting these entries without being accompanied with the fees, however, we shall accept the consequences of this act and pay Holden in full, less the $30 for his own fees."

Skinner's Boston-New York Record.

By driving his eight horsepower De Dion car from Boston to this city in 13 hours and 22 minutes, elapsed time, Kenneth A. Skinner last week recovered this coveted record, which he was the first to establish. With only a stop for dinner, he retraced his way, reaching Boston the next afternoon and making the first round trip record between the two cities, his running time being 32 hours and 22 minutes, or 8 minutes better than the time made by Harry Fosdick.

Accompanied by Albert Champion, Skinner left Boston at 3 o'clock on Friday morning and arrived in New York at 4:22 that afternoon. The return journey was begun at 8 o'clock, and during the night the two men suffered much from cold. It was not until Hartford was reached that daylight came, and from there to Springfield bad roads were encountered. Boston was reached, however, without mishap.

Civil Suit City's Recourse.

First blood was scored last week by the New York Transportation Company in its fight against the city police. Magistrate Mayo discharged the five chauffeurs, employes of the company, who were arrested in Central Park, charged with violating the ordinance requiring all public vehicles to take out licenses. The magistrate said he would advise the corporation counsel to bring a civil suit against the defendants.

Mason Acquitted of Manslaughter.

George A. Mason, of Buffalo, N. Y., who was accused more than a year ago of manslaughter, has been completely exonerated. It was shown last week that his striking Samuel Lippman was due to no fault of his. Justice White dismissed the case against Mason.

Now Packard Motor Car Co.

It is no longer the Ohio Automobile Co., the title of the well known Warren concern having been changed to the Packard Motor Car Co. The change is one of name only. The business will be continued just as before.

Changed Their Name.

The Shelby Motor Car Company is the new title of the Beardsley & Hubbs Manufacturing Company, Shelby, O. The change is one of name only.

COFFEE AND HIS NEW CAR

Virginian Effects a Transformation and Develops Departures in Motor and Other Features.

There is little resemblance between the Coffee gasoline car, which started in the A. C. A. non-stop run in May last, and the smart looking vehicle shown herewith. The latter is a well designed, soundly constructed car, with a motor possessing novel features,

R. W. COFFEE.

otherwise showing little departure from the conventional.

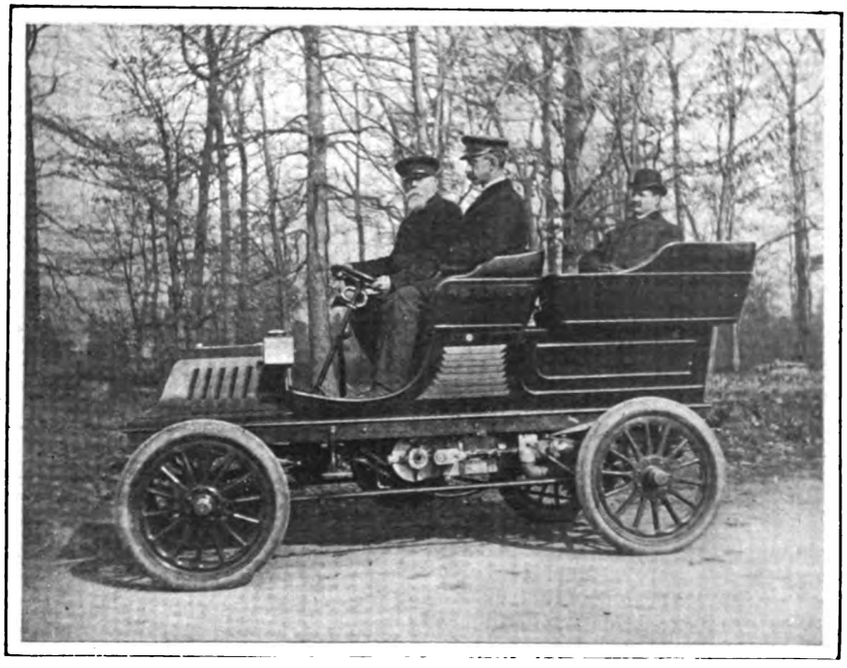
The car is the product of R. W. Coffee & Sons, Richmond, Va. The concern is an old established one, its line being the manufacture of general machinery. Some half a dozen years ago stationary and marine engines were added, and this naturally led to experiments with automobiles, and particularly with such parts as motors, carburetters, transmission gears, etc. The present car is the outgrowth of this, although even it is in a transition state. A number of changes are contemplated, and will probably be found in the company's standard vehicle.

It is the plan of Coffee & Sons to devote a great deal of attention to this department of their business. At the present time they are prepared to accept orders for their motors and carburetters, and in a short time will be similarly situated with regard to a new transmission gear which they are bringing out and to their complete gasoline car.

As will be seen, the present car is a tonneau, of approved type. The Motor World man was given a ride in it last week by Mr. Coffee, and found it to be a smooth running car, simple in its control and operation, and with ample power for any contingencies that might arise. The tonneau body was roomy and comfortable, while the long wheel base and the good sized tires contributed to smooth running.

A single cylinder horizontal motor, centrally located, developing 12 horsepower at 900 revolutions per minute, furnishes the motive power. This motor, called by its makers the "Binate," is of peculiar construction. Two pistons, with the rod of one placed inside the other, travel in opposite directions. The charge is introduced between the two piston heads, and is compressed as they are brought together. The explosion forces them apart, causing the crank of one to pull on the shaft while the other pushes it in the opposite direction, thus neutralizing the shock and causing the car to run with a very noticeable smoothness.

The transmission is of the Upton type, having two speeds forward and a reverse. A roller chain carries the power to a differential on the rear axle, but this is merely a temporary device. In the later vehicles the regulation Panhard transmission—except that the new Coffee gear changing device referred to—will be adopted, and the motor will be of the vertical type, placed forward under a bonnet.



A float feed carburetter of simple design is fitted. A needle valve regulates the supply of gasolene, and once set it need not be adjusted for climatic changes. The motor is water jacketed, the supply being carried under the hood at the front of the car.

Wheel steering is employed, and the method of control is very simple. A foot lever applies the reverse, a hand lever makes the speed changes, and two small levers at the side of the front right hand seat regulate the admission of gas to the explosion chamber and advance or retard the sparking, respectively. The ignition is by magneto, with storage batteries for starting.

The gear changing device referred to is a particularly ingenious piece of mechanism. It is compact, simple and reliable, thoroughly efficient and remarkably free from friction. It has already been shown to manufacturers interested in gears and very favorably commented on. A special push will be made on it by Coffee & Sons, who are represented in this city by Charles E. Miller, 97 Reade street.

A practical man himself, it is not surprising that the senior member of the firm, Mr. R. W. Coffee, should be thoroughly conversant with everything appertaining to the details of automobile construction. Aside from that, however, his personality is interesting. His flowing white beard gives him a patriarchal appearance, and his unhurried speech, which to the initiated stamps him unmistakably as a Southerner, has a "before-the-war" flavor that is as attractive as it is unusual in this busy city.

These are the days, and there are many more of them ahead, when oil gums readily and when the injection of a thimbleful of gasoline to free the piston rings will save many minutes of weary "grinding" in getting the engine going.

COFFEE'S 12 H. P. CAR WITH BINATE MOTOR.

Recent Incorporations.

Houston, Tex.—Hawkins Automobile and Gas Engine Company, with $20,000 capital, to engage in buying and selling automobiles, gasolene and other engines. Incorporators: C. Bender, Jr., A. I. Sallers and George W. Hawkins.

Augusta, Me.—National Automobile Company, with $500,000 capital, to make and deal in automobiles. The officers are: I. L. Fairbanks, president, and J. Berry, treasurer.

Providence, R. I.—People's Rapid Transit Company, with $25,000 capital, to operate a passenger transportation line. Incorporators, John P. Thompson, Jeremiah A. Angell, Herr Prest and Frederick D. Grove.

His Objections to One-Piece Motors.

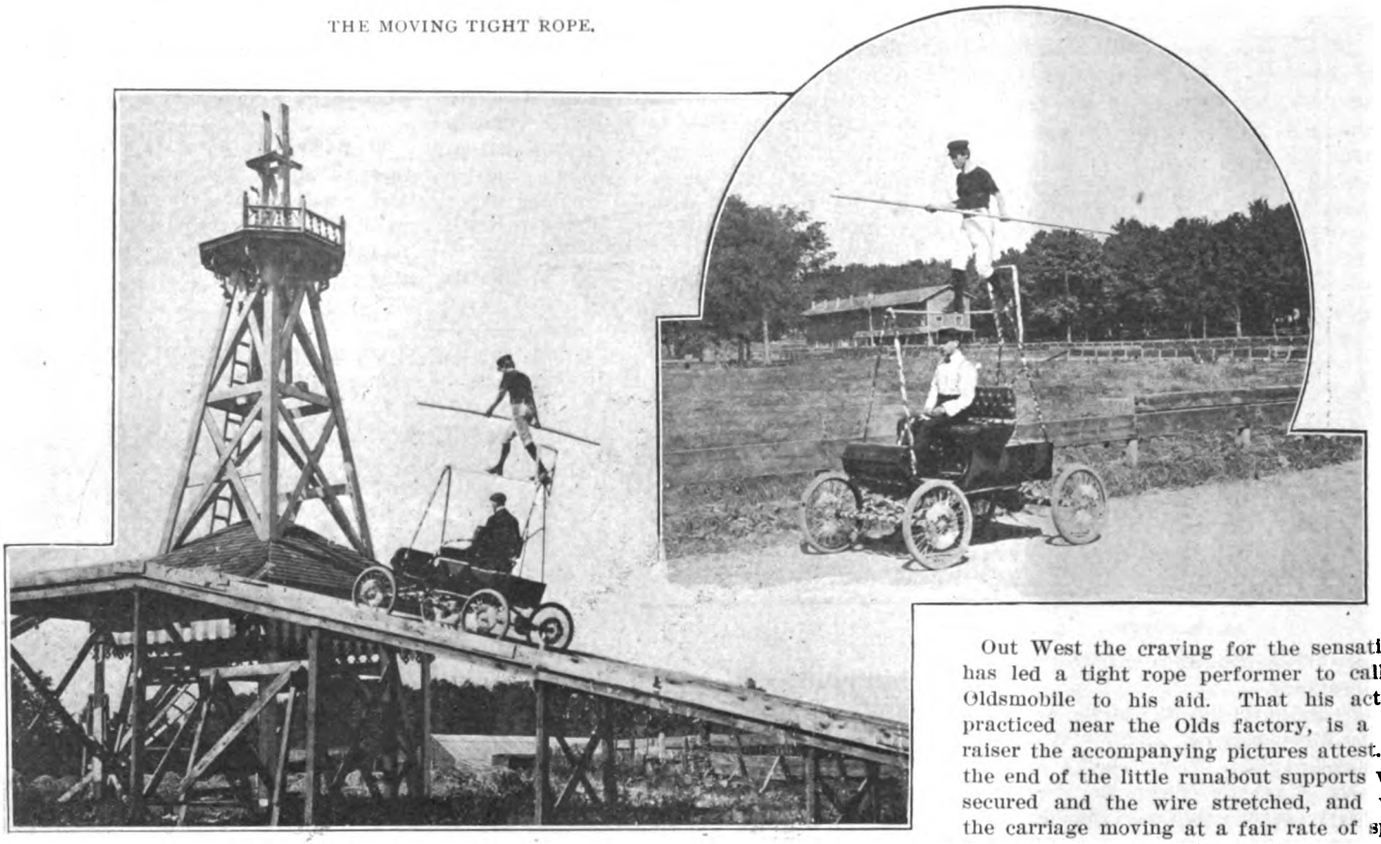
Cylinders and cylinder heads cast in one piece is one of the noteworthy tendencies in modern car design. The advantages of this method of construction are manifest as well as manifold, yet arguments on the other side are not lacking.

"It seems to me that it is hardly a wise move to do this," said one man, who makes a car with a vertical engine, in reply to the Motor World man's question. "If the only objection was that it was putting too many eggs in one basket, that would be a weighty one.

"You see, there are so many things to consider. With this construction the difficulty of getting at the parts is enormously increased. You have to take the entire engine to pieces frequently in order to make some minor repair. Then think what happens if anything breaks. Take the rough casting, even. It's hard enough to get castings that will not develop blow holes or other imperfections, and the chances of their going wrong would be vastly increased if the cylinder and head were in one piece. Think what it would cost if the castings were found to be imperfect.

"On the other hand, there's no getting away from the fact that the present method—with the two parts separate—is a satisfactory one when the work is done right. It is not so very difficult to make a tight joint if you know how. For my part, I shall stick to the good old way."

Behrens & Bushnell, Ivoryton, Conn., have fitted up their shop to do automobile repairing.



One Year for the "Captain."

In the Court of Special Sessions, New York City, last week, the punishment of "Captain John Pearson" was made to fit his crime. The "Captain" had passed himself off as a brother of President Johnson of the Automobile Club of Great Britain, and on the strength of it had "touched" Secretary Butler of the Automobile Club of America for a $10 loan. Shown to be an impostor, he was sentenced to pay a fine of $10 and undergo one year's imprisonment.

Leggett Elects Officers.

The recently formed J. S. Leggett Manufacturing Company, Syracuse, N. Y., met last week and elected officers and directors to serve for the ensuing year. They are as follows: President and manager, J. S. Leggett; secretary and attorney, Charles W. Tooke; treasurer, William A. Wynkoop. The directors are: Forest G. Weeks, Charles W. Tooke, John S. Leggett, William A. Wynkoop, all of Syracuse, and Edwin R. Redhead, of Fulton.

THE MOVING TIGHT ROPE.

Out West the craving for the sensational has led a tight rope performer to call an Oldsmobile to his aid. That his act, as practiced near the Olds factory, is a hair raiser the accompanying pictures attest. To the end of the little runabout supports were secured and the wire stretched, and with the carriage moving at a fair rate of speed the performer not only walked the rope on a level but also while the machine climbed the 25 per cent grade up which all Oldsmobiles are sent before leaving the factory. It was their quiet running and freedom from vibration that induced the "artist" to select an Olds for his act.

Ravages of Calcium Chloride.

An autoist who uses his car steadily throughout the winter, and is therefore compelled to take precautions against frozen water pipes, etc., had rather a disastrous experience.

"I put in a solution of commercial calcium chloride and water to a specific density of about 1,100," he says. "This effectually cured any freezing, but toward the end of the winter, having occasion to take off the water jacket covers on the cylinders, I found that the whole of the iron or steel studs which secured them to the cylinders had been eaten away, and any parts which had come in contact with malleable iron were also affected. I at once discontinued the calcium chloride solution, and could not recommend any one to use it as a preventive.

"It did not seem to affect the copper pipes or brass fittings at all, or even the castiron, but the action upon the iron or steel was very decided."

December 6 is the date selected by the Long Island Rhode Island Automobile Club for its first "smoke talk."

The Automobile in Society.

In what a local paper describes as "the biggest dancing event Kokomo ever knew," that Indiana town has given the social world a new wrinkle, and one full of suggestive possibilities for those cotillion leaders who are ever seeking the new and novel—nothing less than an automobile-led grand march. The innovation was inaugurated last week on the occasion of the "warming" of the new addition to the Haynes-Apperson factory, which was made a social function, the sensation being created when Mr. and Mrs. Elwood Haynes appeared on the floor in an automobile and skilfully led 119 couples through the mazes of the opening march. The size of the room—300 by 45 feet—easily permitted of the vehicle's manœuvres.

SEEKS AUTOCAR'S $500

New Yorker Bids for the Prize for a Kerosene Motor and Names His Conditions.

Editor the Motor World:

In your issue of November 13, on page 21A, at the bottom of the centre column, is the statement that "A prize of $500 is offered by the Autocar for a practical and satisfactory device which will enable paraffin (kerosene) to be used on existing cars."

That kerosene oil, the ordinary lamp oil known as astral oil of 150 degrees, has been used for the last four or five years on a cycle motor is an established fact, and one that is well known to motor builders in England as well as in this country. Probably the best known motor using kerosene oil as fuel in England is the Preistmay motors, also the Hornsby-Arkroyed.

In this country we have the latter, built by the De La Vergne R. M. Co., foot of East 138th St., New York City. We also have the Meitz & Weiss engine and the New York kerosene engine, the M. & W. being a two cycle, the latter a four cycle motor.

These all have that one great objection, excess in weight, and for automobiles could not be used. I have recently seen and tested an oil engine that for marine and automobile use is far ahead of any motor or engine on the market.

It seemingly is a peculiar thing that this new engine coincides with that described by Captain C. C. Longbridge in your November 13 issue.

The line drawing of the fore and aft compound gives the following dimensions: 30 inches long and 20 inches wide, 30 inches high, from 800 to 1,000 R. P. M., and weight 500 pounds.

If the Autocar is prepared to pay $500 and to stand the expense of the change from gasolene to paraffin (kerosene oil), I am prepared to make the necessary changes.

The one request that I have to make is that I be allowed to pick out a four cycle vertical motor.

As to my position, would say that I was general manager for the Hirsch Marine Motor Company, who were, I believe, the first to use the horizontal or opposed cylinder type now so popular among the builders of automobile motors; was the first president of the New York Marine Power Company, builders of kerosene oil engines for marine use, and lately have been elected as president of the M. & R. Engineering Company, builders of the Raabe compound internal combustion engine, the M. & N. kerosene oil engine and the M. & N. gasolene engine.

These are built for marine, automobile and industrial uses. Various marine specialties are under way, and will be exhibited at the new offices and salesrooms on or about January 1, 1903.

Am prepared to give a bond, if necessary, to cover the cost of the motor and engine selected for me to make the change from gasolene to kerosene, and motor can be entire American or English design or build.

Trusting this will reach the proper authorities, that an agreement will be drawn binding upon both parties, the Autocar, being a foreign publication, should, however, as an evidence of good faith, deposit the $500, together with a sum deemed necessary for the payment of the necessary changes, material, labor, etc.

Kindly refrain from using my full name.

G. R. W., New York.

Fisk Will Sell Firestones.

Recognizing a constant demand for solid rubber tires, and their factory at Chicopee Falls, Mass., being taxed to the utmost on Fisk bicycle and automobile tires, the Fisk Rubber Co. has completed arrangements to represent, exclusively, the Firestone Tire and Rubber Co. in the cities of Springfield, Syracuse, Buffalo and Detroit, where they have branches, and are prepared to quote prices, deliver and attach the Firestone Side-Wire solid tires.

Their motto is "high grade," and the product of the Fisk factory is never allowed to fall below the highest possible standard. In selecting a solid tire of another make they believe results in the past justify their adopting the Firestone, and can, by handling that tire, not only better meet the varied needs of their customers but also increase their business without sacrificing anything in the pneumatic line.

Disadvantages of Mild Steel Shafts.

For small crankshafts, connecting rods, etc., a rigid steel of high tensile strength—at least 45 to 50 ttons, with even lower phosphorus—is the preferable material. A milder steel retreats before impact, yields and deflects; and it is this repeated deformation that does the damage. This is especially the case where, as in high speed singe-acting explosion engines, the stresses of torsion and bending are so quickly and frequently repeated and reversed. The elastic limit and ultimate tenacity of these higher tensile steels is very much higher than those of milder quality; and as they are rigid and unyielding, there is no deflection to add to the strain of the metal and to wear down the inner sides of the bearings, and thus aggravate the bending tendency.

Benz to Change Transmission.

It is reported that the 1903 Benz cars have undergone a radical transformation, and all the former characteristics of the construction have disappeared. The motor rests vertically in front and the power transmission is by friction direct on the rear axle.

The Benz is a German make, one of the oldest in the motor vehicle field. Horizontal motors and belt drives have been fundamental principles with the company until now, and the complete change referred to is the more notable on that account.

COST OF HAULAGE

Comparisons That go to Show the Economy of Motor Trucks—Costs per ton Mile.

Motor trucks are so few in number that little data bearing on the cost of mileage and maintenance is obtainable. That they will prove a substantial saving over the horse drawn vehicles is of course generally believed, but lacking the figures born of practical usage it is only possible to arrive at estimates, of which that made up by the Morgan Motor Co. is about the most reliable that is available. It certainly does not lack interest, and makes out a good case for the motor driven truck, as the following figures attest:

COST OF HAULAGE BY HORSES.

Four horses, at $200	$800	
Team, at $500	500	
Harnesses, at $50 per horse	200	
Blankets, at $1.50 (two sets)	12	
Stable extras (brushes, harness dressing, etc.)	25	
Cost		$1,537
Depreciation 10 per cent per annum of vehicle	$50	
Depreciation 25 per cent per annum of horses	200	
Depreciation 25 per cent per annum of harnesses	50	
Depreciation 100 per cent per annum of blankets	12	
Depreciation 100 per cent per annum of brushes, etc	25	
Total depreciation		$337.00
Wages		1,300.00
Feed (365 days)		730.00
Shoeing	$350	
Veterinary services	100	
Maintenance of vehicle	75	
Maintenance of harnesses	20	
Total maintenance		$545.00
Interest on investment, at 5 per cent		61.85
Insurance, at 1½ per cent		21.55
Cost to operate		$2,995.40

Assuming that a four horse team travels a total of 15 miles per day, and that a load is supplied only one-half the time, or, in other words, that there are 7½ carrying miles. With a load of seven tons the ton mileage is 52½. This, multiplied by the available days in the year, which may be taken as 275, gives a yearly ton mileage of 14,437. The yearly cost to operate, divided by this figure, gives the cost per ton mile as $0.208.

COST OF HAULAGE BY MOTOR TRUCKS.

Cost	$7,500
Depreciation, at 15 per cent per annum	$1,125
Interest, at 5 per cent	375
Insurance, at 1½ per cent	112
Wages	1,300
Fuel (275 days)	770
Lubricating oil, at 50 cents per day	187
Spirits and waste	50
Maintenance and repairs	300
Cost to operate	$4,219

Assuming in this case that the machine runs 40 miles per day, of which, as above, only one-half the distance is covered with a load, the total ton mileage will be 200. This, multiplied by the 275 days, gives a total ton mileage of 55,000. Dividing the yearly cost to operate by the yearly ton mileage, the cost per ton mile of $0.0767 is obtained.

AT LAST
A $550 AUTOMOBILE.
"MOBILE"
A RUNABOUT

THIS BRINGS THE AUTOMOBILE FOR PLEASURE AND FOR BUSINESS WITHIN THE REACH OF ALL.

A $1085 Delivery Wagon

(Automatic Water Regulation. No Water-Glass.)

THIS BRINGS THE AUTO-DELIVERY WHERE NO MERCHANT CAN AFFORD TD USE HORSES.

THE "MOBILE" COMPANY OF AMERICA is now equipped to turn out on the largest scale more than twenty kinds of motor cars. The prices here made are such as can only be offered under conditions of large production.

They are equipped with "Mobile" low water alarm, steam air pump, and positive-speed oil pump. The Delivery Wagon uses no water-glass, the regulation of water-level being entirely automatic.

Good Agents wanted for all parts of the country.

The "Mobile" Company of America,

Makers of "THE BEST STEAM CAR IN THE COUNTRY,"

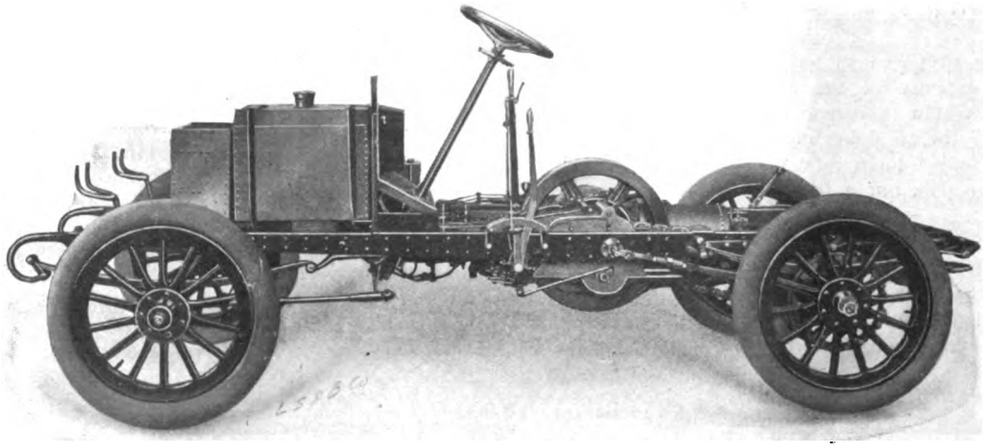
Kingsland Point, Tarrytown-on-Hudson, New York.

N. Y. C. & H. R. R. STATION, PHILIPSE MANOR.

BRANCH HOUSES in San Francisco, Los Angeles, Denver, Chicago, Boston and New York:

Cock's Law Unconstitutional?

A solar plexus blow was struck at the Cocks law on Tuesday, and if the ingenious contention put forth by Attorney Schoonmaker is sustained that malodorous measure will pass into innocuous desuetude.



Before the Court of Special Sessions at Jamaica, Long Island, in defending Mason Crocker, chauffeur for Reginald Vanderbilt, who was arrested on October 19 last for violating the speed regulations, Attorney George W. Schoonmaker questioned the constitutionality of the Cocks law.

He said the law was similar to that in regard to cruelty to animals, both being under section 666 of the Penal Code, section 668 of which stipulates that fines shall be paid to the Society for the Prevention of Cruelty to Animals. It was Mr. Schoonmaker's contentiton that it had been held that these fines were public money, and that as such it was unconstitutional to pay them to a private corporation. He declared that fines under the automobile law were subject to the same decision.

The question was argued at some length, and Justice Fleming, who presided, became so impressed with the matter that he adjourned the trial of Crocker until December 9 next, in order that the law on the question might be thoroughly investigated.

At a meeting of the governors of the Automobile Club of America the following new members were elected last Friday: Colgate Hoyt, M. P. Jones, John A. Drake, T. E. Griffin and Frank W. Haskell.

THE NEW STEARNS' IDEA.

CHASSIS 24 H. P. TOURING CAR.

You will note a great many good features that are near and dear to the owner's heart. The completed car combines them all.

Place your orders now, so you will have your car in season.

THE F. B. STEARNS COMPANY, Cleveland, Ohio, U. S. A.

MOTOR VS. HORSE

Another Comparison of Costs That Redounds to the Credit of the Motor.

Figures showing the comparative costs of keeping horse drawn and motor driven vehicles in commission have been compiled by a tradesman of this city. They confirm the belief entertained that, when a calculation is made of all the items pertaining to upkeep, etc., as well as of first cost, the advantage is all in favor of the motor vehicle.

The cost of a fashionable driving outfit for city use during the winter and spring, for shopping, calling, park use, etc., is found to range from $3,030 to $6,610, as follows: Brougham, $1,200 to $2,000; victoria, $800 to $1,800; two horses, $600 to $2,000; double harness, $300 to $500; single harness, $100 to $250; stable clothing, stable tools, halters, etc., $30 to $60. Total cost, $3,030 to $6,610. The expenses of maintenance for stable, feed, etc., but not including hire of coachman, would be about $100 a month.

A similar motor outfit will cost from $3,800 to $7,500, as follows: Electric brougham, $2,000 to $4,000; electric victoria, $1,800 to $3,500. Total cost, $3,800 to $7,500.

The monthly cost of maintenance, however, not including coachman, should not exceed $70, and in addition the electric outfit is capable of four times the daily mileage of which the best horses would be capable. In other words, a lady could have her carriage every day at the door after breakfast to convey her children to school and her husband to his office, back to the house before 10 a. m. for her to shop, back (after the mistress and coachman have lunched) for calling, receptions and a park drive; back (after the owner's family and coachman have dined) to go to the theatre, supper, and return home about 12 p. m., and yet no exhaustion of the power, no lame horses, and an ability to repeat the performance day in and day out.

The coachman, moreover, has no horses to clean or feed or bed for the night each day; no harness to wash, soap, and polish after each trip (no matter how short); no necessity for going constantly to the farrier and wasting the precious time of his mistress while the horses are being shod, and no good excuse to offer why he should not always be on hand at the request of his employer.

He cannot keep for himself, as his little perquisites, his monthly commissions on feed, stabling or shoeing, nor can he get his percentage on all new horses bought to replace lame or sick ones. He cannot buy sponges, soap, currycombs, brushes, etc., by the score, nor keep his employer's bank account constantly depleted with bills for new harness, new blankets, repairs, etc.

In the case of a light driving outfit for park or suburban use the advantage of the motor vehicle is much greater. The horse outfit will cost from $660 to $1,630, as follows: Buggy or runabout, $250 to $400; horse, $300 to $1,000; harness, $100 to $200; whip, $5 to $10; stable clothing, halter, etc., $5 to $20. Total cost, $660 to $1,630.

The monthly cost of maintenance would be about $40. A steam carriage capable of covering several times the daily mileage of the horse would cost from $600 to $950, or a gasolene runabout from $650 to $1,300, and the monthly cost of maintenance should not exceed $25, giving a considerable advantage in favor of the motor vehicle, not only in operating expenses, but in initial cost as well.

Either of these types of motor vehicles would be capable, moreover, of many times the daily mileage that any horse could possibly perform and remain in serviceable condition for any length of time.

AN OLDSMOBILE IN "FIGHTING TRIM."

Court Holds Garage not a Nuisance.

That a garage or automobile station is not a nuisance is held by Justice Smith, of the Supreme Court of Queens County, N. Y., who ruled on the matter last week in a case before him, as stated in the Motor World.

In his decision Justice Smith says:

"I find that the building of the defendant is not a nuisance, and the business conducted therein is not a nuisance. The action cannot be maintained on the theory that the plaintiff is entitled to a judgment that the building may be removed or its use enjoined for the storing of automobiles, because neither the building nor its use amounts to common law nuisance.

"That the construction and use of the southerly extension of the building do not in itself violate the construction covenant, and that the plaintiff is not entitled to judgment that any portion of the defendant's building be removed, or that the defendant be restrained from conducting the business of storing automobiles therein as at the present time conducted."

The suit was brought by a resident of Arverne, L. I., asking that Lyons be restrained from erecting a building designed for a garage adjoining his house.

A special competition for a noiseless petrol (gasolene) car is to be organized by the technical committee of the Automobile Club of France.

WATCHING THE BRIDGES

Long Island Automobile Baiters Change Tactics —Doctor on Life Saving Mission a Victim.

Another of the hidden iniquities of the iniquitous Cocks law bids fair to rivet attention to it, through the belated enforcement of one of the provisions of the measure.

Four miles an hour is the maximum speed permitted in this State while crossing bridges; but heretofore the clause has been suffered to go unenforced. Consequently no one has been fined or sent to prison for the crime of equalling a slow walk while crossing bridges.

Last week, however, the indefatigable Long Islanders sprung a new game. Automobilists having grown wary, and the crop of victims of the tin can signal apparatus being unusually small, a new field of usefulness was sought and found. An automobilist was arrested for crossing a 15-foot culvert at a greater speed than four miles an hour and fined $25.

As related by one of the victims, the physician, the story is as follows:

"Several weeks ago I was called to make a hurried visit to a very seriously ill child of a family living twenty-eight miles away. Owing to the urgency of the call and the fact that there was no available railroad communication in time, I was conveyed in an automobile by the anxious father of the child. In the course of the journey the father, who was running the machine himself, was most considerate and conscientious in keeping not only 'within the law,' but voluntarily stopped for horses no less than five times. Moreover, when in the neighborhood of Brookhaven, he slowed down to a walking speed, a rate at which I could easily have kept pace with the machine at an ordinary walking pace, and called my attention to special signs warning automobilists to 'cross bridges at four miles an hour,' etc.

"He observed the fairness of such a regulation, and remarked that he always took care not to violate the law.

"While illustrating practically this extraordinary caution and while speaking of the law we crossed a plank culvert about fifteen feet wide, and the moment the wheels left the 'bridge' two men jumped out of the bushes and in true road agent style yelled 'Stop!'

"To our utter amazement they charged us with violating the four-mile regulation, and delayed us the better part of an hour, requiring us to return to the nearest justice—Howell by name—who imposed a fine of $25.

"The anxiety of my friend doubtless prompted him to pay this outrageous fine—much against my inclination, for I am sure it was an injustice added to audacious cruelty in interfering thus in the rendering of urgent medical services. To cap the climax of this peculiar administration of justice (?) we were told that even if we had tried to observe the law conscientiously we were simply unfortunate, as 'the innocent had to suffer for the guilty.'"

Hail! the Automobile Novel.

There is one thing that is pretty well assured, and that is that whoever begins "The Lightning Conductor" will finish it. The "Conductor" is the most pretentious "automobile novel" that has yet appeared. It is from the joint pens of C. N. and A. M. Williamson, the former an English woman automobilist, and is brought out in this country by Henry Holt & Co., New York.

The book is a panegyric of "motors and motoring," as its authors would put it, linked with a pretty and pleasing love story and an entrancing story of travel through France and Italy.

The automobile part, with one or two slight lapses, is soundly written and with point. If the story does not fire the blood of its readers and give birth to a desire to emulate the doings of the heroine and hero—a pretty American girl and a young Englishman—it will be surprising.

The appended extracts will give an idea of both the style and matter:

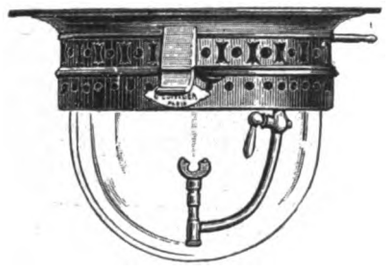
"This time, with one turn of the handle, the motor started, so contrary is this strange beast, the automobile. One day you toil at the starting handle half an hour, the next the thing comes to life with a touch, and nobody can explain why.

"Across this vast plain we raced toward Salon along a road straight as if drawn by a ruler, and bordered by small poplars standing shoulder to shoulder like trees in a child's box of toys. We met no other vehicles; we seemed to have the world to ourselves; but once, far along the road, we spied a black dot which seemed to come toward us with incredible speed, growing larger as it came. In less time than it takes to write we saw that it was an enormous racing automobile, probably undergoing a test of speed. We were running at our own highest pace, perhaps forty-five miles an hour; the thing approaching us was coming at seventy or more. You may imagine the rush of air as we passed each other. One glimpse we had of a masked automobilist like a figure of death in an Albert Durer cartoon, or the familiar of a Vehmgericht, and then we were gasping in the vortex of air caused by the speed of the gigantic car. Almost before we could turn our heads it was a black dot again on the horizon. Perhaps it was the great Fournier himself.

"The worst of driving an automobile yourself, when you've really got that microbe in your blood, is that you don't see quite as much of the country as you would otherwise, and that you hate to stop even when there are wonderful things to see."

At all the local garages and other automobile establishments in this city the remarkable way in which the season is keeping up is exciting comment. The chief factor is the weather, of course. As long as it continues fine, and balmy, sunshiny days allure autoists and would-be autoists, no other result could be looked for. Buyers have not altogether disappeared, as a visit to the leading salesrooms will demonstrate.

When Spokes Shrink.



"Do wood wheels shrink and warp?" repeated the dealer who deals extensively in cars so fitted. "They do indeed. Changes of temperature, as well as moisture, affect them considerably.

"But it is not such a difficult matter to put them to rights. Ordinarily it is very simple. If a spoke shrinks a little and begins to rattle, we merely loosen the bolts in the hub and slip a bit of cardboard between the spoke end and the hub. Then we screw the bolts up again, and the job is done. The spoke is tight again and can't rattle.

"This can be done only when the shrinkage is not great, however. Still, we make repairs of this kind every week, sometimes every day. It's a good tip, as we found out long ago."

Hangs From the Roof.

The lighting of automobiles is attracting more and more attention. For broughams and other covered vehicles the peculiarly shaped lamp shown has been designed by a

foreign firm. It is fitted to the roof and connected by copper tubing to a Ducellier generator, which occupies a very small space and can be fixed beneath the driver's seat.

Camaraderie of Automobiling.

"One thing that impresses me strongly about automobiling is the camaraderie that seems to exist everywhere," remarked an autoist to the Motor World man. "The mere fact of being in an automobile is cause for a display of good fellowship.

"The other day I was out on the Pelham Bay Parkway, and, being troubled with a loose clutch, stopped to make an examination. In a few minutes a Winton touring car came along, and instead of going by without a word its driver slowed down, came over toward us and asked if he could be of any assistance. By that time I had recognized Percy Owen, and, returning his salutation, I thanked him and said that we were not in need of help. So he shot down the road and left us.

"It was a little thing, of course, but the spontaneous kindness of it warmed the cockles of my heart. The sight of a car in distress, even though its occupants were unknown, aroused Owen's sympathy, and his first thought was to extend aid. It was but one of many similar cases that have come under my observation."

Hand Pumps on Steamers.

Probably no feature of the steam vehicle has been the subject of more comment or had more fun made of it than its hand pump or pumps. The observer who objected to being billeted to a steam car in the Reliability Contest because he had a weak heart, and was afraid he could not stand the pumping he was expected to do to help the operator out, has come in for lots of fun. In other runs and in races many witticisms have been got off at the expense of this feature.

"The reason is very simple," replied one of the steam car men to whom the query why automatic pumps were not used was put. "We want to keep the vehicle just as simple as we can. It would be very easy to have automatic pumps for the air pressure in the gasolene tank, for example. But we don't think it would be wise to fit them. There would be one more complication added, one more piece of machinery to look after and keep in order.

"We find that operators of motor cars have a preference for the simplest kind of machinery. As it is, they complain that there are too many things to get out of order. It is very easy to give half a dozen strokes of the pump every twenty minutes or so, when the air pressure gets low, and every one knows how to work a hand pump to do this. Or if more water for steam is needed than the normal supply, a little work with another pump will give it, and no thought and little time has to be given to the matter.

"But if this was done automatically the average operator would be having trouble constantly. He would not know enough or care enough to see that the automatic pump was in order, and the first intimation of anything wrong would be given when the device went on strike.

"No, I am firmly convinced that the plan of using hand pumps is best. Then the operator knows just what he has to do, and he does it."

Learns to Scent Out Water.

Much practice makes the operator of a steam car a veritable Sherlock Holmes in the matter of scenting out water. He early learns the importance of divining its presence. Time lost in hunting for it is time wasted.

Once every so often—thirty, forty or fifty miles, as the case may be—the time for filling up arrives. Travelling through familiar country it is plain sailing. Water troughs are to be found at certain places, and it seldom needs a look at the tank to see if the next trough can be reached without filling. But when one's "native heath" is left behind the intuitive faculties must be exercised. The presence of water is felt rather than seen; the "I guess my supply will carry me to the next trough" rarely turns out to be a false prophecy.

The twenty-sixth carload of Oldsmobiles shipped to San Francisco this season reached that city a couple of weeks ago.

CARE OF CLUTCHES

Some of Their Uses and Abuses—Need of Intelligent Manipulation.

"The modern motor car is designed and built more or less to withstand all ordinary stresses to which it may be subjected under varied conditions and treatment, and generally speaking the reputable cars are reliable enough in all their component parts when handled in an intelligent manner," says an across the water contemporary.

"A common cause of disaster, however, is to be traced to inexperienced handling of the clutch mechanism, by which under stresses are communicated to almost every part of the car.

"How much of this is due to faulty design, and what proportion is due to faulty driving, is not easily computed, but it is at least clear that many drivers rack their cars about most unmercifully by sudden application of the clutch, and bent connecting rods, stripped gear wheels, and other forms of breakdown might, if properly traced be found to have origin in careless clutch handling on the driver's part.

"First, let us consider the action of injudicious application of the clutch.

"The clutch is the connecting link between the vitality of the motor and the 'dead' car, and the car and its load may be anything from ¾ to 2 tons.

"It is, therefore, perfectly clear that if the clutch itself be properly designed to transmit the necessary motion to drive the load, that in the event of the clutch application being too sudden or severe an enormous stress is thrown on the whole of the engine and car parts, and no more certain way of smashing up a car in little time could possibly be devised.

"The makers naturally endeavor to devise a clutch which shall be quick or 'keen' in action and positive in drive, but it is clear that the more powerful the action of the clutch the greater the demand for delicate handling on the part of the driver, yet it is no uncommon thing to see a driver jump his clutch hard on and with the accelerator down, applying the maximum power suddenly, and in all probability checking the car by ramming all the brakes hard on a moment later.

"This, of course, is a showy method of driving, and conveys the impression of immense power and resource, but it is distinctly hard on the car, no matter how well it may be designed and constructed, and it is questionable whether it would not be better to sacrifice something of efficiency in the clutch to save the car—that is, in view of increased number of novices to be found driving powerful cars.

"Let us endeavor to follow the results due to an unduly severe application of the clutch. In the first place, the motion of the engine is suddenly arrested by the resistance of the load, and an enormous stress placed on the connecting rod, crank shaft and bearings of the engine.

"The transmission gear suffers next, and mostly in the gear wheels of the speed change mechanism and the bevel wheel teeth; but supposing all these stand up, then the road wheels take their share of the shock, first by a tendency on the part of the drive of whatever form to tear away the wheel spokes or the hub; but the most fatal results appear at the tires, for with jerky clutch application there must inevitably be a certain amount of skidding and actual surface wear, in addition to the tendency to tear the whole tire from the rim, and the setting up of friction between outer cover and air tube.

"Clutches are of various types and operating in different ways to the same end.

"First of all, there is the broad distinction between metal to metal faced clutches, and metal to leather faced clutches.

"Then in principle of action we have clutches in which an inner drum is caused to expand outwardly and engage with the inner surface of the driving clutch, but the most popular form is the conical clutch with end on motion, in which a male cone is held up to a female cone by a powerful spring, being disengaged by pedal pressure operating a lever, and so overcoming the action of the spring.

"This type of clutch, when in good working order, is probably the most efficient power transmitted, but it is also the one which is most subject to abuse in the hands of inexperienced drivers.

"The acme of perfection in a clutch would be one giving great delicacy of touch, as starting in combination with positive drive when put hard home; in other words, the clutch should be an elastic medium between the engine and the transmission gear.

"The trouble with most clutches is that they either do not fit correctly or the oil has worked between the surfaces, and if we analyze the action of the metal to metal clutch we see that after a certain amount of wear the two surfaces can no longer come into contact right across their face, because of the unequal rate of wear between in the inner and outer diameter, the surface speed, and consequently the frictional wear, being greatest at the outside or point of greatest diameter, so that, although further wear will tend to restore equilibrium in this respect, there will always be less grip on the outer circle; yet this is just where the grip should be greatest to insure an efficient drive.

"With leather lined clutches these conditions do not apply to the same extent, as the leather band, being a pliable medium, is simply compressed to an accommodating fit to the metal cone; on the other hand, the leather lined clutch is apt to be very fierce when new, and to slip altogether when it gets glazed over with oil and metallic particles.

"A little oil of the right kind is a necessity to the leather band, and when new this type of clutch should be dressed with castor or some other vegetable oil, in quantity merely sufficient to render it pliable and amenable to the pressure of the cone, as any excess will merely aggravate matters in the opposite direction by causing the clutch to slip, and so not drive the machine at all.

"Whatever the form of clutch, if it is found to be slipping, through lubricating oil having found its way to the clutch surfaces, the first opportunity should be taken to thoroughly wash it out with petrol.

"If the clutch is found to be slipping through the surfaces not engaging properly there is nothing for it but taking the whole mechanism to pieces and turning up the faulty surfaces, though in the leather lined clutch the job may be done without completely dismantling the mechanism, as if the leather band can be got at a coarse file or rasp may be used to trim the surface to a fit.

"Leather faced clutches, when clumsily handled, are usually more destructive to the car and themselves than metal surfaces, because if the clutch is frequently slipped in on the high speed the leather is charred and loses its nature, by reason of the great heat developed, thus necessitating a renewal of the leather bands.

"Many machines might be much improved by a little more care in adjustment of the clutch spring, as this spring plays a great part in the delicacy of working.

"The plan of treating slipping clutches with resin, chalk, belt compounds, etc., is to be condemned, as the influence on the leather is injurious, and the matter quickly glazes up, leaving the clutch worse than before.

"The three points to watch are good fitting surfaces, clean surfaces, careful adjustment of springs, and an intelligent application of the lever pedal at starting from a standstill, which should always be done at the lowest speed of the car."

Sues for Damage Caused by Dust.

About the most extraordinary charge yet made against an automobilist was that of damaging the furniture of a house by reason of the clouds of dust it kicked up. This was the basis of a civil suit brought at Stamford, Conn., last week by William F. Nettling, of New York, to recover $275 damages from V. N. Beach. Beach and Nettling were neighbors at Shippan, where each has a summer residence. Both men are wealthy, and the suit is said to be more the result of a strained feeling over social matters than the technical trespass.

The plaintiff alleges that on September 5 Beach, his chauffeur and another man unlawfully entered his premises in an automobile, kicking up clouds of dust, which damaged the furnishings of his house.

Beach admitted the trespass, but excused it by saying the wind blew off his hat, and the road was too narrow to turn his big machine about; he drove into Mr. Nettling's driveway to recover the hat, unconscious that there would be any objection.

Discussed Wheel vs. Lever.

They were partisans. Each saw in his own car the apogee of motorial perfection, and was loath to concede his opponent a single point of excellence, much less superiority. They got around at last to the steering of their respective cars.

"There isn't a man living who can get any speed out of a lever steering car," exclaimed one. "Nothing but a wheel will do at all. Why, a man takes his life in his hands if he attempts to go fast with nothing but a lever to steer with. A few years hence lever steering will be forgotten."

"Stuff and nonsense!" retorted his opponent. "You don't know what you are talking about. Lever steeering is the best there is, and so far from going out it will sooner or later be used on all vehicles except those used for racing purposes."

"I'll wager that I can take my lever-steerer and go where you can't follow me with your 'stemwinder.' We'll go down town, where the traffic is heaviest, and see who will make out the best in getting through it. Why, I could make a figure eight before you could get started to go by a team. It would be the same on rough roads. I could turn out of ruts and holes and forget all about them while you were making up your mind to wind up your alarm. And you know it, too."

"Well, maybe you are a little better at trick driving," admitted the first man," but an automobile is made for other things than to do 'stunts,' and if you want to do a bit of straight driving I'm your man."

Springfield's Sane View.

In the case of the automobile familiarity has bred decided liking. Abuse can permanently harm only when proof is lacking to refute it. Upon the appearance of such proof abuse falls to the ground.

"The people of New England, or at least that part of it through which lay the course of the recent New York-Boston reliability contest," says the Springfield Union, "are not deceived as to the new automobile, which is not a thing of terror, a new sort of bogey which is to turn our city streets and country roads into lurking places of sudden death, but a sane, reasonable and enjoyable sport which, with the improvement in manufacturing and lessening of prices from the present prohibitive limits, will become as much of a necessary luxury as did the bicycle and as, in time, may become the airship."

"Nursing" the Burner.

A sudden shift of wind, or even the emergence from a sheltered place to one more open, will often make the greatest difference in the burner of a steam car. Where formerly it had been impeccable it will take to cutting up "monkey shines" in a way that is aggravating and wellnigh uncontrollable. Care in watching and regulating the burner is the only remedy, and the result will depend largely upon the intelligence with which this is done.

Curious Cause of Stoppage.

A curious case of stoppage recently arose from a cause liable to affect any motor.

The car in question was traveling through very bad weather and awful roads, when it developed a fit of the slows. Stale gasolene, excess of lubricating oil and too rich a mixture were all laid under suspicion in turn, and as the car became slower and sometimes stopped altogether, and was very difficult to restart, successive sparking plugs were taken out and found to be very sooty; but the mysterious feature about the business was that even a perfectly new sparking plug effected no perceptible improvement.

Emptying the crank case and cleaning it with kerosene was equally ineffectual, and when it became obvious that the use of the air lever failed to effect a satisfactory regulation of the mixture, derangement of the carburetter was supposed, but upon complete dissection of the carburetter nothing could be found amiss with it. Yet mile after mile the car got slower, and at last failed to climb the least hill, and was eventually driven at a crawl, which ceased within a hundred yards of its stable.

At last the cause of all the trouble was traced to the fact that first dust, then moisture from the humid atmosphere that prevailed, had combined to form a cake of mud outside the gauze screen upon the end of the air intake pipe, resulting in thrattling the intake and causing such gas as did reach the engine to be too rich.

Where Castings Come From.

Most of the castings for cylinders and other engine parts come from Providence, R. I., where the difficulties incident upon turning out reliable work seem to have been better overcome than elsewhere. These castings are sold by the pound, and are nearly always guaranteed to be free from blow holes and other imperfections. Such guarantee merely means that if imperfections develop the defective casting will be replaced or an allowance made for it, credit being given for the cost. This covers only the rough casting, of course. No allowance is made for the cost of the work expended on it, which may amount to a great many dollars. It often happens that the machinery has been nearly all done and the part is almost ready to be assembled when an imperfection is discovered. Then the casting is worth just so much as scrap iron. With all their experience and skill, casting makers cannot foresee or eliminate these imperfections. By the exercise of the greatest care they are able only to keep them down to a minimum.

A handy article to have around a steam car—or a gasolene one, either—is a portable fire extinguisher, either of the fluid, chemical, or powder style. Many automobilists do not keep fire extinguishers even in their storerooms, and can only witness the total destruction of their vehicles if the gasolene chances to catch fire through carelessness or accident.

Why Some Bodies Lose Lustre.

It not infrequently happens that motor-carriage bodies finished in apparently the most perfect style by the Napoleons of the varnish room soon lose surface lustre or "deaden." The motorist, inexperienced in the ways of varnish and all that pertains thereto, naturally heaps maledictions upon the varnish when loss of gloss manifests itself.

A little investigation, however, should enable him to perceive that if a finishing varnish is possessed of sufficient quality to hold the full brilliancy of its coat to the maximum limit in one instance, it should, other things being equal, do so in another. This being true, it becomes necessary to look to some prior cause for the trouble. Lack of uniformity in methods and mixtures is a prolific cause of the deadening. Moreover, the most approved varnish under the manipulation of some workmen goes to a greasy smear upon the surface, whereas the same varnish, under the magic skill of still other workmen, develops the full strength of a superb brilliancy. The lustre of varnish depends in large degree upon the painter's skill in handling it under the brush.

An insufficiently hard paint fabric is a strong cause of varnish deadening. When time is at a premium in the paint shop, and the general atmosphere of the shop is not equal to the work of oxidizing or hardening the paint as fast as the circumstances of the case suggest, then the process of crowding one coat of paint upon another, at the risk of "lifting," or softening up the preceding coat, is introduced. The direct and logical outcome of the process is "deadening" in all of its various and villainous forms.

Horseman Condemns Horsemen.

It was a driver and not an automobilist who said: "I can't see why the horse papers should not join in the work that the automobilists have begun in trying to get horses reconciled to the motor vehicle. There are a lot of fool drivers who need advice, and they do not get it. I never had a horse shy at an automobile, let alone running away, but I wonder that there are not more runaways because of crazy drivers. No animal feels the agitation of his master more quickly or more keenly than the horse. If the driver gets rattled and excited it makes the horse nervous, and there are hundreds of drivers who lose their heads every time they meet an automobile on the road. I have seen them yell and dance and keep calling 'Whoa!' to a horse that had not shown any disposition to be fractious. If I was a horse in front of such a man I know I would bolt. Some of the horse papers ought to take a say in the matter and pound some horse sense into the drivers, who are more afraid of an automobile than is any horse."

Always strain the water as it is put into the tanks of a steam car; failure to do this sometimes results in the feed pump becoming chocked and failing to act.

The Week's Patents.

713,568. Non-Active Metal for Use in Storage Batteries. Henry H. Lloyd, Germantown, Penn., assignor to Electric Storage Battery Co., Philadelphia, Penn., a Corporation of New Jersey. Filed June 29, 1900. Serial No. 22,024. (No specimens.)

Claim—1. A non-active metal for use in and in connection with storage batteries and having the qualities of toughness, smoothness, resiliency, and a great mechanical strength in proportion to its weight, said metal comprising lead cast with substantially 12 per cent by weight of antimony and rolled in a cold state, as specified.

713,664. Spring Tire for Vehicle Wheels. James W. Mooring, Dunstable, England. Filed July 12, 1902. Serial No. 115,381. (No model.)

Claim.—1. A self-contained spring tire comprising an expansible and contractible band, means for tightening and locking the same around a rim, an outer ring or tread and springs interposed between the latter and the band, said band being movable circumferentially for expansion and contraction independently of the springs near the tightening and locking device, substantially as described.

713,732. Dust Cap for Vehicle Hubs. Joseph E. Beebe, Harlan, Iowa. Filed March 25, 1902. Serial No. 99,978. (No model.)

Claim.—1. The combination with an axle and hub, of a cup shaped cap inclosing the inner end of the hub and bearing against the shoulder at the inner end of the axle spindle, said cap having a slot in its body portion and opening through its rim by which it is adapted to be fitted on the rectangular portion of the axle, knuckles formed upon opposite sides of said slot having eyes therein, a removable section closing the opening in the rim and a portion of the slot and having a clamping head, the latter having eyes formed therein to register with the eyes of the aforesaid knuckles, and fastenings adapted to pass through the corresponding eyes of the cap and removable section to clamp the inner wall of the head and inner end wall of the slot against opposite sides of the axle, substantially as set forth.

713,736. Process of Manufacturing Rubber. Albert C. Blossier, Paris, France. Filed Feb. 20, 1902. Serial No. 94,903. (No specimens.)

Claim.—1. The process of manufacturing articles of rubber which consists in first softening the pure rubber, then thoroughly incorporating into the said rubber oxid of zinc and oxid of magnesium, in the proportion by weight of about eighty parts of oxid of zinc and forty parts of oxid of magnesium to one hundred parts of pure rubber, then preparing the mass for vulcanization, forming the mass into the desired shape and then vulcanizing the same, substantially as described.

713,752. Vehicle Hub and Spindle. Lucian D. Crandall, Springville, Utah. Filed April 8, 1902. Serial No. 101,875. (No model.)

Claim.—1. In a device of the class described, the combinaiton with a hub and a boxing therefor, of a spindle passing through the boxing, means for preventing displacement of the hub and boxing from the spindle, a cone on the spindle, and a cap on the hub which bears against the cone.

713,786. Metallic Vehicle Wheel. Thomas Midgley, Columbus, Ohio, assignor to the Midgley Manufacturing Company, Columbus, Ohio, a Corporation of Ohio. Filed Sept. 22, 1902. Serial No. 124,461. (No model.)

Claim.—1. A tubular metallic wheel spoke provided with a wedge shaped head having a transverse reinforce therein.

713,792. Explosive Engine. John A. Ostenberg, Westminster Station, Vt., assignor to Frederick M. Gilbert, Walpole, N. H. Filed June 1, 1897. Serial No. 638,941. (No model.)

Claim.—1. In a gas engine, the combination with the cylinder; of an explosion chamber smaller in diameter than the cylinder; an igniting device for exploding a charge admitted to said explosion chamber; an inlet port for the charge and an exhaust port for the products of combustion; means for opening both of said ports when the piston has reached substantially the end of its outstroke, and for closing the same during the instroke of the piston; a source of compressed explosive adapted to be admitted through said inlet upon the opening of the same, and a passage through the piston terminating in an injector nozzle in line with the axis of the cylinder and pointing toward the closed end thereof, whereby the charge admitted is injected in a jet through the spent charge toward the closed end of the cylinder and concentrated in the said explosion chamber, substantially as described.

713,793. Explosive Engine. John A. Ostenberg, San José, Cal., assignor to Frederick M. Gilbert, Walpole, N. H. Original application filed July 14, 1899. Serial No. 723,775. Divided and this application filed Jan. 21, 1901. Serial No. 44,120. (No model.)

Claim.—1. In an explosion engine, the combination with the cylinder of a jacket therefor; a tank of large area and relatively small capacity, the bottom of which is above the top of the cylinder; and communicating passages between said tank and said jacket arranged to set up a natural circulation, substantially as described.

713,855. Pneumatic Tire. George H. Clark, Boston, Mass., assignor to the Clark Cycle Tire Company, Portland, Me., a Corporation of Maine. Filed Oct. 25, 1899. Renewed Aug. 11, 1902. Serial No. 119,224. (No model.)

Claim.—A pneumatic wheel tire comprising a number of expansible layers and two non-extensible strips passing entirely around the tire lengthwise and disposed at opposite sides of the thread of the tire, outside of a diametrical line passing through the tire in parallelism with its axis, substantially as described.

713,860. Exhaust Valve for Internal Combustion Motors. William J. Crossley, Manchester, and James Atkinson, Marple, England. Filed Feb. 15, 1900. Serial No. 5,326. (No model.)

Claim.—1. In an internal combustion engine, in combination, an exhaust valve, a

Digitized by Google

piston attached to the exhaust valve, which valve is of somewhat greater diameter than said piston, a removable liner in which the piston works, gas tight, water inlets and outlets to the piston and valve, both of which latter are hollow and adapted to contain water, substantially as described.

713,917. Resilient Spring for Wheeled Vehicles. J hn F. Pope, Chicago, Ill. Filed July 13, 1901. Serial No. 68,241. (No model.)

Claim.—1. In a wheeled vehicle, the combination of veluted springs resiliently supporting a shaft incased in the hub of the vehicle, said shaft bearing or supporting the automobile or motor power of the vehicle, said shaft also bearing or supporting by connecting rods the propelling mechanism acted on by said motor power, said propelling mechanism consisting of revolving cog-wheels and shaft transmitting motion from the said motor power to the wheel of the vehicle, substantially as described.

713,937. Brake Mechanism for Motor Cars. Herbert Austin, Erdington, near Birmingham, England. Filed April 23, 1902. Serial No. 104,408. (No model.)

Claim.—Brake mechanism for a motor car, which comprises brake blocks of opposite sides of the car, a transverse spindle carried in fixed bearings of the car, arms at opposite ends, respectively, of such spindle, which carry the brake blocks, one of said arms being capable of turning upon the spindle and the other fixed thereto, two arms from such spindle, one forming an extension of the arm aforesaid which is capable of turning thereon and the other fixed to the spindle, a compensating lever pivoted at its centre to a part which is moved by the brake handle or motor to put on the brakes, and links connecting the opposite ends of this lever with the ends, respectively, of the second mentioned arms of the spindle, all substantially as set forth.

713,954. Vehicle Bell. John D. Caldwell, Vancouver, Canada. Filed Dec. 17, 1901. Serial No. 86,193. (No model.)

Claim.—1. In a combined speed indicator and alarm, a bracket pivotally attached to the frame of the vehicle adjacent to the tire of one of its wheels; a bell secured to such bracket; a flanged disk or pulley rotatably mounted in axial alinement with the bell, and adjacent to the striking edge; a spring controlled striker connected to the upper surface of the pulley and projecting within the bell; and means whereby the bracket may be moved on its pivot to bring the pulley into frictional contact with the tire or rim of the vehicle wheel in combination with independent means for bringing the striker into ringing contact with the bell, whereby the pulley is rotated and the striker impelled into ringing contact with the bell when a determined speed is attained; or an alarm sounded independently of the centrifugal force of the ringing device.

713,983. Carburetter for Explosive Engines. Lester E. Heath, Saratoga Springs, N. Y., assignor of one-half to Schuyler C. Brown, Saratoga Springs, N. Y. Filed Feb. 24, 1902. Serial No. 95,402. (No model.)

Claim.—1. In a device of the class specified, a box or casing having suction inlet valves for air and hydrocarbon and an outlet for the gas, a revoluble screen open at one end to permit the entrance thereinto of the mingled air and hydrocarbon, the gas outlet communicating with the space outside the screen, and a fan carried by and revoluble with said screen, substantially as specified.

713,998. Wheel. Henry D. Lefebvre, Alpena, Mich. Filed July 29, 1902. Serial No. 117,551. (No model.)

Claim.—1. A tire comprising similar spring members secured at their upper ends to a rim, the free end of each spring being provided with a recess and a projection, the projections on one section engaging the recess in the other, and a tread comprising a ring having edge flanges fitting over the outer ends of the spring members.

714,049. Sparker for Gas Engines. Louis B. Smyser, Newark, N. J., assignor to Ferdinand E. Canda, New York, N. Y. Filed Jan. 29, 1900. Serial No. 3,068. (No model.)

Claim.—1. In an igniter, the combination with a socket for an insulating bushing, and a two part insulating bushing therein having a longitudinal bore for the reception of an electrical conductor, the outer of the sections of said bushing having at its inner end a recess adapted to receive a head of such conductor, of a conductor fitting within said bore and having a head located within said recess, means for clamping the conductor to said outer section, and means for holding the sections of the bushing in place within said socket.

714,080. Exhaust Condenser for Explosive Motors or Engines. Robert Whitson, Auckland, New Zealand. Filed March 20, 1902. Serial No. 99,183. (No model.)

Claim.—In combination with a motor, a jacketed exhaust condenser, a pipe communication between the exhaust outlet of the motor and said condenser, an outlet pipe from the condenser, a discharge box having an opening in its upper portion through which the exhaust pipe of the condenser passes and projects downward into the interior thereof, a water pipe connection between the motor and the condenser jacket, a similar pipe connection between the condenser jacket and the discharge end of the exhaust pipe of the condenser, and an outlet leading from the discharge box at a point above the lower end of the condenser exhaust pipe, whereby the water in the discharge box normally seals said lower end of the condenser exhaust pipe, substantially as described.

714,084. Steam Boiler. William A. Woodeson, Gateshead, England, assignor to himself and Clarke, Chapman and Company, Limited, Gateshead, Durham County, England. Filed April 5, 1902. Serial No. 101,485. (No model.)

Claim.—1. In a water tube steam boiler, the combination of a furnace, a combustion chamber communicating therewith, a series of upright compartments surrounding said combustion chamber and connected alternately top and bottom, a communication between one of said compartments and the combustion chamber, another of said compartments having a smoke outlet, a bundle of water tubes within each of said compartments, water chambers communicating through said tubes, upper and lower tube plates respectively forming the tops and bottoms of the said compartments and the bottoms and tops of said water chambers, as set forth.

TRADE MARKS.

39,268. Certain Named Rubber Goods. Goodyear Rubber Company, New York, N. Y. Filed Oct. 20, 1902.

The word "Chauffeur." Used since October 11, 1902.

39,321. Explosive Gas Engines. John H. Cogswell, Havana, Ill. Filed Oct. 13, 1902.

The words "Red and Ready." Used since July 1, 1902.

39,264. Automobiles. Irvin D. Leugel, Reading, Penn. Filed September 30, 1902.

The word "Meteor." Used since January 17, 1902.

An Opening in Singapore.

Editor of the Motor World:

I trust you will succeed in inducing one of your manufacturers to send me a machine on consignment. I will take good care of it and remit promptly on sale. A French company has several machines here, and have sold three or four out of stock, one for the equivalent of $2,000 gold, to a rich Chinaman, and I understand they have twelve more coming out.

There is only one American machine that I know of in the immediate territory, a steamer, owned by some one up-country. One of the local engineering firms is importing parts of the Albion machine and setting them up here. They sold one the other day for the equivalent of $650 gold. It makes much less noise than the French machines, but is not as noiseless as some of ours. I think the French machines are petrol.

We can get benzine fairly cheap here—about 30 cents gold per gallon, and if it would do as well as gasolene, I should think a machine with the same kind of motor as used in some of the gasolene launches would be just the thing.

Electrical machines could not be used, as we have no public installation from which to draw supplies. Machines should cost from $600 to $900 gold, c. i. f. Singapore, allowing at least 20 per cent discount to be divided between broker and dealer. The Oldsmobile, Locomobile and Rambler are all neat types. A hood like the Spaulding has would go well out here, because rain showers are frequent. See what you can do to interest manufacturers of some simple and cheap machine, and I will do all I can to push it along and also to keep you posted.

The Sultan of Johore, who lives at Johore, fourteen miles from here, has a big machine which he bought in Europe for £1,500.

H. J. M. ELLIS, Singapore, S. S.

The Week's Exports.

Hamburg—4 cases auto vehicles and material, $895.

Liverpool—1 case auto vehicles, $1,035.

London—43 cases motor vehicles and parts, $8,125.

Rotterdam—3 cases motor vehicle parts, $120.

Fat Men Going the Pace.

"The two horsepower car contained four prominent members of the Guilford Fat Men's Club, and was travelling at the rate of three miles a minute," is alleged to be taken from the testimony in an English case for violation of the speed laws. But it must be received with more than one grain of salt.

One Man's Advice.

Car owners who make a practice of carrying a spare set of fully charged batteries should give these an occasional turn and a practice improves the batteries, prevents them from sulphating up and renders them easier and more economical to recharge.

INFORMATION WANTED

We want to learn all we can about the horseless carriages which were made in this country from eight to twenty five years ago. These old automobiles, even though they may have been in advance of the times, are legitimate parts of the history of the development of the automobile in the United States, and many of them, we believe, embodied characteristics of construction now in use, for which some one other than the true inventor is receiving credit. Address,

"HISTORY" care Motor World.

The WHITE Steam Carriage

AN AUTOMOBILE THOROUGHBRED.

In the 500-mile Reliability Contest from New York to Boston and return, arranged by the Automobile Club of America, three **WHITE STEAM STANHOPES** covered the distance without stop or trouble of any kind—a perfect performance.

The White Steam Generator is absolutely non-explosive, gives pressure in five minutes from cold water, and once in motion is self-regulating. In touring, the **WHITE** will make 100 miles without adding a drop of water or fuel to the original supply.

Write for full particulars, including Prof. Thurston's report on our steam generator, and the official reports of important endurance contests.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.

Volume V. New York, U. S. A., Thursday, December 4, 1902. No. 10

PRELIMINARIES WON

New York's Aldermanic Law Committee Will Reject Licensing Scheme and Favor Increasing Speed Limit to 10 Miles.

"No license for New York automobiles." A man about City Hall, who knows thoroughly what is going on, says that will be the verdict of the Law Committee of the Board of Aldermen, on the charitable and modest ordinance submitted by the Bright Boy of the League of American Wheelmen as it now is run. The informant of The Motor World said that he was in a position to say positively that the Law Committee would report adversely upon the ordinance offered by J. B. Thompson, who is now representative of the remnant of the great body of wheelmen that a few years ago fought successfully against being discriminated against by tax and license. The informant also repeated an opinion he had heard exprtssed about the wisdom of the mon who drew the ordinance, but that is another subject.

From the same source it is learned that the "rules of the road" ordinance for New York, which, as it stands, provides for a maximum speed of ten miles an hour in the city, will be reported to the Board of Aldermen favorably. There are to be no more hearings on it, and there is known to be a majority of the committee in whose hands it now is who are in favor of granting to New York, with its miles of country roads, a rate of speed two miles less than is allowed in London, where the traffic is much heavier than it is in the Empire City.

It is expected that the ordinance will be passed and then that tne same set of progress hinderers who have been stubbornly opposing it will go before Mayor Low, who runs a machine himself, and tell him that an automobile should not be allowed to travel any faster than a man can walk.

Receiver Appointed for Remington.

As a result of the proceedings brought against the Remington Automobile & Motor Co., Utica, N. Y., as noticed last week, L. N. Southworth has been appointed receiver of the company. He has been bonded in the sum of $10,000.

Judge Ray heard argument in the involuntary bankruptcy proceedings in the United States Court at Utica. The statements of various interested attorneys were to the effect that the company was organized under the laws of New Jersey, and that only 30 per cent of the capital stock had been paid in.

The case was brought up by George E. Dennison, attorney for the petitioning creditors, upon an order to show cause why the temporary injunction obtained a few days ago to restrain a sale should not be made permanent. John H. Grant, who appeared for a number of judgment creditors, opposed on the ground that only 30 per cent of the capital stock had been paid in and he did not want the court to restrain so that creditors could not bring suits to recover. He said the stockholders were liable only after judgments had been obtained against the company, and he asked to be allowed to proceed with the securing of the judgments. Charles G. Irish also objected to the continuation of the injunction.

The assets of the company are about $47,000 and the liabilities about $48,000.

Will Remove to New York.

The Post & Lester Co., the well known New England automobile supply house, will shortly leave Hartford and establish itself in New-York. Quarters in this city are now being sought, and the removal will probably be effected by the first of the year.

In confirming the report Mr. Post added suggestively:

"And we'll have goods in stock, too, so that people can get them when they call for them."

The Bateses Open in Boston.

Bates Brothers have opened a store at No. 145 Columbus avenue, Boston, Mass., and will handle the product of the St. Louis Motor Carriage Co. as a leader.

CLEMENT TO MANUFACTURE HERE

Famous French Maker has Option on Hartford Plant and is Himself Coming Over.

The only foreign makers who will directly exhibit their cars at the Madison Square Garden show are Clement & Co., of Paris. Immediately after the close of the Paris show they will forward the exhibit to this country. Mr. Clement himself will accompany the goods.

Back of this move are, however, intentions of much greater magnitude, nothing less, indeed, than the manufacture of Clement gasolene cars in America.

The matter has been definitely decided, and an option on a plant in Hartford, Conn., has been already secured. The Clement bicycle motor is being manufactured in that city, but the same factory will not be employed in the production of the cars.

W. G. Allen, of Hartford, is representing the Clement interests in this country, and is attending to the details of the project.

Willis Adds Automobiles.

E. J. Willis, who for many years has conducted one of the most aggressive cycle jobbing establishments in this city, has branched into the automobile trade, and promises to make himself felt. He has leased the building at No. 8 Park Place, where he will carry an extensive line of cars and automobile supplies of all kind

Fire Cripples Wheeler.

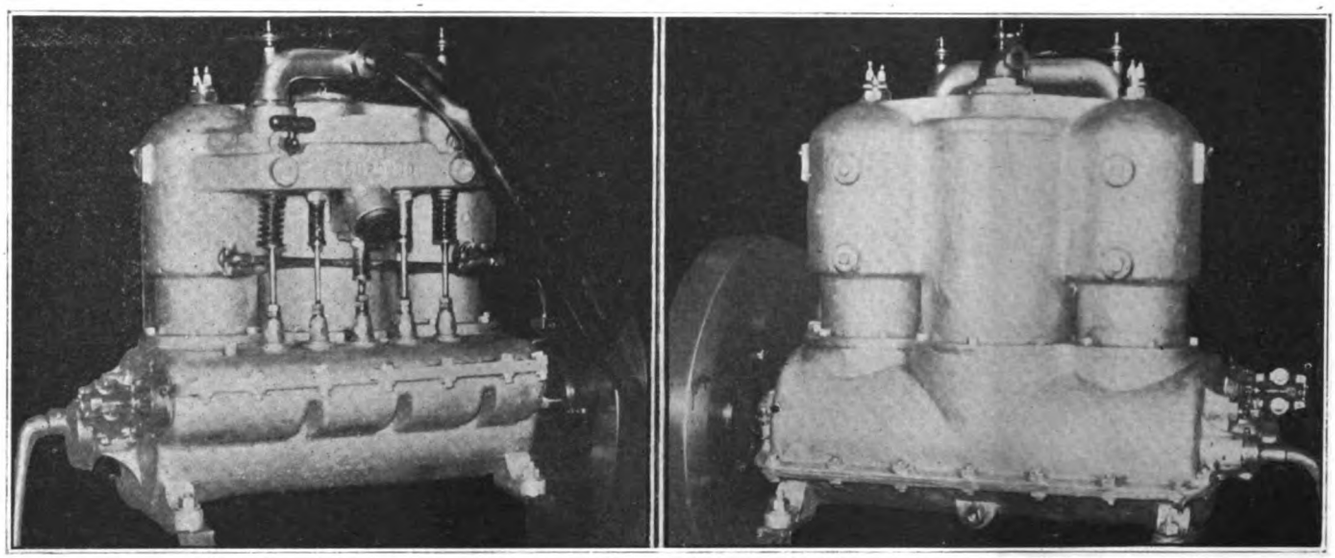
The plant of the Wheeler Mfg. Co., Detroit, Mich., which manufactures a number of automobile specialties, was partially destroyed by fire on the morning of November 26. A loss of about $15,000 was entailed, but the concern does not expect to be seriously interfered with.

Minneapolis's Newest Store.

The Pence Automobile Co., No. 836 Lumber Exchange, Minneapolis, Minn., is the latest addition to the Flour City's automobile contingent, a large store having been just opened by it. Henry E. Pence is in this city on business connected with the new concern.

Digitized by Google

UTILIZES THE EXHAUST



Here's a Remarkable Compound Gas Engine That Gives Every Evidence of Having Solved the Problem—Horse Power Increased Nearly One-third.

The gasolene motor being a heat engine, it has been the regret of many who have had its advance at heart that the heat units wasted in the direct exhaust could not be utilized to give power and to balance the uneven thrust on the crank shaft, much as is done on steam engines. Because of this there have been attempts at compound gas engines, but the long list of failures has raised a doubt hard to eradicate, and created a disbelief if not a positive faith that the thing cannot be done.

With a knowledge of this and influenced by it, a Motor World man, when invited to inspect a compound gasolene motor invented by Messrs. Graham & Fox, of this city, took the assignment confessing to much skepticism. The added confession should be made that where he went to scoff he remained to praise. Whatever had been the faults with other compound gas engines, faults which consigned them to scrap heaps and that have left a consequent impression, they were not verified in the Graham & Fox motor, even after extensive test and trial. It developed its power and did it with so quiet a running that it seemed little short of marvelous. It also made it easy to believe that a motor of this construction, but of smaller size, which is used on a vehicle claimed to have been run 18,000 miles, hardly required a muffler.

This quiet running was noted in two directions. First the motor was merely bolted to two 2-inch blocks, raising the motor about ten inches from the floor, and was only stayed in place by four small rods reaching to the floor. The lack of vibration made these all that was necessary to hold the motor in place. The second feature in this matter was that no muffler was used, the exhaust being piped out through a window. In the room the exhaust was not noticed. Wondering at this, the pipe was traced to its outlet, and here was heard a quiet puff, puff, in place of the usual staccato report which comes from non-muffled gas engines.

Of course, with so momentous a departure, details of construction became important. Unfortunately all of them cannot be given, owing to patent considerations. The motor shown has two explosive cylinders and one non-explosive cylinder, all in line, with latter placed between the former. This means that there are two high pressure and one low pressure cylinders. The former are water jacketed, the latter is not. The high pressure cylinders are 5x5 bore and stroke, the low pressure cylinder 7½-inch bore. All three cylinders, together with the valve housings and gas passages, are cast in one, there being no joints of any kind. There is, of course, but one exhaust opening. This is in the centre of the cross passage of the parts, and projects out and down to give a free exhaust. It is a feature of this exhaust opening that back of the diagonal stub pipe and forming part of it, is a box-shaped cavity, the purpose of which will be explained later.

The cylinders are bolted to the top half of the crank casing. This casing is in two parts, with the split on a diagonal line and running the length of the case An extension of the case incloses all the cams and gears, in keeping with the very latest construction. This, together with struts, give more than the average bearing surfaces. The crank pins for the high pressure cylinders are parallel, with the crankpin for the low pressure cylinder set at 180 degrees.

An examination of the front view of the motor will disclose five valve stems. The central stem is that of the exhaust puppet. The two outside stems are those which are known on the usual form cycle motor as the exhaust poppets. Between the two outside stems and the central exhaust stem are the stems of two other poppets. It is these two poppets which, in a large measure, mark the success of the inventors in overcoming previous failures in compounding gas motors. They are, however, only a part of the whole in this matter, there being other features, such as the proportion of the passages from the high pressure cylinder to the low pressure cylinder, which cannot be detailed at the present writing.

The action of the double high pressure exhaust poppets is interesting. The tuning of the outer valve is usual with that of the four cycle motor, but the tuning of the valve between this and the real exhaust valve is set so that it opens just before outer valve and closes exactly with it. During this time the central valve, the actual exhaust valve, is closed, so that the exploded gases pass to the low pressure cylinder, where they continue that explosion which in all other motors takes place, partly in the muffler, partly in the pipes and the balance out in the air. In none of which places is it effective, and in the case of the muffler setting up more or less back pressure against the motor itself.

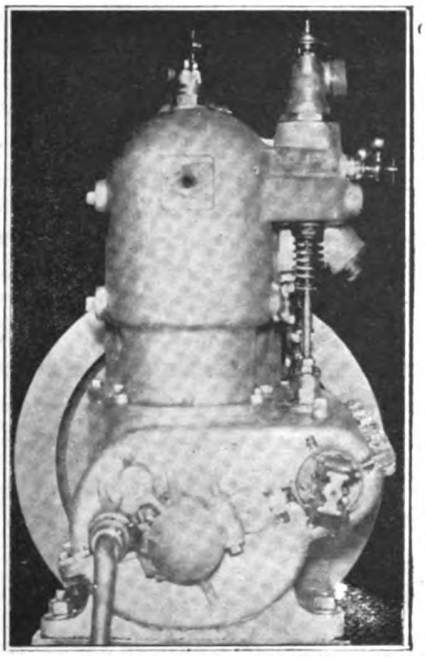
In addition to the recognition that the gas engine did not get all the power possible from the heat units generated by the firing, because the exploded charge was expelled at a high heat, it has also been appreciated that if a muffler of ample enough proportions could be built, to carry the charge until it was down to atmospheric temperature, then there would be no noise from the exhaust.

That is largely what taken place in the Graham & Fox compound motor. The centre cylinder in doing its work reduces the expansion to a point where the charge is at almost atmospheric pressure as it leaves the cylinder to pass into the final exhaust. Of course, it is of the highest importance that this reduction be not carried too far, and it is one of the features that assist in the so marked success of this motor, that

Digitized by Google

the proportions of this unjacketed low-pressure cylinder are understood to a nicety.

There was mentioned above, a boxlike back to the diagonal exhaust pope. The purposes of this are in keeping with the whole. This part of the exhaust passage has for its back the wall of the low pressure cylinder, and extending through it are slotted parts, as on a two-cycle motor, that are uncovered by the descent of the piston. In fact, this central cylinder is a two-cycle affair, refined by having the slotted parts and a poppet which lifts at every revolution of the crankshaft. That is, the central stem of the five works twice while each of the other two sets are working once. This combination gives instant clearance and prevents wire drawing, a fact which was amply proved from indicator card diagrams made from both high pressure cylinders and from the low pressure cylinder. The effect on the exhaust from the standpoint of noise has been mentioned. Running the motor for some time at over-speed proved that without a muffler the exhaust was as quiet as any muffler equipped vehicle that is met in a day's travels.



The inlet valves are in the position customary with automatic intakes, and are equipped to throttle or regulate the charge ofr varying speeds. Of course, in the vehicles with which this motor is to be equipped there will be change speed gears. But with so flexible a motor the inventors believe in using the gears less and the throttle more, thus doing away with one of the chiefest nuisances in too many vehicles of to-day; cutting out the motor every little while and changing the relation of the speed gears almost as often. The throttling is accomplished as follows: On each intake valve is a threaded disk, these disk being connected by a simple means. By rotating these disks the amount of gas admitted can be regulated by giving more or less drop to the inlet poppet.

The speed regulation of the motor being controlled by the inlet valve, the spark cam is made self regulating. To do this a ball governor is used. The cam which trips the contact blade is made so that it can slide back and forth on the shaft of the secondary tuning gear. This cam has an outer groove into which project fingers from the toggle arms of the governors. In its sliding engagement with the shaft the cam moves on a cam featherway. When the motor is running, the cam is held in proper sparking position by the governor.

Should there at any time be a tendency to race, the governor moves the cam outwardly on its spiral featherway, thus retarding the spark. As the motor comes down to normal speed the governor moves the cam back to correct position. Good sparking in the cylinder is taken care of by using the Roche two-pole plug.

After inspecting the principle of the motor it was of interest to know something about actual performance, and this was arrived at by using the prong brake. The first test was made with the motor compounded, using the three cylinders, two high pressure and one low pressure. Radius of brake, 46 inches. Revolutions per minute, 720. Pull on scales, 25 pounds. Giving a net of 13.1 horsepower. The second test was made with the low pressure cylinder cut out, so that the two high pressure cylinders only were doing the work. The revolutions were the same; the pull on the scales was 17 pounds. This gave a net of 8.9 horsepower. This showed a gain in power by the use of the low pressure cylinder of nearly 4.7 per cent., the consumption of fuel being the same in each test. The work done in moving the centre piston was shown by indicator cards to be offset by compression against this piston return stroke. It was negligible, being 1-150 horsepower.

It will be noted from the revolutions that

the motor was run at a comparatively slow speed. This, together with the unusual facilities offered by the makers for testing their claims, were matters that could not fail to impress the representative of this journal. Too often it has been found that horsepower claims were one thing, and inclination to furnish means to prove them another.

Careful examination of the motor in whole and in detail showed a well studied and designed piece of machinery, and only added to the favorable impression made by the tests. With these points in mind it is interesting to know the specific claims made by the inventors. In general, the points claimed are an engine of only three cylinders, two of which are explosive, giving an impulse on the crankshaft every half revolution, the same as a four-cylinder ordinary motor when each is an explosive cylinder. This latter is therefore considered in comparison in the following.

The simplifying of parts, as compared with an ordinary motor giving the same number of power impulses per revolution of crankshaft.

Gain in centre or low pressure cylinder from the following. Twice the number of impulses on one cylinder. A cylinder, with no spark plug or explosion impact; with no waste or clearance space; of comparatively even and without very high pressure at any part of stroke; in which an excess of lubricating oil can do no damage; without water jacket and consequent loss of heat; low pressure with two methods of exhaust, one of which is opened by piston at low point of stroke and the other, a poppet, opened at extreme top of cylinder, allowing all gases to exhaust as the piston passes upward, closing at upper end of stroke.

A piston which by its extra weight and number of impulses balances the two explosion pistons, which reciprocate in the opposite direction.

The comparison of fuel consumption has the following claims. Only two charges drawn into cylinders for every four impulses on crankshaft, as compared to four charges in ordinary type. The more perfect combustion of fuel on account of the additional time the charge is held confined by the centre cylinder. Exhausting the gases from centre cylinder to atmosphere at a pressure of only from 20 to 25 pounds, as compared to exhausting at from 60 to 80 pounds. The saving in loss of heat in cooling water on account of the absorption of heat by the expansion of charge in centre cylinder. The reduced necessity of muffling the exhaust because of the low pressure at which it is discharged from centre cylinder.

It is well known that the time of firing the charge of an explosion motor, as related to the movement of piston or revolution of crankshaft, varies directly as the speed. In the Graham & Fox compound, when the motor is running very slowly the contact by sparker is made when piston reaches the extreme upward end of stroke or when crank is passing centre. This point is, however, carried forward as speed of motor increases, and may reach 90 per cent. ahead of the one named above. This is accomplished automatically by the described ball governor and spiral cam, advancing the spark positively and in direct proportion to speed of motor.

Cooling water is saved, as only two cylinders require it. There is cooling of only one explosion per revolution of crankshaft, as compared to two. This allaws twice the length of time for the same number of heat units to be carried off.

Limiting the opening of the inlet valve, to control the speed, gives a saving in fuel in direct proportion to speed at which motor is run and consequent power developed.

Recent Incorporations.

New York, N. Y.—American Dry Battery Co., with $2,000 capital. Directors J. R. Colburn, L. A. Merrill and F. J. Byrne.

Portland, Me.—Baker Long Distance Auto. Co., with $150,000 capital. Incorporators—E. E. Baker, J. F. Fullam and L. H. Abrams.

For Sprinkling Reform.

There seems to be a suspicion in some quarters that salt must have been sprinkled on the tail of the Aldermanic bird, that he has been so tamely caught and tied to a perch on top of the Hildebrandt sprinkling cart.

Fie! Out upon the thought! Read on another page the lucid explanation of Alderman Mathews as to why his committee reported against permitting the Street Cleaning Department do the sprinkling and in favor of so arranging the matter that the present contractors might have the best chance of monopolizing Brooklyn and The Bronx, beside Manhattan. It was inspired by a sentiment of pue statesmanship, done to save the taxpayers' money. The "old way is the best," quoth Armitage. So thinks Mr. Hildebrandt, president of the Street Sprinkling Association, but he did not take the trouble to attend any of the public hearings and say so. As it now turns out, it was not necessary. How simple!

The explanation of Alderman Matthews does not explain a great deal. He is afraid that to have the city water all the streets would cost too much money, and that even if the money was appropriated, not all the streets would be sprinkled, and after all he thinks that all the streets do not need sprinkling. He objects to the clause which explicitly gives the advantage to the present contractors, but thinks that the bill is so drawn that the present contractors would have the advantage anyhow. Quite candid, that.

Concerning the fact that every class of road user supported the ordinance which his committee "turned down," Alderman Mathews says that they did so from selfish motives. Now, is that not strange! When a representative body of citizens—and those who supported the Oatman ordinance represented many thousands—go before their legislators and ask for enactments beneficial to them, and no one opposes, they are selfish.

The day is not yet lost to those who want clean, healthy and non-slippery streets. The Law Committee is not the whole Board of Aldermen. Many a bill recommended by it fails to pass. Neither is the board the chief executive. Mayor Low is an automobilist and a bicyclist. He knows from personal experience all about how sloppy and dangerous the asphalt is after the carts of the present sprinkling magnate have gone over it. The language of the ordinance that has been recommended for passage and the circumstances under which it was drafted by one of the Law Committee are—well, peculiar.

Let the automobilists and the other road users now get together for a final tug. Let the facts be known and the ordinance will not be signed. Probably it will not be passed.

A meeting of those interested has been called for Saturday night, at 310 West Firty-third street. Every association of road users should be represented. The automobile clubmen and the manufacturers surely should be on hand.

The Real Enthusiast.

Automobilists are divided into two classes—those who do and those who do not enjoy winter driving. The latter is much the larger body. Indeed, a very considerable number regard it with much the same feeling that the devil is said to entertain toward holy water. They see no pleasure in it, and rarely can be induced to undertake a drive of any length. To them from December until February is a closed season, a time when motors and motoring are dismissed from the mind and attention turned to other matters.

By the ardent winter driver this attitude is one attributable only to ignorance. No one can try a drive on a crisp, bright morning, with the thermometer well below the freezing point, without experiencing in fourfold force the joy of living. After the first few miles the blood begins to tingle and the whole body to glow with a warmth that seems to come as a retort to the challenge of the wind and the cold. How an automobilist can abstain from such pleasures, after they have once been tasted of, is almost inconceivable. Or so the winter enthusiast thinks.

As a matter of fact, it nearly all depends on the way the matter is approached. If one dresses properly, keeping the hands and feet well protected and the body thoroughly wrapped, and brings the requisite amount of courage to the start, so that the first shock will be met half way, it is long odds that pleasure, and not pain, will result.

It is a good deal like taking one's cold bath. It requires some nerve to make the plunge, but the result, the pleasureable glow that follows, is ample repayment.

So with winter motoring. To listen to a hardened all-the-year-around autoist dilate upon the fascinations of driving with the wind blowing a gale and the mercury haunting the bulb, is to stand a fine chance of becoming infected with his enthusiasm and of determining to test the matter for one's self.

Raising the Dust.

Why is the average car such a dust stirrer and scatterer, so much so that its occupants have to be protected in all sorts of ways against the enveloping clouds that penetrate everywhere? Many explanations of the phenomenon have been offered, but none of them seem to quite cover the matter.

Take a seat in a car and watch the wheels as they roll over the road, and you will see that it is not an easy question to answer. In the first place, as every one knows, most of the dust rises and follows in the wake of the car, and, as a matter of course, a car following on gets more of it than does the first car. Again, the big tires stir up the dust more than smaller ones; the speed is another factor, and the direction in which the exhaust is sent is sometimes still another. But it is not at all certain that the sum

Digitized by Google

total of these is sufficient to account for it all.

Bowling along a good macadam road, at the time rather dusty for want of rain, at a pace of fifteen miles or so, recently, it was seen that there were three distinct clouds of dust rising from the front wheels of the car. One came from behind the tread, the other two from the sides of the tire touching the ground. For a time the three clouds preserved their individuality; then they merged into one large and slowly rising cloud.

But even the occupants of the tonneau body, one of which the observer in this case happened to be, got very little of this dust—just enough to make it plain that there was dust about. The effect so far as the rear wheels were concerned could not be so plainly seen. The wheels themselves partly obscured the view. But the result seemed to be the same, except that the clouds coalesced sooner and then spread out more. Some fifteen or twenty feet behind the car there was a good sized cloud of dust, but scarcely any came into the car from the back of the tonneau.

There was none of the swirl of dust noticed in the case of cars going at high speed. It did not form the segment of a circle, starting from a point underneath the tonneau body and ending in the body itself, as it does in such cases. In fact, it really seemed as if the observer got more dust from the front wheels than from the rear ones.

About Engine Speeds.

It would take a bold prophet to champion the cause of the excessively high speed motors at this time. Engine speeds are decreasing, or perhaps it would be more accurate to say that a greater uniformity in the matter is obtaining and that the majority of cars are equipped with what are generally looked upon as moderate speed engines.

It is not meant, of course, that the high speed engine has passed away. Such is very far from being the case, and it is doubtful whether it ever will be. Motors of this type have a field, and the sphere of their influence is not likely to undergo any marked diminution. At the same time, the chance of its being widened is much more remote.

For more than a year the belief that the medium speed engine was the best for general service has been gaining ground.

The increased use made of it has tended to confirm that belief. Whether for single or multiple cylinders this holds true. Greater power and steadiness, less wear and tear on the parts, better lubrication—these are some of the advantages that follow in the train of engines of the class referred to.

Speeds of 800 to 1,200 revolutions per minute may be said to mark the extremes of what are now generally styled medium speed engines. While the term is a very elastic one, few will dissent from the expression, or do otherwise than hold engines which exceed or fall below this speed as high or low speed engines, respectively.

While uniformity is very far from being apparent—some say it is equally undesirable—in the majority of motor car details, there is some approach to it in this matter of engine speeds.

Not very long ago the most striking diversity of practice existed. Makers were groping for the best. But they did not all seek it in the same direction. They branched out, just as now they are uniting again. The belief in medium speeds is probably stronger than it ever was. At the rate things are going there will in a short time be practical unanimity among the great bulk of makers on this point.

Motor Vehicle Nomenclature.

The mutability of motor vehicle nomenclature has been frequently remarked upon, and ascribed to the extreme youth of the pastime. With maturity, it was expected, would come some approach to finality, and, by a process of elimination and addition the fittest would in the end survive and all else be cast out.

Within the last year, however, while there has been much shifting back and forth there has been little real settlement of the questions at issue.

Old terms are falling into disuse and new ones taking their place. But it frequently happens that just as we have about made up our minds that certain words have been definitely adopted others spring into popularity and oust their predecessors from their position. So the battle goes, and no man can tell what the outcome will be.

If we take first the very name of the motor vehicle, there is still very far from being unanimity on the subject. "Automobile" was at one time almost universal, and few persons would have ventured to predict its falling into desuetude. But to-day "car" is a term much more generally used, being applied not only to the big vehicles, but frequently to the runabouts and similar types.

Turning from the machine to the man, we find that "chauffeur" has in a few months undergone a transformation. Formerly it meant the operator or the driver of the car, and, by preference, the owner thereof, in contradistinction to the professional who was, with like unamimity, called the "mecanicien." Now owners fight shy of "chauffeur," preferring to be referred to as "drivers" or "operators." Consequently the "chauffeur" is usually, but not always, looked upon as the man engaged to look after the car, keep it in order, and, if necessary or desirable, drive it—a mechanic, in short. At the same time the French "mechanicien" is falling into disuse, and the distinction between him and the professional "chauffeur" is now seldom made.

In all this it must be admitted that we are but striving after terms concise, expressive and euphonious, something that, in short, "fills the bill."

It can scarcely be said that we have not succeeded even yet. We have tried foreign terms—mostly French—and, after extended use of them, have pretty nearly decided that we don't exactly like them. Hence we are ready to take up anything that promises to be an improvement, even although we may have some fear that the promise will not be quite fulfilled.

There is hope for those who howl about the noise and smell and smoke or steam of automobiles. The very latest thing in mufflers is the invention of a German artillery officer, who has arranged a combination of cylinders by means of which a heavy field piece, so it is said, can be discharged noiselessly and without a sign of flame or smoke being visible. Engine mufflers are down to a pretty fine point nowadays. In the future the ideas of the German genius may be made adaptable for muffling the noise of running gears, just to please the sensitive; but that will probably be when every road is made of boiler plate and every vehicle has rubber tires.

Here we are on the edge of another winter and yet no signs of the coming of the motor sleigh. Imagine the effect of the appearance of such a vehicle on Fifth avenue or Seventh avenue or in Central Park! Some one is wilfully throwing away a chance for columns of newspaper fame and portraiture.

One measure of a man's ability to become a practical automobilist is the length of time it takes him to find out when he's wrong.

THE AUTOMOBILE RECORD

Records of every sort were sent flying during 1902. Again and again the time for the mile has been lowered, both on track and road. There is not a single set of records in any class that have remained intact. A glance at the accompanying table will reveal that there are few records which do not bear the date of 1902. Those that do not are for the most part for the longer distances, while the others are more or less exceptional with regard to the style of vehicle and character of the course.

It is noteworthy that the new records presented are track records, most of them made by practical road vehicles, and not by specially contrived racing cars. While the record for the mile and the kilometre belong in France, practically all the track records belong in the United States. The foreign records were made on the road by racing cars. Another point to be noted is that the new records almost without exception have been made by American cars. All these facts are significant of the practical advance made by the automobile builders of the United States and the popularity of the sport.

It has been a good year for track racing, and there is hardly a course in the country suitable for the purpose on which a meet has not been held. Road contests, on the other hand, have been wanting, the sport in that direction having received a severe blow early in the year by reason of the accident on Staten Island on May 31. Had it not been for that lamentable affair it is undoubted that several other road contests of the sort would have been promoted, and it is probable that several other straightaway records would have stood to the credit of American machines. As it is, the best straightaway records here stand where they were in 1901.

In the absence of a racing board, to which are submitted certificates of accuracy concerning the timing, the course measurement and other details for approval and the authentication of such records, the sport has not yet arrived at a stage where the compilation of an entirely perfect table is possible. There is much to be desired in the way of completeness, owing to the failure in many cases to take the time of the intermediate miles, when a machine had made a new record for five or ten miles; also some difficulty is occasioned in preserving the classification of vehicles according to weight when records are made in a free for all race. An effort has been made by the Motor World

WORLD'S RECORDS.

GASOLENE, OVER 2,000 POUNDS.

Distance.	Time.	Made by.	Place.	Date.
1 mile....	.46	....Augieres	Dourdan, France.....	Nov. 11, 1902
1 kilo.....	.29	...."Augieres"	Dourdan, France.....	Nov. 17, 1902

Note.—A claim for 1 kilo in 28 1-5, made in England by Jarrott, August 22, 1902, is recognized by some, but not generally accepted, because of the course being slightly down hill.

AGAINST TIME.

50 miles...	1.17.50	....Alex. Winton.....	Chicago	Sept. 18, 1900

Note.—From six to ten miles, inclusive, the competition records for this class excel those made against time.

STEAM.

1 mile....	1.09 2-5.	...J. W. Howard....	Brighton Beach.....	Aug. 23, 1902
2 miles...	2.44 1-5.	...Rollin White.....	Cleveland	Sept. 16, 1902
3 miles...	4.03 2-5.	...Rollin White.....	Cleveland	Sept. 16, 1902
4 miles...	5.24	....Rollin White.....	Cleveland	Sept. 16, 1902
5 miles...	6.43	....Rollin White.....	Cleveland	Sept. 16, 1902

Note.—The best time ever made on a track by a steam vehicle is 1.05¼, made by G. C. Cannon at Brighton Beach, Aug. 23, 1902, but this is not allowed under the rules, because of two men being required to manage the machine. At Providence, Sept. 24, 1902, Cannon sent his machine five miles in the following time: 1.21½, 2.26¾, 3.41½, 4.54, 6.05.

ELECTRIC.

1 mile....	1.46	....A. L. Riker.....	Guttenberg	Aug. 18, 1900
2 miles...	3.37 2-5.	...W. C. Baker.....	Cleveland	Oct. 25, 1902
3 miles...	5.26	....W. C. Baker.....	Cleveland	Oct. 25, 1902
4 miles...	7.15	....W. C. Baker.....	Cleveland	Oct. 25, 1902
*5 miles...	9.05 1-5.	...W. C. Baker.....	Detroit	Oct. 25, 1902
6 miles...	10.56	....W. C. Baker.....	Detroit	Oct. 25, 1902
7 miles...	12.44 3-5.	...W. C. Baker.....	Detroit	Oct. 25, 1902
8 miles...	14.30	....W. C. Baker.....	Detroit	Oct. 25, 1902
9 miles...	16.14	....W. C. Baker.....	Detroit	Oct. 25, 1902
10 miles...	17.58	....W. C. Baker.....	Detroit	Oct. 25, 1902

*This record was made from a standing start. The next five miles (flying start) were covered in 8.52 4-5.

Race Promoters to Organize.

Before another racing season rolls around the West is likely to have an association of race meet promotors, designed to further the interests of the sport in that locality. Under the leadership of the Detroit Automobile Racing Association, with W. E. Metzger as the guiding spirit, steps are being taken to launch such an organization. Detroit, Cleveland, Cincinnati, St. Louis and Chicago are the cities most interested, and there is every probability that a plan acceptable to all will be proposed within a short time. In such case a racing circuit will be arranged, running through July and August, and meets will be conducted at convenient dates and free from confliction.

Col. Astor Offers $10,000.

Wealthy residents along the Hudson River are said to be ready to subscribe considerable sums toward the construction of a highway leading to the West. Among them is Col. J. J. Astor, who is quoted as offering his check for $10,000, if the road followed the west bank of the river as far as Rhinebeck.

Digitized by Google

,BLE BROUGHT UP TO DATE.

to give a correct list of the figures as they stand to date, but amendations or additions will be thankfully received.

All the records given are those made on a regularly measured track, except those sub-headed as road records. The fact that the competition set of figures make the biggest display is significant as showing the healthy tone of the sport. Most of the new records are made in short distance races against other vehicles of the same class. The cuts in the figures of 1901 are remarkable. The one-mile, for heavy gasolene cars, now 1:07 4-5, is a jump from 1:40. In middle weight gas cars the record last year was 1:51¾; now 1:19½. In light gasolenes the present record of 1:38¾ is a far cry from the 2:35 of 1901. In the case of steam vehicles, however, the tale is different. Oddly enough, in the steam class the competition track record of 1:39, made by T. E. Griffin in 1900, still stands. The closest approach to it is the 1:41 2-5 made by Dr. L. W. Sheppard at Chicago on October 18.

The history of the one mile and kilometre straightaway records for the year is interesting. Fournier's 0:51 4-5, made on the Coney Island Boulevard in the fall of 1901, withstood repeated assaults upon it for eight months until W. K. Vanderbilt, jr., on August 5, at Ablis, France, succeeded in lowering it to 48 2-5 seconds. At the same time he lowered Leon Serpollet's record of 29 4-5 seconds for the kilometre, made in April, to 29 2-5 seconds.

Then Fournier had to have a try to redeem himself, and on November 6 he went out on the road near Dourdan, France, and covered a measured mile in 47 2-5 seconds, beating Vanderbilt's time by just one second. Fournier also gathered in the kilometre record by one-fifth of a second, covering the distance in 29 1-5 seconds.

Fournier's triumph was of short life, for in less than a week a Paris merchant, who chose to operate under the pseudonym of M. Augieres, went out and made a mile in 46 seconds flat, and a few days later, November 17, he covered the kilometre in 29 seconds.

At the moment of writing, the latest piece of American record breaking comes over the wire from Detroit, saying that "Barney" Oldfield has lowered all of the track records from one mile to five, as shown by the table. The former records, made by Alexander Winton, were: 1:02, 2:12 1-5, 3:18 4-5, 4:25 and 5:30 3-5.

The steam record of 1.06, against time, made, or rather manufactured, by T. E. Griffin on September 18, 1900, which was accredited to him last year on his own representations, has been thrown out; information of a reliable character justifies its rejection.

IN COMPETITION.

GASOLENE, OVER 2,000 POUNDS.

Course for Bennett Cup Race.

The route of the 1903 Bennett Cup race is still undecided. The sub-committee appointed by the Automobile Club of Great Britain, which went to Ireland to look for a suitable course, has reported in favor of running the race in that country, but the Automobile Club of France is understood to have declined to accept it. In consequence there is talk of running it in conjunction with the Paris-Madrid race.

With regard to the proposed course in Ireland Count Zborowski and the secretary of the Automobile Club of Great Britain have discovered a circular route at about fifty-nine miles, which, although not ideal, would be quite practicable. A telegram has been received, however, from the Automobile Club of France to the effect that it could not agree to race over a course with such a short radius. Efforts will now be made to find a suitable road in Ireland ninety-four miles in length, as the rules provide that the race may be run backward and forward over a course of not less than that distance.

The British Automobile Club has decided to nominate two Napier automobiles out of the three representatives of England.

Commentary

Whenever the gentle theorist wants something for space filling he sets himself to work to reconstruct the ancient inns on a foundation of the trade automobiling will bring to them. The theory is fine; the facts are the reverse. Road houses first came into being when highways were used by travellers in stage coaches or on horseback. When railroads appeared some of the roadhouses went out of existence. When the suburban trolley lines gridironed the country the remaining ones faced the inevitable, and, facing it, most of them failed from lack of patrons. As the keeper of a roadhouse famous in the annals of old New York said to me on Sunday:

"Just as we were about giving up after the bicycle boom left us, road driving and equestrianism began to pick up, and I really thought the old business would keep me the balance of my life. I know better now. The automobiles have killed the roadhouse game deader than Adam. They go rushing by here all day long, and never one of them stops, unless it is to borrow a wrench or ask where gasolene can be bought. My former customers have either quit driving altogether or have sought the back roads or highways where neither the automobilists nor myself can find them. My lease expires next year, and down comes my sign. It has been hanging up there for three generations. This place had a great reputation. My father made money here, as did my grandfather before him. I am able to give better accommodations than either of them; but there is no trade to cater to. I am driven out of business by the automobile."

The man who told me this knew what he was talking about, and showed no prejudice in the telling. The fact that he had declined to renew his lease was a proof of his sincerity that not even I could doubt. Personally I believe the automobile will do more to close up roadhouses and alleged "inns" than it will do to open them, and, candidly, I don't think the closing of the majority of such places of entertainment will be altogether a thing to be sorry for, either.

* * *

The opinions of the motorphobes rest upon this very positive basis—that they adopt the mistakes of a few as evidence of the worthlessness of all.

* * *

It has pleased the daily papers to make a great hullaballoo over a waiter in the Balledoff winning an automobile which was raffled off in some sort of a charity bazaar or fair. But why? Surely, if any man can pay the repair bills for a church fair automobile that man is a Balledoff waiter! Then, again, there is a sort of eternal fitness in it all. Once in the hands of the storage and repair man the haughty waiter will then know what it is to be met by constant demands for money. Really, I'm glad the winner of the vehicle was a waiter, since his owning a church fair automobile is about the only chance any of us will ever have to get even with him. Just think of it! A fight out between a repair man and a waiter! It's rich!

* * *

Nothing is such an obstacle to production of excellence as the power of producing what is good with ease and rapidity. In the manufacturer's inability to turn out the perfect automobile in quantities to suit lies the brightest hopes of the trade's future.

* * *

With the near approach of the automobile show, it seems to me that something must have gone wrong over in Menlo Park, New Jersey. I have watched the daily papers closely for the spread eagle, scare headed stories about that wonderful storage battery, but not a line have I seen. This silence is ominous; it is not according to precedent, the almanac, Hoyle or the ethics of press bureauism. Wonder what the matter can be?

* * *

The lone oyster of the church fair stew will please go drown himself. There was a day when the oyster was the whole thing in church entertainments, but, like many another, he must now make way for his betters. Enter the automobile! Not in the soup, of course, but in the game of church entertainment, wherein profit is sought to be derived from those entertained. The new church game which is now all the rage is "Around the World in Automobiles." The way this coin capturing game is played is this: First get your automobiles, borrowing them if you can, hiring them only after all other efforts fail. The church is, for the purpose of the game, "the grand central station," and the houses of the parishioners who promote the affair become the various "countries" to be visited. Each house is arranged to represent a different country, and the inmates are appropriately costumed for the parts they play. The automobiles start from the church and visit each house, or "country," in turn, those making the tour paying the promoters a set price for the trip. So successful has this game become in up to date church circles in the East and West that the fair, the donation party and other such archaic coin catchers are temporarily in disrepute.

* * *

Did you ever notice that with the exception of ourselves no one ever runs an automobile just at it should be run?

* * *

The effort to start a rival automobile club here in New York is still progressing—on paper. I am not prepared to say there is not room for such an organization, though I am free to confess my hearing is not acute enough for me to be able to declare there is a crying need for anything of the kind. But until you can extract moonbeams from cucumbers I shall be inclined to doubt the ultimate success of an association the prime mover in whose organization is an individual expelled from the present club for good and sufficient reasons. It would be the part of wisdom if those favoring the formation of the new club were to at once announce that the individual who is now foremost in shouting for it is not to be the standard by which its future membership is to be judged, otherwise the class who would ask to become members would not compare at all favorably with those of the Automobile Club of America, whose mistakes, be they what they may, have never been in the direction of a low standard of eligibility where the requirements of membership were under consideration.

* * *

Reference to the club promoter in the foregoing reminds me that he has on hand besides this club scheme an automobile paper to appear daily during the time the show is on at Madison Square Garden. Just how such a sheet will succeed when the management of the show has announced that no automobile publications are to be allowed to purchase space in the show because the proprietors of the papers "annoy the trade with them" remains to be seen. Perhaps, though, a gentleman nominally high in the trade, who is currently reported to be "backing" the weakly end of the daily scheme, is counted upon to exert sufficient influence in favor of his partner's publications to accord them privileges denied to other and more reputable periodicals. To any one who has watched how this alleged backer has used his office and position for the benefit of his partner and his paper anything he might do in the present instance would occasion no surprise.

* * *

That a horseless carriage should be the father of a noiseless cannon does not at first sight seem natural, yet such is the case. Colonel Humbert has succeeded in applying the principle of the muffler to a French field gun, with the result that the flash, noise and smoke of the piece are practically done away with. How the glory of war is passing! Imagine the field battery of the future going into action, a horseless, flashes, smokeless, noiseless, death dealing mass of complicated machinery, with nothing to commend it save its speed and its secrecy! Could anything be more awful or less encouraging to those who "would seek glory at the cannon's mouth"?

* * *

The French are still debating over the gender of the automobile. To settle all arguments of every kind, why not declare that the automobile is IT, and let that slangy expression of a palpable fact end the matter?

* * *

Necessity is called the mother of invention, but in the case of the motor vehicle inventor it is very often the cruel mother of fairy tales.

* * *

Already automobiling has an oversupply of average vehicles.

HILL CLIMB UNSATISFACTORY

Eagle Rock Affair a Dreary, Drawn-Out Event Ending in Error and Dispute.

Only by a narrow margin was the second annual hill climbing contest of the Automobile Club of New Jersey, which took place on Thanksgiving Day, saved from being a fizzle. Pretty nearly everything seemed to militate against its success. The weather was about as bad as it could be, local officials with itching palms delayed and otherwise aggravated matters, and difficulty in getting the timing apparatus working combined to come perilously near to putting the finishing touches on the event. By dint of strenuous exertions, however, the obstacles were all cleared away finally, and the contesting vehicles made to complete their tasks.

Three days of rain preceded the day set for the contest, and a drizzle prevailed during a good part of Thursday morning. With midday, however, came a change. The clouds broke away and the sun shone forth at intervals with frequent retirements, as if abashed, however.

SUGGESTS A FIRE BUT IS MERELY "STEAMERS" EXHAUSTING.

CROSSING THE TAPE AT STARTING POINT

PLANK (OLDSMOBILE) ROUNDING THE LAST TURN.

ON THE STEEPEST GRADE.

The sun had little power, and the only change that took place in the road's surface was a change from a semi-liquid covering to a thick paste that was but little improvement. It was nearly an inch thick, and the wheels of the vehicles adhered to it almost as if it had been cement. Steam was devoured at a prodigious rate, while the gasolene cars had troubles of their own in consequence of the unusual road friction. A single look at the road was all that was needed to make it plain that broken records were the last thing to expect.

Scheduled to begin at 10 o'clock, it was not until nearly two hours and a half later that the first car was started on its journey.

Digitized by Google

Although but little more than a dozen cars came to the starting point, in lieu of the thirty-one entrants, it was not until about 2 o'clock that the last one had completed the ascent.

In arranging for the contest the Automobile Club of New Jersey had reckoned without the Mayor of West Orange. That self-sufficient functionary was on his dignity, and he intimated very plainly that he had to be seen, in more than one sense, before the show could go on. Consequently Chairman W. J. Stewart had to come to terms with him, with the result that the West Orange police force, consisting of two officers, was placed on guard on the hill—at the club's expense. Then, and then only, the embargo was lifted.

It took more than an hour to arrange this little matter. Meanwhile there had been some delay in getting the time apparatus, the Mors device, with Secretary Butler in charge, having been loaned by the Automobile Club of America, in working order.

The vehicles were limited to one trial each, but were given plenty of time to get ready. No restrictions were placed on them in the matter of starting, and most of the operators took a long start, coming to the tape at the foot of the hill at full speed. Several hundred spectators had gathered to witness the sport, and they were spread over the length of the hill, the largest groups being at the bottom and top. A few of the cars made abortive attempts to ascend the hill, and one, a vehicle equipped with a kerosene burner, caught fire about a third of the way up and burned for about ten minutes, but without causing any material damage

The first car to start was No. 9, a Toledo steamer, but as the starting time was not received at the finishing point the trial went for naught, and the operator, Angus Sinclair, declined to make another attempt. The second car was even more unfortunate, for it was the one that caught fire. It also failed to reach the top of the hill and be timed. The following cars were more fortunate, and matters went smoothly thereafter. W. J. Stewart's No. 13 upset preconceived notions by making the best time in its class, 2:58¾, and, as it proved, the best of the day. O. P. Nestman's Stevens-Duryea was at first credited with having covered the distance in 2:45, within three seconds of the best time of last year and much faster than any gasolene car had made the climb. Subsequently, however, it was given out that a mistake had been made, and the corrected time of 3:45 substituted.

Some little excitement was created by the action in this case. Nestman claims that he carried a watch as he went up the hill, and is confident that 2:45 was the right time. He avers his willingness to equal this time, and to run the contest over again, or a new one, to prove that his claim is well founded. The Motor World man was at the steepest portion of the hill as Nestman came up, and noticed that he was coming at a good speed —much faster than any of the other gasolene cars.

According to the report submitted by S. M. Butler, the official timer, he is convinced that the time first given out, 2:45, is a mistake, due to the fact that it fell to him to both manipulate the instrument and read the times. On other occasions there have always been two men allotted to these duties. Three watches are said to have shown the time to be in the neighborhood of four minutes instead of three, and in view of these facts the change of time was made.

To a Motor World man on Tuesday W. J. Stewart stated that he was convinced that the time made was 3:45. But, he added, he was willing to accede to Nestman's request and have another contest up the hill on any terms suggested by the latter.

The results, corrected and officially given out, follow:

STEAM CLASS.

Time.	Operator and make.	H.P.	Wgt.
2:58¾	—W. J. Stewart, Locomobile.	4½	750
3:08	—E. P. Washburn, Mobile...	4½	750
3:36¾	—W. J. Stewart, Locomobile.	4½	750
3:43¼	—H. M. Wells, Prescott.....	4½	900

GASOLENE CLASS.

3:45	—Otto Nestman, Stevens-Duryea..	8	1,050
4:26	—Dr. H. Power, Duryea....	6	900
4.49¾	—J. D. Dale, Long Distance..	7	1,400
4:52¾	—C. E. Proctor, Winton....	15	2,000
5:20	—H. M. Odiorne, Long Distance	7	1,400
6:06	—I. D. Plank, Oldsmobile...	4	800
7:15	—L. J. Wyckoff, Knox.....	8	1,400

The Searchmont
"America's Leading Automobile"

THREE SEARCHMONTS were entered in the 100 Mile Non-Stop Endurance Contest of the Long Island Automobile Club, April 26, 1902. All made a perfect record of 100 per cent. without a stop.

THREE SEARCHMONTS were entered in the 100 Mile Non-Stop Endurance Contest of the Automobile Club of America, May 30, 1902. All made a perfect score of 100 per cent. without a stop.

THREE SEARCHMONTS were entered in the 500 Mile Reliability Contest of the Automobile Club of America, Oct. 9 to 15, 1902. All made a perfect record of 100 per cent. without a penalized stop, and EACH was awarded a GOLD MEDAL.

A postal will bring you our illustrated catalog.

NO REFORM IN SPRINKLING

Despite United Opposition, Aldermen Favor Present System—Matthews's "Explanation."

Our City Fathers—take off your hats to them—or at least that portion of the august body known as the Law Committee, have decided that the united sentiment of the automobilists in New York amounts to nothing, that the protests of the bicyclists, the truck drivers, cabmen, pleasure drivers and the Commissioner of the Department of Street Cleaning, all combined, are too trifling to be considered, and the committee has reported against the street sprinkling ordinance which all those mentioned have earnestly advocated.

More than that, the committee has reported in favor of the slick little substitute bill drawn up by Alderman Marks, under which Mr. Hildebrandt and his Street Sprinkling Association will not be confined to Manhattan, but will have all the other boroughs of the city opened up for him and his pretty use of the people's water for the benefit of such portion of the people as choose to "ante up" to him for it.

The Sprinkling Association is a concern incorporated in West Virginia with $700 capital, and its plan of operation is to pay the city $28,000 a year for the exclusive right to use as much of the city's water as it pleases and to sprinkle when and where it pleases. It derives its revenue from the tenants along the different streets it sprinkles. Where no one pays, there is no sprinkling.

The Oatman ordinance ousted the Hildebrandt gang and placed the matter in the control of the Street Cleaning Department.

Alderman Armitage Matthews, who is chairman of the Law Committee, was called upon by a representative of The Motor World and asked what were the considerations which induced the committee to take the course it did. He said that the Oatman ordinance involved the expenditure of too much money. Beside, he thought that for sprinkling all the streets the estimate of Commissioner Woodbury was much too low; beside, the estimate did not include Brooklyn, and all the Brooklyn members were against the ordinance; beside, he thought that after all the present plan was the best one, because if the city undertook to sprinkle it could not do it all, and there would be a howl from every place that was not watered."

"But, Mr. Matthews, might not a contractor neglect to sprinkle and cause a howl, and would it not be better for the blame to rest squarely on the head of a department than to have him dodging behind a contractor?"

"Not if the proper sort of a contract is made. It is the lookout of the borough president to see that he has his contractor properly bound to do the work and under bonds. Most of the city's work is better done by contract."

"What about the clause in the ordinance which provides that only those who have had experience in street cleaning may bid for the borough contracts? That lets in as practically the only eligible party the very corporation that has been so long complained about, and rather smacks of a 'nigger in the woodpile,' doesn't it?"

"I didn't like that part of the ordinance myself. I didn't like that."

"If you did not like it why did you not vote against it?"

"Well, I am not taking the political view of it, but only considering what is best for the city. I do not think there is any nigger in it, and anyway the man with the plant, you know, would underbid the man who would have to buy one, so it would amount to the same thing. I did not like that part of the bill, but then there are other sprinkling plants beside the one working here. There is a contractor in Queens that I know. He could bid."

"What about the charge that under the present plan of sprinkling the contractor uses more water than what he pays the city for?"

"I do not know that it is so, but if so it is the city's lookout. If you can get two pounds of coffee for the price of one you're going to take it, aren't you? The city should see that the price paid is compensatory and hold the contractor to his letter. If he doesn't do as he should the city should be able to tmake him do it."

"I suppose, Alderman, that in this age of politics it is utopian to believe that for the sake of health and safety to street traffic and cleanliness the streets should be washed and cleaned, whatever the cost?"

"Well, if there is a great amount of money to be spent there are too many ways in which it is needed more. There is Bellevue Hospital, a disgrace. If $650,000 were spent on it it would be better than putting it into street sprinkling. The trouble is the people want money spent all the time and are not willing to let us get the revenue. Now look at that tunnel proposition——"

Here the Alderman digressed at length about the Pennsylvania tunnel scheme.

"One more question, Alderman. How did your committee dispose of the consideration of all the sentiment in favor of the Oatman ordinance that was represented by the various bodies of road users who advocated the passage of the Oatman ordinance and the fact that there was not a particle of opposition?"

"Oh, all those people are speaking selfishly and without regard to cost. They are speaking for themselves. The automobilists say their tires skid and the cyclists say something else."

"But bicycle tires skid the same as automobile tires, and the rider is more apt to fall."

"Do they? Well, the automobilists are not so urgent about the sprinkling. As I understand it, they would rather that the streets should be left dry and kept clean."

OLDFIELD GETS THE MILE

After Two Failures he Betters Winton's Record and Makes new Figures up to Five Miles.

World's track records against time, from one to five miles, inclusive, were established at Detroit on Monday. The Grosse Pointe track was the scene of the onslaught, and "Barney" Oldfield, driving the Ford racing car belonging to Thomas Cooper, was the record breaker.

Two five-mile trials were made. In the first one the times for each mile was as follows: 1.03 3-5, 2.08 1-5, 3.12, 4.14 4-5, 5.21. On the second trial the time by miles was as follows: 1.01 2-5, 2.05 1-5, 3.11 1-5, 4.15 2-5, 5.20, lowering the five-mile record eight seconds.

A third trial was started, ten miles being aimed at, but after going one mile in 1.01 1-5, world's record, the sun had thawed the track and made it slippery, and the trial was relinquished.

The trials were official and were made under the auspices of the Detroit Automobile Racing Association. There were four timers and two scorers present.

On the previous Saturday Oldfield had made an unofficial trial, with such excellent results that the later attack, with a regular corps of officials, followed. The time selected for the Saturday trial was early in the morning, before the sun had a chance to thaw the surface of the track. In a three-mile trial he covered one mile in 1.02 flat, but that was unofficial.

As he started upon this trial a fine snow commenced to fall, and in a moment the course was too slippery to permit him to come inside any record. This time the first mile, which was also the last, was done in 1.05. As he entered the turn from the backstretch of the second mile the powerful and heavy car slewed around, and before it could be straightened away had turned around three times, and when stopped was headed for the training stables. The remarkable nerve exhibited by Oldfield in driving the Ford-Cooper racer was commented upon by all who witnessed the attempt.

The following were present at Saturday's trial: W. E. Metzger, Jackson Brady, W. C. Rands, Jno. P. Schneider, Wm. Newman, Robt. Hartnell, Tom Cooper, John Colquhann, Ed. McNess and Ned Brodwell, of Detroit; W. E. Wheeler, of Minneapolis, and E. P. Brinegar, of San Francisco.

To Protest Aldermanic Decision.

A call has been sent out to all interested in the abatement of the street sprinkling nuisance in New York to meet on Saturday night, December 6, at 310 West Fifty-third street, near Eighth avenue. The "joker" ordinance approved by the lawyers of the Board of Aldermen may yet be headed off if those who have hitherto championed the cause will stick together and let the facts be known. No self-respecting Mayor is likely to sign such a bill under such conditions.

LICENSE HEARING TAME

Only the Man Who Drafted the Law Spoke in its Favor—Opposition Riddled it.

Even the principals seemed to have a suspicion that the hearing on the bill to license the operators of automobiles, now before the Board of Aldermen, this city, which took place on Friday last, was of a perfunctory nature. There was talk for and against it, but no one took it seriously or seemed to think that it had any chance of passing; not even its author, one Thompson, who made a long speech defending it from the ridicule that had been cast upon it.

Although ample notice of the hearing had been given, the number of those attending it did not exceed a dozen, all told. These comprised President Shattuck and Secretary Butler, of the Automobile Club of America; President Oatman, of the Associated Cycling Clubs; Attorney W. W. Niles, of the A. C. A. and the N. A. A. M., and J. B. Thompson, who drafted the measure.

With a copy of the ordinance and a memorandum before him, President Shattuck, who was the first speaker recognized by Chairman Mathews, began a criticism of the measure. He characterized it as an abortive and ridiculous ordinance, and proceeded to point out some of its weaknesses and inconsistencies.

"It is charity to suppose," he said, "that the author of the measure was merely ignorant when he provided that all lamps carried on automobiles should be brought before the Mayor for inspection before being used. The Mayor has his hands pretty nearly full now. As to the provision that metal signs, containing numbers one-half inch in height be placed on each lamp, it is equally absurd. No one could possibly read such signs on moving automobiles. On cabs and hacks, where such numbers must be carried, the idea is that they shall be examined in case of dispute about the fare, the vehicle meanwhile being at a standstill.

"The measure provides that $10 shall be charged as a license fee. That is, in my opinion, entirely too much."

"Do you object to a licensing scheme on general principles, Mr. Shattuck?" asked Chairman Mathews.

"The club has already appointed a committee to look into this and other matters, and at the meeting of the Legislature in January a bill will be introduced relating to the regulation of automobile traffic in this State, and containing a licensing plan. We are in favor of license; but we think the licensing should be done by the State and be uniform."

"Why are motor cycles excepted in this ordinance? I should dislike just as much to be killed by one of them as by an automobile. I have never been killed by either, but I feel that this would be so," concluded Mr. Shattuck, smilingly.

As the legal adviser of the club, W. W. Niles spoke next, but very briefly.

"The Board of Aldermen has no power except such as is expressly conferred on it by the body which created it, in this case the State Legislature," he said. "No power to compel automobilists to take out licenses is conferred in the city charter; consequently the board has no legal right to pass this ordinance. In the second place, the Legislature has expressly forbidden any municipal body to make such a regulation," referring to the well known section of the Doughty bill, which reads:

"Any person owning or operating an automobile or motor vehicle, whether the motive power of the same be electricity, steam, gasolene or other source of energy, except such as are used for public hacks, trucks or vehicles for hire, shall not be required to obtain any license or permit pursuant to the provisions of any local or municipal resolution or ordinance, or the rules or regulations of any commissioners, trustees, supervisors or other authorities having charge or control of any highway, public street, parkway, driveway or place, or pursuant to the provisions of any municipal charter or any other statute, except as herein contained."

On behalf of the Associated Cycling Clubs of New York, President Oatman protested against the passage of the ordinance. "Cyclists have known in the past what it is to have to be licensed to ride their wheels," he said, "and they do not want such things revived in the case of automobiles."

The field was now leftt clear for the defenders of the ordinance, and J. B. Thompson took upon himself the task of combatting the arguments that had been presented. In a tone so low as to be almost inaudible, and which was but slightly raised in response to a request to speak louder, he defended the proposed ordinance. Almost at the outset he was put on the defensive by being asked if he rode a motor bicycle and had, for that reason, excepted them and motor tricycles from the provisions of the ordinance.

"No, I do not ride one," he replied. "But I think they are different from automobiles and should be governed by different regulations."

Pressed for a clearer definition of the difference, he admitted his inability to give it, but insisted that there was a difference.

"Are you going to surrender your power to the Legislature," he asked, plainly glad to get away from the motor bicycle subject, "the inherent power to regulate the traffic in your own streets?"

"The power is already taken from us," interjected Chairman Mathews. "The same body that conferred it has taken it away."

Proceeding, Thompson asserted that the amended charter superseded the Doughty bill, and that there was no law to prevent municipal bodies from passing regulations to govern their own streeet traffic. The license was not for income, but to control operators, and it mattered little what the fee was so long as control was given by power to revoke the license.

"Millionaires can go on killing people and paying $25 and $50 fines indefinitely," he continued, ignoring the fact that imprisonment is provided for a second offense.

"It would be much better for this club, which has made such protestations of a wish to stop the abuses complained of, to come forward with suggestions to improve this ordinance than to criticise it," he said. "I do not claim that it is perfect. But it is drawn so it can be interpreted in a broad and liberal spirit. If things in it are wrong they can be amended. We do not say that licenses must be revoked for offenses committed. This is left to the discretion of the officers entrusted with the enforcement of the ordinance."

Quoting from figures alleged to have been compiled of accidents caused by automobiles, a prodigiously large total was cited by Thompson. Pressed later by The Motor World man regarding these figures, it came out that they had been prepared by a person the mention of whose name would alone cause them to be viewed with suspicion.

A protest from the N. Y. Physicians' Association, levelled at the $10 license fee, which was characterized as being too high, had been received, Chairman Mathews stated.

No one caring to speak further, the hearing was declared closed.

Berg's 24 Models.

No expense is being spared by the Berg Automobile Co., No. 100 Broadway, New York, to turn out the finest car that skill and experience can produce. Designed on the most approved lines, it will really be an improved or 1903 Panhard, the exhaustive study of the best types of French gasolene cars made by Hart O. Berg during his long stay in Paris being reflected in it. There will be two styles, with two and four cylinders, respectively. The cars are being constructed by the Berg company in a portion of the factory of the Cleveland Machine Screw Co., and a considerable number of the parts are being imported. No less than twenty-four styles of bodies will be furnished, the object being to give each purchaser what will be practically a made to order vehicle.

One Estimate of Oldsmobiles.

He is the manager of a considerable automobile establishment in a considerable New England city, and he was not talking for publication; for that reason it would be unfair to use his name, but what he said shows the esteem in which the Oldsmobile is held.

"We are handling the —— (mentioning four well known cars), and have handled the —— (mentioning three others), and if we had to choose between them," he said, "we would drop them all for the Oldsmobile, so highly do we prize the agency. And the vehicle itself is as good as the agency. There are people who 'knock' it, but let me tell you that there is no vehicle that is giving less trouble or more satisfaction. As we have sold about 200 of them, I think I ought to know."

TROUBLES AND REFORMS

The Former Concern Several French Makers, the Latter the Racing Rules.

French Bureau Motor World,
2 Rue d'Abbeville.

Paris, Nov. 21.—There are rumors that things are not going on so well as they should do with a certain number of automobile firms who are in rather a big way of business, and it is hinted that if they are still able to keep going with an appearance of prosperity it is solely on account of the large amount of capital at their back. Nothing is positively known about the position of these companies, because the balance sheets are never published, and as the stock is in the hands of private holders they do not go gadding about affairs which they say concern only themselves. It is therefore impossible to say exactly what is the situation of the companies whose names are often referred to deprecatingly in automobile circles in Paris. Those professing to be in the know declare that these concerns are on the down grade, and are seeing their working capital diminish in a way that is likely to have unpleasant consequences in the early future. There is no doubt a good deal of exaggeration in these rumors, but as there is said to be no smoke without fire it is very probable that there is some foundation of truth in these statements.

One thing is certain, the manufacturers referred to are making considerable efforts to find a market for their vehicles. This contrasts somewhat strongly with the situation of certain other concerns who sell their vehicles before they are made, and have, therefore, not to worry themselves about disposing of cars in stock. This is simply because they have a reputation, which the others are lacking. In the motor car industry it is useless to expect to build up a permanent business by commercial methods, which usually consist in thrusting goods down the public's throat. Not only must a vehicle fail to become a success, unless it is designed and built to stand hard usage, to which it is put, but the people who buy cars are able to make their own selection, and will only content themselves with the best that can be obtained. They have learned that in automobiles, more than in anything else, the costliest is invariably the best, and that a low priced car, unless it is of good construction, is more expensive than well tried vehicles for which high figures have to be paid. A maker, for instance, who seeks to turn out cars as cheaply as possible and in the greatest number cannot build such satisfactory vehicles as the manufacturer who conscientiously puts the best workmanship and material into every part of the mechanism. Such a car is cheap because the higher initial cost means very little expense for subsequent maintenance; whereas, a vehicle which is merely knocked together by workmen who are inadequately paid for piecework costs more in the long run, owing to the heavy upkeep, to say nothing of the trouble and annoyance to the user. This is the sole reason why some makers fail, and others get practically a monopoly of the business. Some people who have gone into the industry have yet to learn that the motor vehicle demands the highest mechanical and technical skill. Nothing in the way of slipshod work can be permitted, and the firms who turn out cars as they would any other piece of machinery are those who make a reputation and secure the bulk of the trade.

Once a new development in construction has passed through the experimental stage and comes to be regarded as a necessary step toward the perfection of the motor vehicle all the makers are naturally anxious to adopt it; and just now the attention of manufacturers is directed to the suppression of the top speed reducing gear, so that the drive is taken direct from the motor shaft to the counter shaft, or rear axle, as the case may be. The system has, of course, always proved satisfactory for light vehicles, though up till recently only a few makers have made a special feature of this mechanism; but it was long doubted whether it would prove equally satisfactory for big cars. The Mors Company have shown the possibilities of the system by employing it on their new cars, apparently with satisfactory results.

It is naturally impossible to say to what extent the direct drive is responsible for the higher speeds attained by the big Mors vehicles, but the fact of the adoption of the new gear coinciding with these phenomenal speeds suggests that the direct drive effects a decided economy in the transmission of power. In big cars, however, it is still a question whether the direct drive is an advantage except on vehicles built for very high speeds, and for touring cars the majority of users seem to prefer the ordinary system of reducing gear. In the light carriages the conditions are not the same, as owing to the lower power of the motor it is necessary to economize power in every possible way, and the effort being much less considerable than in the big cars the gear is not subjected to a high strain when driven direct, as in the heavy cars. The system has proved so uniformly successful in light carriages and voiturettes that it seems likely to come into almost general use. Quite a number of firms are making a special point of the direct drive in their light vehicles, and this will be one of the features of the forthcoming Show, and as one change usually brings about another, so the direct drive on the top speed is being accompanied by the adoption of the shaft transmission, which greatly simplifies matters when there is no necessity for an intermediate gear.

The Automobile Club of France is carrying out important changes in the racing regulations which are likely to add greatly to the interest of future contests, at the same time that they will undoubtedly give more satisfaction to the majority of manufacturers. Until now the vehicles have been divided into different categories, and there has only been one winning car in each class, but in future each maker will be required to run a number of vehicles, probably four, and the results will be calculated according to their aggregate performances. Thus, if all four cars of the same make and type complete the course the times will be added, and it is upon these aggregate totals that the results will be based. Individual performances will count for little. Supposing some of the cars fail to complete the course the times will be taken for each car up to the control beyond which they stop, and from that point they will be penalized for the remaining distance, that is to say, if they stop 100 kilometres from the end of the journey the distance will be calculated at, say, ten kilometres an hour, and thus ten hours will be added to the official time taken at the control where the car broke down. The results will therefore be based upon the fastest aggregate times of the different teams, and the distances they cover, so that the races will in future be in every respect contests of reliability. The driver of a car arriving first in a race will, as usual, get covered with glory, but this can only be regarded as an honorary victory, since unless the other cars of the same make and type do well the team may be beaten by another which finish the course in a better aggregate time. The race will, of course, lose none of its sporting character, but it has been found necessary to draw up these new regulations, as it is clear that speed is only an evidence of progress when it is accompanied by reliability, and thus speed and reliability are twin factors which will be taken into account in future contests.

The last record attempt on the official route at Dourdan was accomplished by Augières on his Mors, when he covered the kilometre in 29 seconds, which beats the record held by Fournier by one-fifth second. It is probable that this is the last record run of the season, for the Prefect of the Department has just intimated that these "race meetings" must cease. As is usually the case, automobilists have perhaps been trespassing too much upon the tolerance of the authorities, who were disposed to say nothing so long as the record spins were merely isolated attempts, but during the past few weeks some dozens of cars have been at Dourdan every day waiting for a favorable opportunity to beat records, and as they took entire possession of the road the Prefect apparently thinks that they have gone a little too far. It is suggested that the Automobile Club should purchase a private road traversing the forest parallel to the public highway and similar to it in every respect, except that the surface will have to be remade. This, however, is only a small matter for such a rich body as the A. C. F., and it is hoped that before long we shall have a private official track where automobilists will be able to go for the records without let or hindrance.

HUNTING FOR EAGLE ROCK

How the New York Reporters Reached the Hill and the "Fun" They Had.

By special invitation from E. B. Gallaher, the new general manager of the Mobile Co. of America, the press representatives made the trip from New York to the scene of the climb in two Mobile wagonettes. The start was made from in front of the Motor World offices, under cloudy skies, at 8.30 a. m. Accompanying the wagonettes were two runabouts that were entered for the contest, one of them having a kerosene burner that it was desired to test.

The route lay across the Desbrosses street ferry to Jersey City, then over the old plank road to Newark; thence to Brick Church and out to the hill.

Such a ride as it was! One wagonette had six passengers and the other three, until one of the six deserted. There was a forlorn ignorance on the part of all as to the route, although a couple of the daily paper representatives had written detailed descriptions of it. The consequence was there was a ridiculous amount of inquiring done all the way. The notoriously vile plank road was in a more deplorable condition than ever, if that be possible, and, being soggy from the rain, was on its worst behavior. The mud and water splashed up in inky sheets from between the loose planks until it seemed as if the machines were running through a field of young mud geysers.

At a place where a janitor was flushing the walk with a hose both machines stopped for water, and there one man thought he would be foxy by shifting from the heavier carriage to the lighter one, believing it had a better chance to make time. A mile beyond this the heavyweight wagonette came to grief. A stop had to be made to tinker with the gasolene feed valve. The wind was bitterly chill, and to make matters worse it began to rain. There was no sheltering refuge at hand, and the passengers had to sit there and take the gibes of the passing truckmen and pedlers, who cried: "Get er hoss!" Three stops of this sort were made of varying duration. On one occasion the pilgrims got a meed of satisfaction by finding a truck with one wheel stuck in a rut. The mobilists in a chorus yelled, "Get an automobile!" but were charitable enough to put their hands to the spokes and help twist the wheel out of the hole.

The destination finally was reached, and as the hill climb was late the belated party was on time, but folks along the route must have thought that there were a lot of people from New York out in automobiles on Thanksgiving Day looking for Eagle Rock, because each of the four carriages made inquiry as to direction about once every half mile.

The trouble with the delayed carriage was a trivial one, and the other three went through the mud and wind and rain without a hitch, and all were thankful for the courtesy of the Mobile company.

Is Storage Profitable?

"'So-and-So,' seems to be doing well with his garage, as I notice it is filled with cars on storage," remarked a visitor to the manager of one of the biggest automobile stations in New York City.

"No, he isn't. He's losing money. There is not a storage shop in town that makes money. There is absolutely nothing in the storage game. Rents are too high and monthly rates too low. You cannot make a place pay unless you are selling all the time. We have demonstrated that."

"But," said the surprised visitor, "the demand for storage warehouses is increasing with the selling, and there has got to be a number of them. Is that not so?"

"Yes, but the prices have got to go up. They are far, far too low. Hire a decent place in the centre of the uptown district, where you can do good business, a place big enough to put two dozen machines on the floor, and your rent will be almost or quite as much as what you can get for storage at the prevailing rates. I tell you, prices in the business are too low all around. It's an expensive game at present, and no effort should be made to cheapen it until later, when everything has become more nearly standardized. You not that several makers have raised their prices for next year. Well, they have got to go higher up. You may take this as only one man's opinion, but mark the prediction."

Inserting Water Gauge Glasses.

To put in a new water gauge glass of the ordinary type first remove the broken glass and take off the packing nuts. The india rubber rings which form the water-tight joint must be removed, and, if damaged, replaced. The packing nuts should be put on the new glass, open ends outwards, and the packing rings slipped on to the ends of the glass, which should then be placed in position. Screw up the packing nuts carefully. The automatic check valves will be down on their seats, and must be released. To do this screw down the small hand wheel above each valve three or four complete turns, which will release the valve. Unscrew the hand wheel to its original position. If the gauge glass is put in while the boiler is under steam release the lower check valve first to admit water. Steam is liable to crack a new glass.

Iron vs. Air Tires.

Experiments made by M. Michelin show that 2.29 horsepower is required to propel a vehicle one ton in weight at a speed of ten miles an hour with iron tires. With pneumatics the same conditions require 1.72 horsepower. Solid rubber tires are not dealt with in this experiment, but by taking a line through other results they appear to lie between the two, somewhere about 1.5 horsepower. The tractive resistance of solids, taking pneumatics as 100, is 129.8.

Y HIS HEART JUMPED

The Optical Delusion That Caused an Operator to Think His End Had Come.

"After an experience I had last week I feel pretty sure that there is nothing the matter with my heart," remarked an autoist to the Motor World man. "Had it not been perfectly sound I am very much afraid I should not be here to tell the tale.

"I was making a little tour through New England, and we were going along at a moderate pace, the road not being particularly good. Going through a patch of woods I thought I heard a locomotive whistle, but did not pay very much attention to it at the time. A hundred yards or so further on we emerged from the woods and swung around a slight turn and up a sharp, short grade. At its summit a sight met my eye that sent my heart, in spite of its soundness, into my mouth.

"Right in front of our car, so close that we were within half a dozen feet by the time I was able to realize it, was a railroad track. And about twenty yards up that track was a freight train, coming directly toward us.

"It seemed too late to stop, and yet equally impossible to get clear of the tracks before the locomotive reached us. For an instant I hesitated, hand waiting on brain, the latter debating whether to reverse and clap on the brakes or to give her full speed ahead and try to clear. It probably took but an infinitesimal part of a second, and I was already putting the latter expedient into effect when I saw what lifted the cyclopean weight that was pressing upon my brain and benumbing my faculties. The train was sheering away to the left, instead of plunging through at me!

"The explanation was very simple. The track we were by this time crossing formed one arm of a Y, while the main line, on which the train was running, formed the other arm.

"Seemingly aiming straight at us, the train, therefore, swung to our left, instead of to our right. Thereby it saved our lives, I do believe. Either the front or the rear of our car would have been struck had the train passed over our part of the Y. I leaned back in my seat, feeling queer qualms at the pit of my stomach. 'A bit too close for comfort,' was the remark I made to my companion. He assented. He looked a trifle blue about the gills, I thought."

Denaturizing Alcohol.

The denaturization of alcohol is accomplished by mixing with the spirit a small proportion of some foreign substance, which, while not injuring its efficiency for technical uses, renders it unfit for consumption as a beverage. The denaturizing substances employed depend upon the use to which the alcohol is to be subsequently applied. They include pyridin, picolin, benzol, toluol and xylol, wood vinegar and several other similar products.

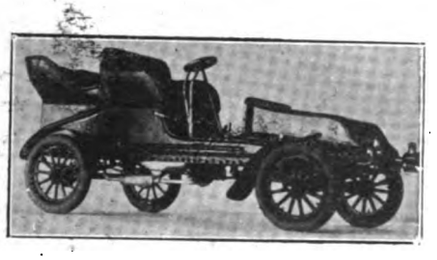
WHEN THE CAR SKIDS

Exactly What Happens, the Causes Thereof and the Available Remedies for the Sideslips.

A skilful driver is in touch with his car; he can feel every movement, every tendency to swerve; as a rule the car gives him ample warning of its troubles with the road surface. If he fails to take note of these warnings by reducing his pace and keeping an absolutely steady track, then he may come to grief. It is this intimate approchement between the care and its driver which is the essence of a successful and secure chauffeurship; without it one is in the same predicament as a man without knowledge of riding who is on a mettlesome horse; he does not know what will happen next.

Side slip is mostly governed by known laws, and generally happens under one or another of the following circumstances: If the road be greasy and the car travelling at a good speed the driver attempts to change his course, and does this too abruptly. Owing to the state of the road the guiding wheels fail to grip the surface—they slide or skate—the driver thus loses control of the steering—the body of the car or centre of gravity pursues the general course that the driver tried to deflect; the front wheels being, so to speak, pushed aside and the centre of gravity acting as a sort of pivot on which the car turns, and this pivot continues its straight course, affected a little by the varying degrees of greasiness of the road. On a piece of ice of even surface the pivot or centre of gravity would continue its course in an absolutely straight line.



The other conditions causing side slip are when the two driving wheels are in contact each with a road surface of different degrees of gripping quality. The wheel which has a firm grip drives the car, while the opposite wheel merely turns in the mud. This produces a side thrust, which, if not counteracted by the front wheels, will turn the car round. Should the front wheels be on dry and level ground, the course of the car is kept, in spite of the slipping of one of the driving wheels. Should this condition arise on an upgrade the car will become, as it were, restive and difficult to steer, the reason of this being that most of the weight is off the front wheels. Consequently these have little control of the ground, and the back driving wheel, which is working on a good gripping surface, twists the car in the direction it wills.

The remedies for side slip therefore are: Never abruptly change the course of a car on a slippery road. In meeting or overtaking an obstacle begin to change your course very gradually, and long before you reach the obstruction throw out your clutch and apply your side brakes slowly and feelingly, releasing them immediately a tendency to independence comes over the steering.

The countershaft brake should only be applied in an emergency, as it may lock one wheel and allow the other to turn. It only acts through the differentials. In ascending a greasy hill where the road surface is greasy in patches, as described, climb at the very slowest pace that is felt to be safe.

Dr. Brandow's 3-Pound Winton.

In addition to his professional capacity, Dr. Frank H. Brandow, president of the Berkshire Automobile Club, of Pittsfield, Mass., possesses mechanical ability of no mean order, and when early last summer he stated to the members of the organization, that being dissatisfied with the motor vehicles turned out by the different manufacturers, he proposed to build one that would eclipse all others, considerable curiosity was excited. Last week he announced that it was completed and invited a few of his intimate friends to the workshop in the rear of his residence, where, mounted on a pedestal, was disclosed the doctor's ideal—a miniature reproduction of the Winton touring

car, weighing about three pounds, 12 inches in length and perfect in every part.

The machine was built by Dr. Brandow during the last few months from drawings made by Louis E. Laflin, of Chicago and Pittsfield, and is an exact counterpart of the latter's racing automobile. All of the fine details were carried out, including levers, brakes, steering gear, throttle, spark advancer, etc. The upholstering of the cushions and seats is unusually rich and handsome, and the brass work is prominent, including the side lamps, which are gold plated. The body of the carriage is a rich maroon, with dark striping and a highly polished finish. Considerable difficulty was experienced in getting tires for the wheels, but this was finally made possible, a special set being made to order.

This little Winton is not Dr. Brandow's first effort. He had previously made miniature models of the famous locomotive, "999." the City of Paris and City of Berlin, ocean steamships, all of which were built from drawings of the originals.

Some drivers are so optimistic that when their ears tell them that there is something wrong with their cars they keep on, hoping that the trouble will disappear. Sometimes this does happen, but very rarely. The rule is for matters to get worse instead of better. A little investigation and a few minutes spent in adjusting or tightening or cleaning will sometimes save a lot of time and money in the end.

WINTER CARE OF TIRES

When Long out of use or Seldom Used What may be Done to Prevent Deterioration.

With the oncoming of winter many autoists wonder how tires should be treated to insure them against deterioration. If the car is run but seldom it is a good plan to jack it up so that the wheels do not support its weight, and the fabric liners are not continuously under stress. Four wooden tripods, shaped at their apices to take the front and rear axles at points close up to the wheels, are the simplest and least expensive means of doing this. It is not necessary to deflate the tires.

When the car is out of use for several months before storing the car it is advisable to take down the tires and make a careful examination of the covers, inner tubes and rims. If the first named two require repair of any description this opportunity should be seized for having the work properly done. With regard to the rims, remove the protective band if there is one, and revolve the wheel slowly in search of places where the overturned edges may have flattened, and test them all round with the thumb to see whether or not the edges have grown sharp and cutting. In the first case, bend up the overturned edge with a pair of strong pliers, and round off the cutting edges by means of a file.

In nearly every instance it will be found that the rims are rusted, and rust exerts a very evil effect upon the fabric in the tire, for it causes it to rot. In this case rub the interior of the rim, and particularly the surfaces of the overturned edge, carefully with emery paper, removing all traces of rust, then coat with two coats of white lead paint, finishing with one of varnish. The covers and inner tubes should be carefully wrapped up in paper, and placed in a cool place away from the sunlight.

If so wished the tires may be replaced on the rims, but if this be done the car should, of course, be jacked up off the ground and the wheels well protected with the cover of the vehicle to shield them from the light.

When the Engine is Over-oiled.

When an engine has been overoiled and the plug is found to be sooted badly in consequence, it is desirable not only to clean the plug before replacing it, but also to rinse out the cylinder with some kerosene. With many cars this can be done from the kerosene pump on the dashboard. In others which do not possess this convenience it is often possible to pour some into the cylinder. If kerosene is not available gasolene may be used. A few turns of the starting handle can then be given so as to spread the cleansing fluid over the interior of the cylinder.

Regarding Lubrication.

The value of any liquid for lubrication depends to a great extent on what is known as its viscosity. This is a property by which the liquid resists alteration of shape. It is not the same as cohesion; this latter resists the pulling apart of the molecules composing the liquid, while viscosity opposes their flow relative to each other.

This ability to resist flow is very necessary, or otherwise the lubricant would too readily squeeze or thin itself out, and thus let the surfaces come into contact—the thing to be avoided; also it would feed too fast if it were too thin, or had too little body, as the phrase goes. A simple illustration may be observed by dropping onto a smooth plate small quantities of water, olive oil, castor oil and molasses. The water immediately diffuses itself over the plate, the other liquids taking much longer time, in the order named.

It is not merely the viscosity of a liquid, however, which determines its value for lubricating purposes, but rather a property which may be called oiliness or greasiness in the case of solids such as butter, tallow, etc. This property it is that enables the liquid to maintain a film of appreciable thickness under pressure. One can readily see that a liquid may be very sluggish in flowing and yet have but little if any permanent body. Glycerine, for example, is more viscous—has more body—than lard oil. If a quantity of the former were dropped onto a smooth plate, and another plate quickly brought in contact with it, the glycerine would oppose quite a resistance to flowing out, much more than the oil; but in the end it would do so more completely and thus fail to leave as thick a film between the surfaces as would the lard oil.

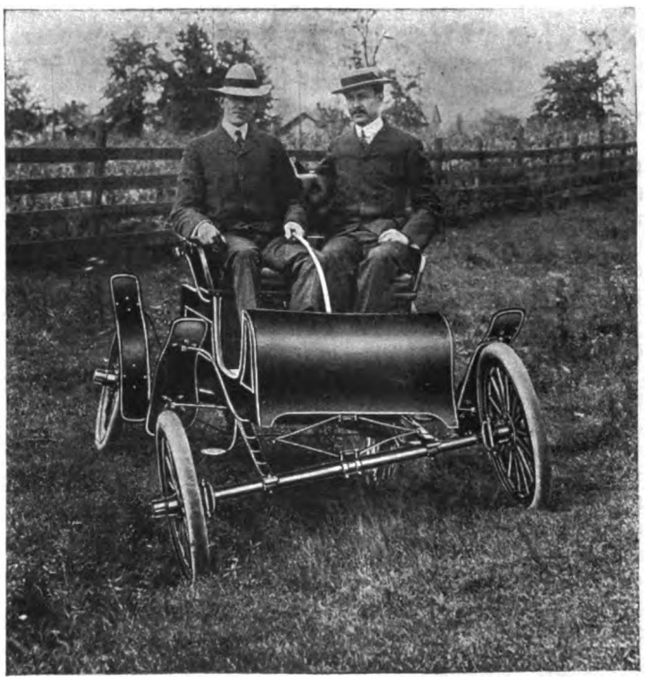
This inability to stand up permanently against a high pressure is the item that makes it less valuable as a lubricant than lard oil; besides, it would not feed as freely through wicks, etc. Water placed on a clean surface quickly spreads all over it. Kerosene does the same to a somewhat less degree; neither, however, is able to maintain a film of any appreciable thickness under pressure. To realize this, wet the thumb and finger with one of these fluids and rub them together forcibly. There will soon be experienced a certain resistance to the motion. This frictional resistance is due to the fact that the fingers have come almost perfectly into contact and the friction has become "solid" rather than "fluid."

When, however, a more fatty oil is employed (lard, rape, etc.), or butter, the substance will not squeeze out so thoroughly, the flesh does not come into actual contact, the resistance to motion is less, and it is said that the substance is greasy, or, as above stated, has the property of greasiness or oiliness.

The viscosity of an oil or grease changes with temperature. With a rise of temperature the lubricant achieves the power of flowing more easily; that is, it gets "thinner" or has less body. This important consideration demands that the nature of the lubricant be changed according to the seasons, which is, accordingly, done, a thinner oil being used in winter than in summer.

Castor oil is an admirable lubricant when the conditions permit; that is, in a temperate climate, and on very heavy machinery where the pressures are high. It can also be used for lighter pressures when the temperature is high, as in southern countries. Here the heat thins it down sufficiently to feed well, and it is accordingly much employed for locomotive and other light uses, being mixed with a proportion of mineral oil.

Also when the engines or machinery run in very hot sheds or engine houses, an oil of considerable viscosity may be adopted, the extreme heat thinning it down when in the bearings, to a required degree. As regards the effect of temperature, testing plants have shown that its influence on the frictional resistance of the bearings is considerable. The higher the temperature, the less the frictional resistance; this has been attributed both to the decreasing viscosity of the oil and also to the bearing expanding more rapidly in diameter than the journal.



When Fuel is Wanted in France.

A timely hint to autoists travelling in France is to ask for "essence" when desiring to replenish the stock of gasolene. The average Frenchman would not know what "gasolene" meant, while if the English term, "petrol," was used there would be danger of getting kerosene.

About Alcohol.

Theoretically, alcohol has only three-fifths of the thermal value of petroleum, but it has been found that for motor purposes 28 per cent of the theoretic energy of alcohol can be utilized against a maximum of 15 per cent in case of petroleum and its products. This advantage in favor of alcohol is still further increased by an admixture of 16 per cent of benzol. Another important advantage of alcohol, which applies specially to its use in motor carriages and in engines for small manufacturing plants in premises adjacent to dwellings, is its absolute cleanliness and freedom from the mephitic odors which render hydrocarbon engines so offensive to many people.

Cutting Across a Detroit Lot.

Messrs. Barbour Demonstrating the Flexibility of the Northern Running Gear.

How he Boomed the Battery.

He was new to the game, and, as he put it, was determined to get acquainted with everybody right away. In that laudable endeavor he had paid several visits to the dispensary of liquid refreshments at the corner, while waiting for the Eagle Rock contest to get under way, and he was very "mellow."

"Let me give you some of our circulars," he would begin, whether to a newcomer or one he had already delivered himself it made little difference. "We have the best battery there is in the world. We are determined that every automobilist in the land shall know of its transcendent merits, and are taking this method of bringing it to your attention. Just read these circulars over, and if you want to try our goods bring them along and they will secure you special prices at our headquarters. Now, don't think they are no good, for they are, and I tell you so."

WHY "MIXTURES" VARY

Some of the Causes Affecting the Explosive Charge and how They may be Overcome.

While perfect ignition apparatus has much to do with the proper working of gasolene motors, it should never be forgotten that the explosive charge is worth study and attention. The conditions involved are correct mixture or proportion of gas and air; proper compression of the charge; purity of the compressed charge—that is, there should be as nearly as possible a complete expulsion of the residue, or burnt gases, of the former charge, in combination with a full new charge of fresh mixture; complete combustion of the charges in combination with rapid expansion, that there shall be a resultant fall in temperature and a maximum utilization of heat in performing work.

The correct mixture of air with vapor or gas can only be approximately expressed because of the variable nature of the conditions as to temperature of the atmosphere, nature or quality of the gas or vapor, number of atmospheres of compression and the means used for inflaming that compression.

With ordinary coal gas the mean figures for proper mixture are 8 parts of air to 1 part of gas, while for the richer vapor coming from gasolene the means are 10 to 1, but the explosive limits cover a wide range of proportions. That is, there may be as rich a mixture of gasolene as 4 to 1, or as thin a mixture as 14 to 1, and yet there can be explosions. While these are the generally accepted figures, the exact proportion, however, is of little practical value in handling vehicles, or more correctly speaking, the conditions vary so much that a proportion cannot be arbitrarily laid down, but must be determined by experimenting if the very best results are aimed at.

For example, in starting a motor in cold weather the charge must be very rich in vapor at first, but after the motor becomes heated the quantity of gasolene can be reduced with advantage. On warm days the proportions will always be wider apart, particularly when starting. Other conditions exist which make it essential that the mixture shall be variable from time to time and under direct control of the driver. For these reasons an owner who desires to always get the best results, most power at the expense of the least gasolene, should study his motor under varying weather conditions and varying mixture proportions, and note results. A few trials will fix them in mind for use at all times.

In starting the motor with the compression cock open, the suction stroke of the piston draws in air through the cock in addition to that in the mixed charge from the carburetter. This naturally impoverishes the mixture and it becomes more certainly explosive when an extra admission of vapor can be given at the carburetter. After the cock is closed the conditions are again altered and demand a readjustment of the proportions.

This is no doubt the reason that causes many motors to misfire after closing the cock. That the misfiring comes from closing the cock rather more than from the first opening is undoubtedly due to an almost invariable tendency toward feeding the motor with a too rich mixture in order to insure a start. Then the closing of the compression cock and the heat generated by the first explosions calls for a greater percentage of air, and unless this is understood and attended to at once there comes the trouble in getting the vehicle going. This is particularly true in warm weather.

This condition calls attention to the claims of those who use the exhaust valve lifter to relieve the compression in starting. With this device the compression cock is not used, and consequently the mixture remains uniform all through the process of starting. It is only necessary to find a mixture which is explosive and then the ratio does not have to be immediately altered. It is nearly constant, being only influenced to the small extent due to the heating of the cylinder and the variations of the atmosphere. These are both so gradual that ample warning is given to make the necessary changes in the gasolene feed.

Another condition which no doubt has a distinct effect on the explosive mixture is the proportion of burnt gases or products of combustion remaining in the cylinder or in the combustion chamber from the previous power stroke. Although motors vary considerably in design in relation to the comparative areas of the cylinder and the combustion chamber, it is manifestly impossible with present construction to entirely expel the products of combustion. And such remnants of a former charge must act as an adulterant to the incoming charge, if there takes place any real mixture of the two. As to the latter point, however, there would seem to be no conclusive evidence or agreement. Some experts assert that a partial mixture takes place, while others are of the opinion that the residue of the exploded gases is drawn down bodily by the suction stroke of the piston, so leaving the combustion chamber and upper part of the cylinder to be filled with a fresh explosive mixture which lies on top of the exploded gases.

It is possible that what really does take place is a compromise in which the central body of the unexpelled burnt gases descends with the piston with the walls of the cylinder head and combustion chamber holding a part and the remnant of that body being held up in the top of the combustion chamber by the inrush of the new charge. In this case it is most likely that the fouling of the charge will be in the cavity around the spark plug—that is, in such motors where the plug is screwed into the side chamber out of line with the cylinder bore.

If this is the case, then there is good reason in the suggestion that the plug should be screwed into the combustion chamber at the central head in place of the side extension for the passages, and that in either case the points of the plug should be extended further in than is at present the general rule, that the spark may be insured to take place in the fresh mixture. From the testimony of those who have tried the latter, it would seem that the theory of the bodily drawing down of the exploded charge is disproved.

The proper working of the valves of course greatly influences the question of the quality of the explosive mixture. With the automatic inlet valve in perfect working order, and other conditions corresponding, the maximum amount of new mixture will be drawn in at each suction stroke of the piston. But if the inlet valve spring be too stiff, thus diminishing the amount of mixture taken in, in conjunction with a too short period of opening of the exhaust valve, then the power stroke will be weak and inefficient by reason of the curtailed supply of explosive vapor due to the first condition, and the excess of unexpelled products of combustion due to the exhaust valve closing too soon and so setting up a certain degree of compression on the exhaust stroke.

Causes of Poor Compression.

Bad compression is indicated by the motor running poorly and giving but little power. It generally results from badly seated valves, worn piston rings, or bad joints. To test the compression leave the compression tap or release closed, the valve lifter down, or whatever means are adopted for relieving compression for starting purposes out of action. Take the starting handle and gently turn round the crank shaft until resistance is met with; continue the pull upon the handle and note the length of time the resistance is maintained, and the amount of power necessary to overcome it. The longer the time and the greater the strength required to overcome the resistance the better the compression and the more powerful the motor. The compression of each cylinder in a multi-cylinder motor may be tested by opening the compression taps, kerosene taps, or removing the sparking plugs in all the cylinders excepting the one to be tested, and proceeding as above. The time and resistance of each cylinder should be as nearly equal as possible.

To Keep Steamers at a Standstill.

To prevent the starting of a motor vehicle by other than the operator is the design of a Providence, R. I., man's invention.

With this device it is said to be impossble for the machne to run away when the operator leaves the vehicle, and should the hand-lever be tampered with during his absence, so as to throw open the throttle valve, the steam or gasoline can get no farther than the chamber of the casing, thus preventing the engine from moving the machine. When the operator takes his seat, his weight depresses the seat, and opens the valve, after which he pulls the hand-lever to open the throttle valve and allow the steam to pass through the ports of the casing direct to the engine.

COMMITTEE'S RECOMMENDATIONS

Suggestions for Future Contests Based on Experience Gained in Recent Reliability Run.

In all probability the report in full of the reliability contest committee of the Automobile Club of America will not be ready to be given out until next week. The committee, consisting of Messrs. Scarritt, Chamberlain and Hill, has, however, made a number of recommendations for future contests, based on the recent Boston run. The most important of these follow:

First—That A, B and C certificates be abolished. So many contestants will in the future be able to qualify that even an A certificate will have but little value.

Second—That gold medals and not cups be awarded to winning contestants by the club.

Third—That the observers should be changed daily. This could be readily accomplished by taking the badge from the first arrival at any control and making an appointment to supply him with a badge after the arrival of the last carriage; then giving the badge of the first observer to the second, taking the second observer's badge and giving it to the third, and so on.

Fourth—That the noon and night timekeepers be kept separate, and that the noon timekeepers travel from noon to noon control, and under no circumstances be permitted to sleep at the same point occupied by the night control.

Fifth—That specific instructions in writing be given timekeepers, so that they do not make mistakes in getting their green and red flags close together; and that the head timekeeper be put in charge of the water and gasoline supply and held responsible for their proper distribution.

Sixth—That an automobile be sent over the course two or three hours in advance of the contestants to replace arrows.

Seventh—That competition among contestants for early or first arrival should be discouraged. This could be done by arranging so that those that arrived first on one day be not permitted to start first at the next control. Two lines could be formed on starting, either the right or the left hand line, as they see fit, or they could start the whole right hand line before coming to the left hand, where an anxious contestant, who wants to arrive first, is located.

Eighth—That no time allowance of any kind be permitted in any rules that may be adopted; that our ideal be perfection, as all ideals should be.

Ninth—That as much as possible the emphasizing of no stops should be avoided, and that conditions meeting the average touring conditions should be, as nearly as possible, made. What is needed is a careful record of the actual work done to the car and the amount of adjustment necessary.

Tenth—That more perfect police protection be secured at controls on arrival, and that cars should be required to pass the flag rather than to approach it in groups of two or more.

Eleventh—That after passing a time flag there should be a distance of at least 300 feet to the water plug and an interval of at least 200 feet between the water plug and the gasoline supply, and that the observer and the driver be not allowed to leave the car under any pretext whatever until supplies are put aboard.

Twelfth—That no cars be allowed in any run without a reliable cyclometer, the reading of which should be observed, and which will in itself indicate whether any detours have been made from the regular road, and, if so, how much.

Thirteenth—That in making up a road book of any particular run, where the return trip is in reverse order to the outgoing, the book should be rewritten in reverse order, as it is impossible to read backward, as was necessary in our last endurance test.

Fourteenth—That in contests where the route is marked at a point 200 yards in advance of dangerous places in the highway a yellow flag, bearing the word "Caution" should be displayed.

Fifteenth—That if a contest where reliability marks are given, at points of one mile and two miles from the control, a blue flag be displayed, bearing the figures "1" and "2," respectively, in order that contestants may know exactly the distance to the control.

Sixteenth—That the rules require that the observer's books be provided with carbon sheets, and that a copy of the record of the performance of each car be publicly posted on the arrival at each control, for the information of the public and the press.

THE WELL-KEPT CAR

Readiness With Which it Starts one of the Signs of its Care and Condition.

Sometimes an excellent line can be had on the quality and the condition of a car by watching its operator start the engine. With some cars a quarter of a revolution of the crank, or even less, will do.

It was only the other day that a two cylinder car with tonneau body, standing in front of a banking establishment in Wall street, afforded an illustration of this kind. The leather coated chauffeur walked to the front of the car, took hold of the crank, gave it a short, quick turn that caused it to travel certainly not more than a dozen inches, and the explosions came immediately and with that regularity that is so dear to the heart of the expert driver.

But more directing, if less edifying, spectacles are witnessed almost every day. Who has not seen a driver tugging at the crank, turning it with all his strength and stopping only when he is almost ready to drop from exhaustion? The crowd that gathers so quickly watches and offers all sorts of suggestions. In the end the recalcitrant engine always reconsiders its refusal to go, and the car is got away on its journey. But the occurrence leaves a bad impression on everybody who sees it.

When it is not the fault of the chauffeur the trouble belongs at the door of the car. Bad compression and weak current are the most frequent causes of starting difficulties, and of these the former means loss of power. On this score alone it pays to have an engine in such a condition that it can be readily started.

A. L. Dyke's 30 h-p Combination Racing and Touring Car.

Weston's Lead Pencil Illustration.

No greater enthusiast than Frank F. Weston can be found. He fairly bubbles over with enthusiasm, exudes it from every pore.

"Come around and see the new Yale gasolene car at the show," the Motor World man heard him say, at the Eagle Rock contest last week, to a man who had confessed that he was looking for something good in the gasolene line.

"Slickest two cylinder car you ever saw. Smooth as if it ran on rails. Why, there is so little jar from the motor that you can take a lead pencil, stand it on end on the floor of the car, and start the motor without knocking that pencil over! You could not want any better proof than that, now, could you?" and his auditor admitted that he could not.

After running a new car a few hundred miles it is advisable to drain all the lubricant out of the gear box, wash the latter out well with kerosene, and, having allowed the gear box to remain open and drain, to replenish with fresh lubricant.

W. & J. Cook have purchased the automobile and bicycle repair business of H. F. Sembler, Torrington, Conn.

How the Wig-waggers Obtained Current.

A novel method of obtaining current was practised by the Second Signal Corps—the "wig-waggers"—of Brooklyn, N. Y., last week. An exhibition of "wig-wagging" was being given, during which nineteen different methods of signalling were shown.

The electric current for the searchlights and other signals was generated by an automobile by attaching a belt to one of the hind wheels of the automobile after it had been jacked up two or three inches from the ground. The trailer, so called, in which were concealed the small dynamos, is hooked on or off the automobile at will. When it is brought into use for the signalling the belt is attached to the dynamos and the power is generated from the current which propels the automobile.

When Batteries Weaken.

A useful tip is that in the event of misfires occurring through a reduction of voltage at an inopportune moment, sparking can always be improved by setting in the points a little closer. Especially is this the case when dry batteries are used, and their use may be considerably prolonged if the trouble of setting in the points when the spark gets weak is put up with. One autoist made a rough gauge on a pocket knife, scratching a mark on the base of the blade for the distance of the points when the batteries were new. As the battery power decreased the sparking gap was correspondingly reduced until the cutting edge of the knife blade was reached. This point was absolutely the last gasp of the battery.

There is said to be a great increase in the number of motor cars in Johannesburg, South Africa. Gasolene is so expensive, costing nearly $1 a gallon, that a cry is raised for cars that will use kerosene.

The Lewises' New Motor.

By the manipulation of a valve so constructed that when it is open "no air is allowed to enter the mixture, but a sufficient amount of the compression is allowed to escape," the starting of the gasolene engine invented by Albert and Shirley S. Lewis, of Syracuse, N. Y., is said to be made easy. This engine, and also a complete motor vehicle, will be manufactured and marketed if the negotiations pending between the Lewises and capitalists are brought to a successful conclusion.

The engine is so fitted that at the application of the power a slight turn of the belt wheels is sufficient to put the machine under headway, says the description. There is fitted a valve at the top of the cylinder head which is operated by a lever attached to a cam at the top of the side shaft.

When it is desired to start the machine this lever is pulled down as desired and the spark turned into the head. The lowering of this lever has opened the valve at the top of the cylinder and caused an exhaust at the first revolution, so that the turning of the starting wheel is now against only a sufficient amount of the compression to cause the first explosion and movement of the piston. This insures a start every time and calls for no exertion on the part of the operator beyond a slight turn of the wheel.

The gas mixture is composed of about six parts of gas to one of air, and the opening of the ordinary valve more or less air enters the mixture, rendering it useless. But through the valve on the Lewis engine no air is allowed to enter the mixture, but a sufficient amount of the compression is allowed to escape to insure the starting, rendering the first explosion weaker than normal, but sufficient. By the use of this valve when the engine is working the speed may be increased or decreased at will.

From Porto Rico to Providence.

The People's Rapid Transit Co. of Providence, R. I., the incorporation of which was noticed last week, is really a reorganization of the Porto Rico Transportation Co., which was formed in Olneyville in 1901, for conducting an automobile passenger and express service between Ponce and San Juan, on the island of Porto Rico. About $20,000 was sunk in the project. The new company will operate the same automobiles in Westerly, and between the town, Watch Hill and White Rock.

The Week's Patents.

714,128. Exhaust-Muffler. William Barber, Brooklyn, N. Y. Filed Jan. 23, 1902. Serial No. 90,925. (No model.)

Claim.—1. An exhaust-muffler provided with an inlet pipe or tube having perforations in its peripheral wall, and a baffling spring of resilient material coiled around the inlet pipe or tube in such manner that the gases as they emerge from the peripheral perforations or passages will impinge upon the spring, substantially as shown and described.

714,164. Pneumatic Tire. Wilbraham Edmund, Ealing, England, assignor to himself, and Alister Macnab, London, England. Filed Jan. 3, 1901. Serial No. 41,963. (No model.)

Claim.—1. In a pneumatic tire, the combination of a transversely inflexible and longitudinally flexible and compressible tread having a wide practically flat inner periphery and separately inflatable air tubes each made of air retaining and laterally inextensible material, arranged one inside the other, and adapted to take a flat bearing against the flat inner periphery of said tread, substantially as described for the purpose set forth.

714,180. Internal Combustion Engine. Clark Hendricks, Riverside, Cal. Filed December 11, 1901. Serial No. 85,512. (No model.)

Claim.—1. In combination a power cylinder having an igniter and also inlet and outlet ports at one end, means for supplying an explosive mixture to said inlet port, a conduit for a power liquid connected to the other end of the cylinder, a valve or valves between this conduit and the cylinder, a valved supply-pipe or pipes connected to the end of the cylinder adjacent to the said conduit, an air chamber connected to said conduit, a sliding power piston in the cylinder provided with a piston rod working through the cylinder head at the liquid end of the cylinder, and means connected to this piston rod for automatically controlling the gas supply and exhaust devices, for the purpose set forth.

714,201. Storage Battery. Stanislaw Laszynski, Berlin, Germany, assignor to Titus von Michalowski, Berlin, Germany. Filed Feb. 23, 1901. Serial No. 48,611. (No model.)

Claim.—1. A storage battery having a negative electrode of nickel oxid, a sponge-zinc plate as positive electrode and as electrolyte a solution of potassium or sodium aluminates, which are able to conduct the current, but not to dissolve the sponge-zinc electrodes after discharging.

714,237. Steam Boiler. Charles M. Raymond, Cleveland, Ohio. Filed July 3, 1902. Serial No. 114,233. (No model.)

Claim.—1. A tubular boiler comprising a plurality of superposed sets of coils, each having an upper and a lower coil, and a connection between the upper coil of one set and the lower coil of the next set below, substantially as described.

714,271. Vehicle-Wheel. John M. Alderfer, Sharon Center, Ohio. Filed May 9, 1902. Serial No. 106,528. (No model.)

Claim.—1. In a vehicle wheel, the combination with a channel iron rim, of a cushion tire, and pins extending transversely through the tire, the length of the pins being greater than the distance between the free edges of the side pieces of the channel iron rim, the base of said channel iron being provided with an annular rib through which said pins project and thus prevent the creeping of the tire with respect to the channel iron rim, substantially as set forth.

714,333. Vehicle Tire and Rim. Franklin G. Saylor, Franklin, Mass., assignor of one-half to George H. Morrill, Jr., Norwood, Mass. Filed Aug. 22, 1902. Serial No. 120,647. (No model.)

Claim.—1. A vehicle tire having a fibrous core, clamps upon said core and an outer covering of rubber vulcanized around said core and clamps, substantially as described.

714,352. Combined Hot Air and Gas Engine. Charles A. Anderson, Erick A. Erickson and John Wickstrom, Chicago, Ill., assignors to Chicago Motocycle Company, Chicago, Ill., a Corporation of Illinois. Filed Mar. 28, 1900. Serial No. 10,570. (No model.)

Claim.—1. In combination with a cylinder and a pair of pistons arranged to work therein, means for controlling said pistons to impart a synchronous but differential movement thereto comprising a pitman support upon each piston, one of which is in the form of an extension whereby the pitman is adapted to be connected with the piston at a point remote from the latter, a pitman pivotally connected with each pitman support, a main shaft located out of alignment laterally with a line extending between the points of connection of the pitmen with their respective pitman supports and at a point intermediate the distance separating said points, and crank connections between said main shaft and pitmen, the axis of said main shaft being located at one side of said line extending between the points of connection of the pitmen with their respective supports a distance less than the length of the crank arm.

714,353. Combination Hot Air and Gas Engine. Charles A. Anderson, Erick A. Erickson and John Wickstrom, Chicago, Ill, assignors to Chicago Motocycle Company, Chicago, Ill., a Corporation of Illinois. Filed Dec. 18, 1901. Serial No. 86,433 (No model.)

Claim.—1. In an engine, the combination of a power cylinder having a heater at one end thereof, and having a port for the intake of air and a separate port for the intake of a combustible fluid, power and transfer pistons in said cylinder, and means to cause said pistons to alternately approach and recede from each other, substantially as and for the purposes set forth.

714,445. Air Condenser for Steam Propelled Cars or Vehicles. Edward R. Bridson and Harry Brough, Nottingham, England. Filed Apr. 17, 1902. Serial No. 103,434. (No model.)

Claim.—1. The combination with a steam propelled vehicle having a steam generator and a steam engine, of a plurality of nearly horizontal tubes a open to the atmosphere at one end and arranged parallel to the line of motion of the vehicle, a box such as g into which the other end of each tube a enters, means for conveying the air and uncondensed steam from the box g, a chamber m placed at right angles to the tubes a, small tubes b connected to the said chamber m and having their open ends inserted in the ends of the tubes a, means for conveying the steam from the engine to the chamber m and means for drawing off the water from the box g, substantially as described.

714,492. Explosive Engine. Francois Lagoutte, Asnieres, France. Filed June 26, 1900. Serial No. 21,680. (No model.)

Claim.—1. In an internal combustion motor, the combination of a conduit for exhaust gases leading from the motor cylinder, said conduit having an air inlet near the point of connection to the motor cylinder, valve means controlling the said inlet, valve means controlling the flow of gases through the conduit and located farther from the motor cylinder than the said air inlet, and connecting mechanism which causes one valve to open when the other is closed, and vice versa.

714,501. Steering Device for Automobiles or Other Vehicles. Winthrop L. Mead, South Orange, N. J. Filed Jan. 24, 1902. Serial No. 91,041. (No model.)

Claim.—1. The combination with the frame of a vehicle providing pivoted axles and a bearing plate therebetween having a hole or passage for the steering rod and a fulcrum for an eccentric strap, of said steering rod and means for turning the same, an eccentric seated on said bearing plate and adapted to be turned by said steering rod and a leverlike eccentric strap also seated on said bearing plate and slotted at its fulcrum and having an arm or extension b, and rods connecting with said extension and with said axles, substantially as set forth.

714,574. Vehicle Spring. Edward F. Gehman, Reading, Pa. Filed Nov. 4, 1899. Serial No. 735,783. (No model.)

Claim.—The combination with a vehicle having upwardly curved side bars with depending bolsters at each end thereof, and hangers secured diametrically opposite each other in rear of the bolsters, the upwardly curving continuous leaf springs extending longitudinally with the side bars and having their opposite terminal ends secured to the hangers, and said continuous leaf springs being bent inwardly at their central portions, of the body having intermediate bolsters at its central portion, and securing bolts passing through said body, its bolsters, and the inwardly bent portions of the leaf springs thereby securing said parts together, whereby to elevate the body above the side bars so as to permit of a vertical movement of said body between the side bars, substantially as described.

714,597. Carburetter for Explosive Motors. Emile L. P. Mors, Paris, France, assignor to Societe Anonyme d'Electricite et d'Automobiles Mors, France. Filed Jan. 28, 1902. Serial No. 91,613. (No model.)

Claim.—1. A carburetter having a mixing chamber, an injector nozzle opening freely into the chamber, air supply openings above the nozzle and means to simultaneously cut off the air openings and nozzle from the supply pipe to the motor, substantially as described.

714,614. Speed Regulating Mechanism for Motor-Vehicles. Salvatore Scoguamillo and Charles H. Posner, New York, N. Y. Filed June 26, 1902. Serial No. 113,354. (No model.)

Claim.—1. In a speed regulating mechanism, a power transmitting shaft formed of a fixed and a longitudinally movable section, a plurality of pinions, means for supporting the pinions, means carried by the longitudinally movable section of the power transmitting shaft and adapted to engage with the pinions for suitably connecting them thereto, causing the rotation thereof, and means operated by the pinions for imparting movement to a vehicle.

The WHITE Steam Carriage

AN AUTOMOBILE THOROUGHBRED.

In the 500-mile Reliability Contest from New York to Boston and return, arranged by the Automobile Club of America, three **WHITE STEAM STANHOPES** covered the distance without stop or trouble of any kind—a perfect performance.

The White Steam Generator is absolutely non-explosive, gives pressure in five minutes from cold water, and once in motion is self-regulating. In touring, the **WHITE** will make 100 miles without adding a drop of water or fuel to the original supply.

Write for full particulars, including Prof. Thurston's report on our steam generator, and the official reports of important endurance contests.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.

Volume V. New York, U. S. A., Thursday, December 11, 1902. No. 11

GRAHAM-FOX READY

Company to Make Engine and Complete Cars Formed—The Details.

It is not surprising that the production of a successful compound gasoline motor, as described in detail in last week's "Motor World," should set the trade to wondering and discussing. The trick has been tried too often, always with the same result, not to have such a different ending as this viewed with astonishment.

With such a motor as the Graham-Fox perfected and in successful operation, and a car equipped with it equally a "go," it is an easy and natural transition to the formation of plans for its manufacture and marketing. These have already been fully matured, and it is probable that within ninety days the new product, consisting of both motors and complete cars, will be on the market.

The Graham-Fox Motor Company is the name of the concern that will undertake the task. It was incorporated a year ago, and within a few weeks what amounts to a practical reorganization has taken place, new capital and capitalists brought in, and plans set on foot that will result shortly in the beginning of an active campaign. Such was the plan outlined to a "Motor World" representative by E. C. Snow, Jr., president of the company on Monday.

With Mr. Snow, who will assume the active management of the company, is associated—in addition to Messrs. Graham and Fox, the inventors and practical men in the concern—Irving Brokaw, son of Isaac Brokaw,, the well-known capitalist and clothing merchant of this city.

For more than a year Irving Brokaw has been the patron saint of the enterprise, the man to whom even more than its inventors, as the latter cheerfully admit, is due the final perfection of the motor. He has worked unremittingly and unstintingly for its success, and has devoted both time and money to the task.

The plans of the company were brought out in considerable detail in the talk with Mr. Snow, who is in the insurance business, wealthy and an ardent automobilist.

"The plans are practically completed," he said. "Our capital of $500,000 is divided into $250,000 preferred and $250,000 common. Nearly all of the former has been taken. Contracts have been signed, by virtue of which we start with more than $100,000 in cash, and there is little doubt that this will be materially increased by the closing of negotiations now pending. We are, therefore, in good shape financially.

"We shall make both motors and motor cars, motors for launches separately, the others only with the complete car. The latter will bear a strong resemblance to the Mercedes-Simplex, and will, of course, be equipped with our Graham-Fox compound gasolene motor. Two types of cars will be made, one of 20-horse power, the other of 45.

"As to the price, while I do not wish to make any promise that we may not be able to fulfill, yet I feel safe in saying that these cars will be offered at figures that will create a sensation. How far this is true you may imagine when I say that $1,500 for the 20-horse car and $3,500 for the 45-horse are the figures we have in mind.

Cadillac Adopts a "No-accessory Policy."

The new Cadillac Automobile Company, of Detroit, as a part of their policy have decided on a radical departure. Their cars will not be equipped with lamps, bells, horns or odometers; these will be listed as "extras" and be charged for accordingly. On the other hand, however, all Cadillacs will be provided with mud guards as part of the regular equipment. The Cadillac people with much justice contend that lamps, horns and the like do not properly come within the scope of car manufacture, but are rather items for individual choice and which afford agents opportunity for sales and profits which properly belong to them.

Smith Leaves G & J Company.

After ten years' service with the Indianapolis Rubber Company, of which the G. & J. Tire Company was an offspring, Harold O. Smith has resigned the management of both. He has irons in other fires, but is not yet ready to speak of them.

AMERICA'S FORFEIT POSTED

Winton Deposits Cash and the Automobile Club Challenges for the Bennett Cup.

Talk of America being represented in the race for the Bennett International Cup next year has at last reached the stage of action. The Automobile Club of America has declared itself a competitor. The action of the club followed closely upon that of Alex. Winton, of Cleveland, who on Monday depasited through Percy Owens, of New York, $600 with the club as an earnest of his willingness to be a contestant. This insured the American organization against loss, and it was "up to the club" to do something.

On Tuesday the Race Committee of the A. C. A. met and decided to nominate three entries for the race. Who the other two beside Winton will be is not known yet, but Dame Rumor in her most impressive tones says that H. S. Harkness is willing and that a special Peerless car is being built for him. Others who are mentioned as probable competitors because of their having made inquiries at the club about the race, are Windsor T. White, who is known to have a special steam car in the course of construction, L. P. Mooers, of Cleveland, and W. K. Vanderbilt, Jr.

It is not to be doubted but what the definite and positive attitude of Mr. Winton urged the Automobile Club into action and the registered letter containing the formal challenge with $600 forfeit was mailed on Wednesday to the Automobile Club of Great Britain and Ireland, which is the present custodian of the cup, S. F. Edge, of London, having won it last year from the French club.

Those present at the meeting when it was decided to enter three contestants in the name of the club were Georfge Isham Scott, chairman; Dave H. Morris, Harlan W. Whipple and A. R. Shattuck.

The rules of the contest require that clubs recognized internationally may enter not more than three machines each, and that the challenge must be in hand by January 1, accompanied by a deposit of $600, which is forfeited if at least one car does not appear to start.

DO MOTOR WAGONS PAY?

Some Evidence Presented by a Concern That has Half a Million Dollars Worth of Advance Orders Booked

While most manufacturers are still holding aloof from what they concede will be the mainstay of the automobile industry in the future, the draught vehicle, there is a lesson of much interest in what is being accomplished by the one concern which has been strenuous in this line of production. According to their own statements, the Vehicle Equipment Company, of New York, has turned out a few more than two hundred vehicles this year, counting both light and heavy machines. Their plant has been extended three times during the current year. The concern now has half a million dollars worth of business under contract, and the salesmen have instructions to book no orders for delivery inside of five months. Early next year they are to have a new factory adjacent to the present one, which will have, it is said, a bona fide capacity of 600 machines the first year.

Concerning the present reliability and efficiency of the electric trucks and wagons of the company, which has been questioned at times, because of some firms having been reported as first adopting and then abandoning them, the Rainier Company, selling agents, is in possession of some remarkable documentary testimony going to show that by forging ahead where others have hesitated this concern has gone a long way toward bringing the commercial traffic automobile to the stage of practicability that it must attain.

Some of the evidences of this are of such nature and so unquestionably authentic that their value as information to the general world of automobiling transcends competitive bias and other commercial considerations. The Central Brewing Company, after trying one truck experimentally for several months, ordered four new ones of five tons capacity each. Concerning the work done by the experimental truck, as compared with the results obtained with horses, the company makes the following statement:

Truck left Ninety-second street and Third avenue with fifty half-barrels (five tons) at 8:30 a. m.; arrived at One hundred and sixty-sixth street and St. Nicholas avenue at 9:33 a. m.; left One hundred and sixty-sixth street and St. Nicholas avenue with forty-four empties (sixty pounds) at 10:02 a. m.; arrived at brewery at 10:50 a. m. Distance, eight miles. Time, two hours and twenty minutes. Horses take five hours and they make only one trip daily. The motor truck makes the trip three times a day.

Other facts gleaned regarding the increasing use of draft automobiles are: The Ehret Brewing Company, which is now running two motor trucks, has ordered six new ones. The Valentine-Loewcer Brewing Company has ordered five new trucks. Saks & Co., drygoods, have ten motor delivery wagons and not a single horse-drawn vehicle of the sort. Lang & Co., flour merchants, are using a truck that carries fifty barrels of flour to a load, and delivers 1,200 barrels a week, which formerly two team could not quite accomplish.

Most of these practical merchants agree that after the original investment, the cost of maintenance of such motor trucks as they are now using is less than what would be the cost of horses to do the same work.

Some of the departures now being made in the way of special hauling constructions f r particular lines of business are of more than trade interest and might make material for saffron hued newspapers. Many New Yorkers are familiar with the sight of a huge trunk which moves along Broadway and down to the Liberty street ferry, without horses and on wheels that are three-fourths concealed under the body of the

trunk. It is the electric truck of Marlow, Sullivan & Co., of New York, and runs on delivery service between that city and Newark, where the factory of the firm is located. Something even more striking is now being built for the New York Railway and Steamship Timetable Distributing Company. It is a facsimile of a Pullman car, with vestibuled platforms, windows and everything complete, and to further carry out the illusion the wheels run underneath the car, as they do in the genuine article. It is seventeen feet long, with a hauling capacity of two tons, and is designed to take the place of four horse-drawn trucks.

A five-ton dumping truck that acts similarly to the brick dumping carts, is another new sort of commercial car. This is being built for the Eaton, Cole & Burnham Co., and is designed to haul castings.

Another novelty is a five ton truck with tracks on the bed of it, especially built for a new corporation which has itself the novel scheme of shipping and storing furniture and other goods in a portable safe deposit vault as big as a moving van.

Automobile ambulances there have been in plenty, but a patron of the Mount Sinai Hospital has donated to it a sick wagon that is bigger, faster and more elaborate in its equipment and finish than any other yet seen. It will be lined with white enamelled germ-proof veneering, have glass sides, with wire screens on the inside to protect the patient from broken glass in case of mishap. The stretcher bed pulls out on tracks, and everything about the vehicle is of the most luxurious sort.

Still another new proposition is a truck that is building for the New York Telephone Co., with a windlass on it especially designed for hauling heavy cables through the subway conduits. This windlass is supposed to be able to do the work of eight men.

For the first tim since the Vehicle Equipment Co. began business, it is now preparing a catalogue for 1903. In this the constructional features of the chassis used on all the company's product, which have been chiefly responsible for the success of its vehicles, are referred to substantially as follows:

"Most builders have adhered strictly to the lines of the horse-drawn vehicles, with high wheels and springs and bodies mounted on the old style 'reach' running gear and built with a single motor, thus necessitating a split rear axle, a differential gear and other complicated mechanism. In consequence of such construction the wear and tear has been enormous, and the vehicles an expensive experiment to the owner.

"These objectionable features have been entirely done away with by means of our patent 'pedestal' running gear, which is similar to the pedestals and axle boxes on a railway truck, and does not require a supporting 'reach' from the front to the rear axle. The pedestal is a single steel casting, fastened to the I beam of the body frame, and it has diagonal brace bars for additional support. This construction insures a great saving in the wear and tear on the springs and axles, and affords the rigid strength necessary for a durable self-propelled vehicle. The I beam body relieves the vehicle of any tendency to buckle, and offers supp rt for the suspension of the battery below the frame, thus leaving the inside of the body free and clear of its obstruction."

The accompanying cut shows one of the newest trucks of the Vehicle Equipment Company, the one built for the Portable Security Vault Company.

Exports are Still Increasing.

Export statistics for October, which have just been issued, disclose shipments of motor vehicles during the month to the value of $122,624, as against $55,735 during October of last year. For the ten months ending with October the exports attained a value of $970,610. For the same period of 1901 they were valued at but $262,537.

Recent Incorporations.

Denver, Col.—Colorado Automobile Co., with $50,000 capital. Directors, George W. Wood, M. W. Gano, Frank R. Ashley, Alvin B. Daniels, Lewis Lindahl.

Jersey City, N. J.—Dawson Friction Gear Co., with $125,000 capital. Incorporators, John W. Avery, New oYrk, and E. P. Dawson and Howard W. Pierce, Butte, Mont.

RECORDS NOT REGULAR

Oldfield Detroit Times Denied Recognition by A. A. A.—Authenticity is Admitted.

Official recognition of the figures made by "Barney" Oldfield at Detroit on December 1, when in the Henry Ford racing car, world's track records against time from one to five miles, inclusive, were set, has been denied by the American Automobile Association. The decision is based on the fact that the permission of the association to go for records had not been obtained. No doubt is entertained regarding the authenticity of the records; it is simply a lack of regularity that invalidates them in the eyes of the association.

The action was taken Tuesday afternoon, when the matter was brought officially before the Board of Governors of the A. A. A. at the club rooms of the Automobile Club of America, this city. W. E. Metzgar, of Detroit, presented affidavits, signed by four timers and three scorers, detailing the speed trials, and giving the times for each mile up to five miles of three separate attempts, as told in the "Motor World" last week. The best of these times were, for the mile, 1.01 1-5, and for five miles 5.20. Everything was in due form, attested by the County Clerk of Wayne County, Mich.

The stumbling block in the way of the acceptance of the records was a section of the much-criticised racing rules of the A. A. A. that has been generally overlooked. Attention had been called to it by a telegram from Cleveland immediately after the records had been made, asking if sanction had been granted by the association for the attempts.

The section is 67 (a), which reads: "No time shall be considered ocial unless the time is taken by an official of a "Recognized Meeting," or by one appointed subject to the approval of the Racing Committee."

It was pointed out that the last clause is liable to two interpretations. It is at least an open question whether the "one appointed" cannot be appointed by any reputable automobilist or association, and, if the appointment is subsequently approved by the Racing Committee, whether such action complies with the rule. Such a view was put forth at the meeting, but a majority of the Governors, those present being President Scarritt and Messrs. Webb, Pardington and Shattuck.

After considerable discussion it was voted that the records should not be recognized, owing to application not having been made to the A. A. A. before the trials.

In a conversation with the "Motor World" had with Chairman W. J. Stewart, of the Racing Committee of the A. A. A., it was stated that prior to the making of the Oldfield records no application for a sanction or permission had ever been made to the A. A. A., and that none had up to that time been issued. It was also brought out that none of the existing records have ever been officially approved by the A. A. A., nor, as far as known, by its predecessor, the Automobile Club of America, which was the governing body before the A. A. A. took charge.

"Hereafter the making and recognizing of records will be done in regular form," said Mr. Stewart. "We have no doubt whatever that the Oldfield records were made, but owing to the informality it is out of the question to stamp them officially.

"No great harm will be done, however, for we have appointed W. E. Metzgar an official of this association with full power to take charge of future trials in eDtroit, and anything he endorses will be accepted by us."

To the "Motor World" man Mr. Metzgar confirmed this, and added that Oldfield would go for the records once more and had the most perfect confidence in his ability to repeat his performances.

"He says he can cover a mile in a minute without any great trouble, and I guess he knows what he is talking about," concluded Metzgar.

Prosperity Attends Akron Rubber Plant.

An air of prosperity sits upon Akron, O., these days. Additions and extension of existing rubber plants are being made in a number of cases. The B. F. Goodrich Company is now putting the finishing touches on its big addition, and has the site purchased for an experimental plant. The Goodyear Tire and Rubber Company also has a large addition under way, and the Firestone Tire & Rubber Company has also taken steps toward building an addition to its plant in South Akron.

Automobiles at English Cycle Shows.

At the two cycle shows held in London from the 21st to the 29th ults., respectively, quite a number of automobiles were exhibited. At the National show they were confined to British cars almost entirely, but at the more popular Stanley there was a good sprinkling of American and other foreign-built vehicles. Among the former were the Prescott, the Orient, the Oldsmobile, the Rambler and the Cleveland cars.

Will Sell Stearns and Knoxmobiles.

An arrangement has been made for the handling of the Stearns cars, made by the F. B. Stearns Co., by the Automobile Headquarters, No. 65 Stanhope street, Boston. In addition to the Stearns as a leader, the Pierce line has been added, while Knoxmobiles will be sold, as heretofore.

Rainier Secures Berg Agency.

Arrangements have been concluded whereby the Rainier Co., of 393 Broadway, New York, will be the selling agents in that city for the Berg Automobile Company.

LUGS ARE STANDARDIZED

Action Taken by N. A. A. M. Regarding Rims —Chauffeur Problem Also Tackled.

As a result of the investigation that the National Association of Automobile Manufacturers has had on foot for several months, during which time correspondence was entered into with the various tire makers, a standard method of spacing lugs and of determining the number of them to be used in rims for single tube tires has been adopted.

The action was taken at a meeting of the Executive Committee, held on Wednesday of last wewek. The matter came up on the following resolution being offered:

"RESOLVED, That this association adopts as its standard the followiwng number of lugs and spacing for same on single tube tires:—

For rims 26 and 28 inches in diameter, 5 lugs, placed 25 degrees, 98 degrees and 180 degrees on each side of the valve.

For rims 30, 32, 34, 36 and 38 inches in diameter, 8 lugs, placed 25 degrees on each side of the valve, then 40 degrees and 50 degrees, alternately."

The resolution was adopted.

Followiwng the adoption of the resolution, the question of the standardization of lamp brackets was brought up. After some discussion the secretary was instructed to inquire fully into the matter.

The followiwng resolution was also adopted:

"RESOLVED, That the president appoint a committee of three to report on a plan for the examination of chauffeurs, and the issuing of certificates to them by the N. A. A. M."

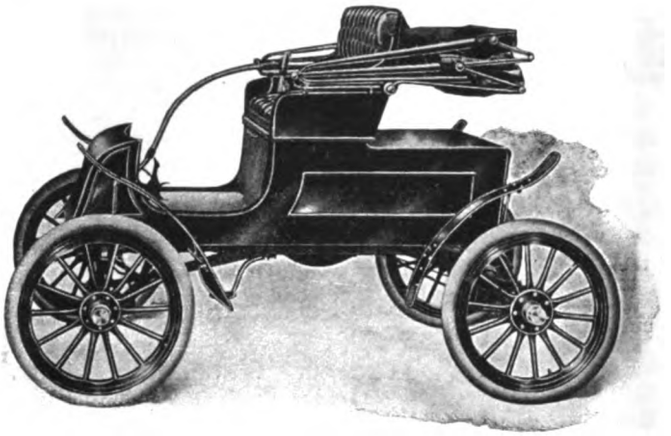
These members were elected:

Actice: Apperson Bros. Automobile Co., Kokomo, Ind.; Cadillac Automobile Co., Detroit, Mich.

Associate: The Dow Portable Electric Co., Goston, Mass.; Ralph Temple & Austrian Co., Chicago, Ill.; J. M. Quinby & Co., Newark, N. J.; The Electric Storage Battery Co., Philadelphia, Pa.

Oldfield Fails at Straightway Trials.

One second outside of Fournier's time, made on the Coney Island Boulevard, Brooklyn, in 1901, was the performance done by "Barney" Oldfield at Detroit, Mich., last Saturday, when he tried for the world's straightaway one-mile road record. His time was .52 4-5, as against Augieres' 46 seconds at Dourdan. The road over which Oldfield drove was frozen and rutty, and that he should have gone so fast was remarkable.



John Wanamaker, New York City, has acquired the agency in the metropolitan district for the Rambler gasolene runabout made by T. B. Jeffery & Co., Kenosha, Wis.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y, Post Office, November, 1900.

NEW YORK, DECEMBER 11, 1902.

All Eyes Turned Toward Paris.

Yesterday the doors of the Grand Palais des Champs Elysees, Paris, were opened to the public, the occasion being the inaugural of the Salon de l'Automobile, du cycle et des Sports, as the automobile show under the auspices of the Automobile Club of France is officially termed.

It is expected that the present show will be no less interesting than its predecessors. While no revolutionizing exhibits are looked for, there is no reason to doubt that substantial advances in constructional details have been made and will be shown on a number of the stands. Although in the past marked improvements have seemed to foreshadow the approach of finality the industry is really so young that by the time another year rolls around it is seen that designers have been able to reach higher flights and attain a point of yet greater excellence. Consequently the search for novelties, made by so many automobilists, is always rewarded and the newest models are found to be well worthy of a close and critical examination.

It seems probable that this year more attention has been given to the improvement of the transmission than to any other single feature.

There is nothing surprising in this. Even the best forms of transmission used on the well-known foreign cars are admittedly wasteful to an enormous extent. Yet they have so many good points that little serious thought is given to the matter of displacing them. Betterment, not substitution, is felt to be the only course open.

Other features that have been given attention are the better silencing of engines, the obtaining of greater simplicity ,and, last but not least, a pretty general increase in the matter of power. The latter is confined almost entirely to cars already high-powered, and it seems as if the calling of a halt in this direction was almost as far off as ever.

French cars will continue to dominate the show. The absence of the great German firm of Daimler is partially compensated for from an international point of view, by the advent of two prominent English concerns, the presence of one of which, the Napier, the winner of the Bennett Cup race, can scarcely do other than excite unpleasant emotions in French breasts. It is cause for regret that American cars have not as yet taken their place among those shown. Perhaps the day is not far distant when this state of affairs will be changed, but until that time we must possess our souls in what patience we are able to summon to our aid.

As it is, there is not now, nor ever has been any question that the French function is the premier show. In magnificence, in comprehensiveness, in the possession of the largest showing of the best exponents of the art of building motor cars, it must be adjudged the palm. The early start and phenomenal growth that has attended the French industry cannot be duplicated in any other country, and it has much to do with the result.

The Remnant Blunders Again.

With the elaborate fatuity that has characterized all its efforts for a year past, the New York State Remnant of the League of American Wheelmen has blundered again in trying to help the situation with regard to street sprinkling. First the desire to arrogate all credit to itself, and secondly through crass stupidity and the habit of not looking over the top of the little fence that encloses its own mind, the Executive Committee of the Rtmnant consulted with itself and called a meeting to take action on last Saturday night. The time fixed was inopportune, the more so because of bicycle races at Madison Square Garden, but it suited the men who called the meeting. The place of assembly was hardly one to be chosen for automobilists and drivers. The various other organizations interested in the sprinkling were not taken into counsel and asked what would be convenient. The "mighty" cycling officials were going it on their own hook; and the other organizations were simply notified to be present. The result was that they were not present, and so far as being representative was concerned the meeting was a fizzle.

The matter to be dealt with was too important to permit any working to cross-purposes, and after the call for the meeting had been sent out it was not the thing for bodies of real sense and influence to interfere, although the call was recognized as a piece of puerile insolence. The only thing to be done was to try to get a representative assemblage to the place, but it was no use. Several persons representing the cycling realm, including the Associated Cycling Clubs, were gathered in at the eleventh hour, and the resolutions drawn by the legal genius of the L. A. W., who writes licensing ordinances and personal whines, were adopted.

Reasons given for the absence of the Automobile Club and N. A. A. M. representatives, given by those clerically official in each body, are interesting. According to these men it was thought unwise for the automobilists to manifest too much interest in the sprinkling ordinances, because the Aldermen think there are barrels of money behind the automobilists, and, well ——.

The Making of Salesmen.

That salesmen are born, not made, may be putting the case a little too strongly, but it will scarcely be denied that natural aptitude plays an important part in the makeup of the successful salesman.

In the automobile business special knowledge does this to a much greater extent than it does in most other lines. The salesman is also a demonstrator, and in a majority of cases he must make the final assault from the seat of the car he desires to sell; being fortunate, indeed, if it is not also necessary to make the preliminary advances from this same vantage point. In other

Digitized by Google

words, he cannot expect to make sales from the floor of the salesroom. Talk alone will not accomplish his object; it must be supplemented with action.

It follows as a matter of course, therefore, that the salesman must be a practical man, possessed of a fair knowledge of automobile construction in general and of the cars he sells in particular.

Nowhere is ready wit of more value than in demonstrating a car that has met with a mishap, trivial or otherwise. At such times the prospective purchaser becomes a judge, uncompromising and unyielding, one whose attitude toward the car depends to a considerable extent on the methods adopted by the salesman to cope with the difficulty. It is not enough to diagnose the ailment correctly and treat it successfully. It is equally important that this be done in such a confident and dexterous manner that faith in the car, to say nothing of its operator, will be raised to a higher pitch than ever.

On the other hand, it is not necessary that the salesman should also be a machinist or a mechanic, much less an M. E.

It is infinitely easier for a born salesman to acquire a smattering of mechanics than it is for a mechanic to learn the art of salesmanship.

The best mechanic that ever worked in a shop is likely to make a lamentable failure if he essays the role of salesman. A fish out of water is in no wores predicament than some mechanic-salesmen would be if sent on a demonstrating expedition. So general is this rule that very few delusions are entertained on the score.

There is a demand for good automobile salesmen, and it will increase steadily. To meet it as it should be met, something more than a good personality, a plausible tongue and even the ability to bring a customer to the purchasing point are needed. Men who really wish to fit themselves for the part will make a study of the automobile and acquire sufficient knowledge of it to always be a little in advance of the average user.

Why not the Lap Robe?

With horse drawn vehicles a lap robe is as much a part of the equipment as a whip, and almost as much as the reins. Not even in the warmest weather is it left behind. When winter approaches robes of all sorts, sizes and conditions are found in the carriage. All this in spite of the fact that every carriage has a dashboard, designed especially to protect the occupants.

To the automobilist, however, a covering of any kind is something for which he has small use. He seems to take a pleasure in scorning them, although he drives further and faster than the man who sits behind a trotter, and he has no protection to speak of.

Why the presence or absence of a horse should make such a difference is one of those things difficult to explain. The autoist has a strong liking for the open air, and, apparently, for the breezes that do blow there. But at fifteen or twenty miles an hour, to say nothing of much higher speeds, it would naturally be supposed that he would get all of it he could possibly desire, even if a robe was drawn over his knees. But he likes his robeless condition, else why does he continue to go robeless?

In the winter, it is true, he makes some concession to tradition. He wraps himself up in robes just as other vehicle users do. But this is not always true even then, and any one can pick out cars in service without a robe of any kind about them, although the thermometer may be hovering around the freezing point.

This is but one of the peculiarities of the pastime, due, perhaps, to that inborn tendency to blaze new ways instead of sticking to the beaten path.

Carriages have, from time immemorial, been equipped with shafts, dashes, whips robes, etc. Ergo, the automobile should dispense with them, or as many of them as the circumstances warrant. Just as tops, storm curtains and protection of every kind were absent from the early motor vehicles, but have since been supplied in many cases, so the matter of robes and similar wraps is certain to receive attention in the course of time.

Warning is Always Given.

Every autoist knows that a car never goes wrong without warning of some sort. There may be doubt as to the exact nature of the trouble, doubt that is resolved only after making an examination. But there was something to herald its coming, something that made it plain that there was a storm brewing. If it is a weak spark, for example, it did not pass immediately from the point where it was delivering its normal power to another where it is insufficient to cause an explosion. An attentive driver would detect the deterioration that was taking place before the current gave out entirely. In fact, it is hardly possible for him to be utterly at a loss. He may mistake the cause of the trouble, but at least he has ideas on the subject, and it is no very difficult matter to see if they are correct.

The most obvious explanation of the cause of something that bothers an autoist is frequently the correct one. Yet it will be passed by and the search directed into other channels, the motor or other parts being gone over carefully and with much expenditure of time, all without result. How often is it the case that both the carburetter and the ignition system are overhauled in vain, only to find that the gasolene is shut off? Or even that the electric current has not been switched on.

"Seventeen cars which took part in the Boston reliability run have been awarded gold medals. The records, the runs and the awards are generally admitted to be 'fakes,'" says the alleged American correspondent of Motoring Illustrated. It would be interesting to know just what sort of company "Autogo," as he signs himself, frequents, who the men who "generally admit" the existence of the "fakes" are. The vileness of the calumny is exceeded only by its transparent absurdity.

Down Boston way automobilists who are arrested charged with violations of the speed law have the choice of two horns of a dilemma. If they plead guilty, and thus save the prosecutors all sorts of bother, they are let off with a $10 fine. If they deny the charge, however, and show fight, the verdict is against them, anyhow, and the fine is made $25. A more brazen method of intimidating accused persons it would not be easy to find.

Of all the faculties none are more highly trained or laid under contribution more frequently than the sense of hearing. It is by his ear that the autoist learns that there is something wrong, and frequently it tells him what the trouble is. A dirty spark plug, a worn or ill fitting clutch, a "knock" in the engine, an idle cylinder—these are discovered by the ear, and it is only after that that the eye and the hand play their part in putting matters to right.

From Paris comes the story that a woman automobilist arrested for exceeding the legal limit was sentenced to imprisonment. Confinement for twenty-four hours in Saint Lazaire Prison, among vile malefactors of every description, followed.

When the carriage is horseless there is all the more need of horse sense on the part of its driver.

Comment Unnecessary.

NORTHERN MANUFACTURING CO.
AUTOMOBILES.

DETROIT Sept. 25th, 1902.

The Goodman Company,
154 Nassau St.,
New York, N. Y.

Gentlemen:--

In justice to your publication, "The Motor World", we wish to state that we are receiving very gratifying results from our half page advertisement. Inquiries are coming in daily from all points of the compass and with the product and prices we are now offering, we believe very satisfactory results will follow.

We think "The Motor World" is a winner.

Yours respectfully,

Northern Manufacturing Co.

Geo H. Barbour Jr.

COMING OF THE CADILLAC

Detroit's Newest Gasolene Car Makes its bow—Many Excellent Features.

No company ever started business under better auspices than the Cadillac Automobile Company, of Detroit, Mich. Formed only a few months ago, with all the capital it can use and in other ways adequately equipped, it has already "made good" by bringing out the Cadillac runabout, a smartly designed, soundly constructed gasolene car. With such a car a more poorly fitted concern than the Detroit one should go far, and it is simple truth to say that it will

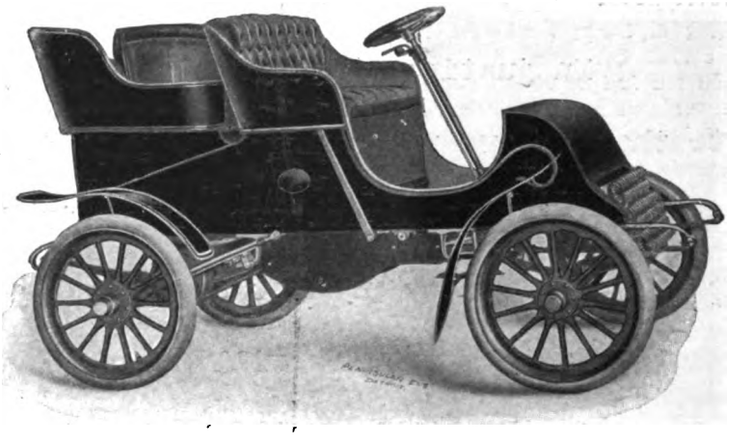
prove a factor in the trade that it would not be easy to overrate.

Of the best type of the so-called "American design," the Cadillas car is fitted with a single cylinder motor, developing 5 horsepower. It has no rubber, asbestos or other gaskets to burn, soak or blow out, thus avoiding all chance of having water in the cylinder.

Bronze bearings of generous size are used throughout. The bearings on crank chaft and crank pins can be removed without taking shaft from engine frame. They run along time without adjusting and, should they ever need renewing or adjusting, this can be easily done. The cylinder is detachable from frame and all parts of motor are interchangeable.

The feeder used in the Cadillac is one of the most distinctive features. The feed is positively and permanently adjusted before leaving the factory and automatically supplies a proper mixture for any speed from five to thirty miles an hour without change of gears. It is unnecessary to change this adjustment either in summer or winter, or in wet or dry weather.

The igniter plug is of a special design, thoroughly accessible, easily removed, positive and reliable, and is so placed as to avoid deposits of carbon which so often prevent perfect ignition.



The gears are of the planetary type, of novel design, fully protected by patents, and though only steel and bronze gears are used, their action is almost noiseless. The gears run in oil and one oil hole lubricates all the bearings.

The radiator is made of five-eighth seamless tubing, with copper discs covering them, placed three-eighths of an inch apart, thus giving a very large area for cooling purposes. The tubing forms an endless coil of twelve tubes, and, having no side plates, the liability of leakage is entirely done away with. The circulation of water, at all speeds, is so perfect that the consumption of water is reduced to a minimum.

The equalizing gears have large braking surfaces keyed directly to each wheel shaft, which act the same as drums on rear wheels, yet do away with the unsightly, heavy and complicated arrangements which go with wheel brake drums. This arrangement also avoids the insufficient brake area and excessive strain on the gears of compensating mechanism usually found in light automobiles.

The Cadillac is provided with a sensitive and powerful wheel steering gear in which the quickness of the lever and the strength and ease of the wheel are combined. It has an effective and positive adjustment which prevents the usual excessive and dangerous back lash.

The Cadillac was at first designed as a one-seated vehicle only, but having found that it could easily carry four passengers on country roads, it was decided to make a Tonneau also which could be placed on the vehicle withut changing any of its parts. The advantage of possessing a moderate priced automobile capable of carrying four people, if desired, will appeal to those who do not care to purchase a touring car for every day use.

Gasmobile's Worthy Successor.

In the space at the Madison Square Garden show secured by the Automobile Co. of America, and which will be occupied by the successor of that concern when the expected reorganization takes place, will be shown one of the most superb specimens of a French type car that has even been turned out of a factory. It is designed after the Rochet-Schneider cars, and a careful examination of it warrants the assertion that in its design and construction a standard has been set that it will be very difficult to equal.

Mobile Headquarters now in New York.

Henceforth the headquarters of the Mobile Company of America will be in this city, instead of at the factory in Tarrytown.

They have leased the entire building at the corner of Fifty-fourth street and Broadway, and General Manager Gallaher and the executive staff are now removing to that address. The building is a big, spacious structure, which will afford not only ample offices, but space for show rooms, storage and repairs.

Will not Come to New York.

Post & Lester, whose contemplated removal from Hartford to New York was noted last week, write that they have reconsidered their intention and will remain in the Connecticut capital; in fact, they say that even if the projected New York establishment had been opened, the one in Hartford also would have been continued.

Cadillac Opens in Chicago.

For the purpose of developing a business in Cadillac automobiles, made by the well known Detroit concern of that name, the Cadillac Co. of Illinois has been formed at Chicago. A store will be opened on Michigan avenue, between Thirteenth and Fourteenth streets, for the sale of these cars, and will be in charge of R. Harry Croninger as manager.

The C. G. Fisher Automobile Co., Indianapolis, Ind., has bought for $10,000 the property at No. 330 North Illinois street, now occupied by a dwelling, and will erect an automobile store

Licensing a Failure Abroad.

"The system of numbering automobiles has been proved a failure wherever it has been adopted on the Continent," says an autoist resident in Paris. "It has either resulted in indiscriminate fines without a fair hearing, as has been the case in some parts of Belgium; or in protracted legal proceedings ending in the discomfiture of the police, as in France. In the first place it does irreparable harm to the trade, and in the second, whilst putting individuals to great trouble and expense, it makes a mockery of the law and encourages evil-doers to defy it. What a strange thing it is that we always insist on learning our lessons by bitter experience of our own, instead of profiting by the experience of others. In the case in question it would be so easy to avoid taking the wrong course, and it seems to be flying in the face of Providence to neglect to take the advice of those who have tried it."

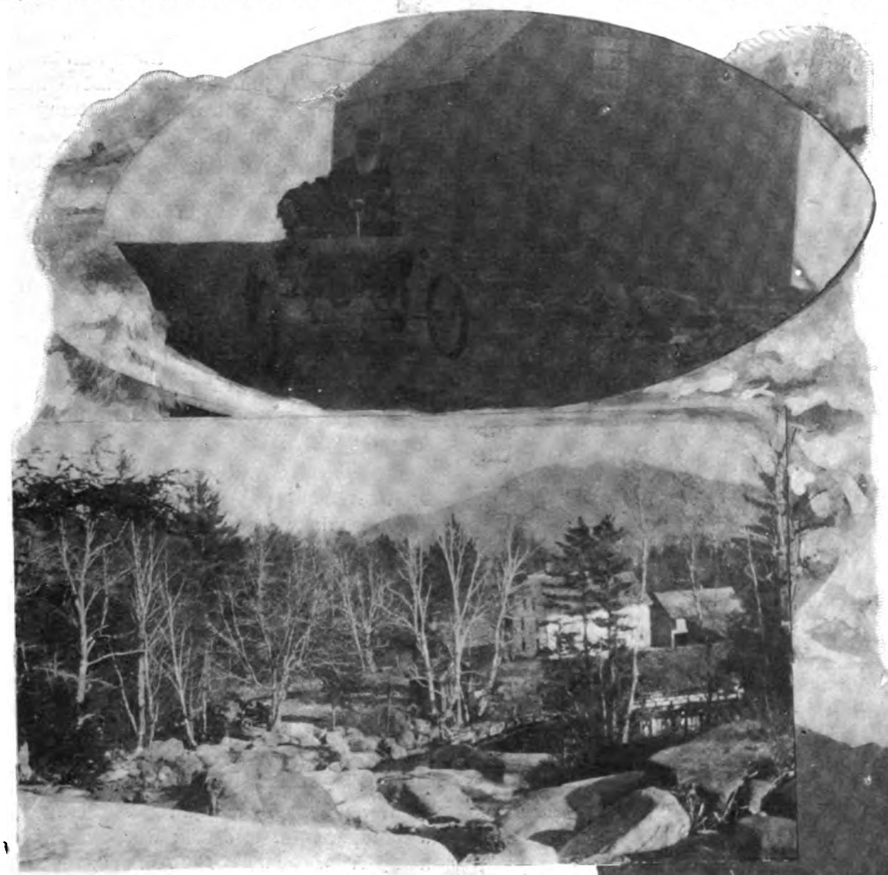
Paris has a Chauffeurs School.

A "Free School for Chauffeurs" has been established at Paris, and is said to be well attended. The following weekly programme is gone through with:

Monday—Electric energy and traction; Alcohol industry (first and third Mondays).

Tuesday—Gas and petroleum motors.

Wednesday—Geometry applied to mechanics; industrial drawing.



Thursday—General mechanics, commercial German.

Friday—Construction.

Saturday—Road geography, illustrated; Espéranto, universal language (second and fourth Saturdays).

Up Mount Washington in Winter.

Climbing Mount Washington at any time of the year is no small accomplishment. Climbing it in November after the snow has commenced to fly and the wind to roar is in the nature of a feat. The accompanying pictures attest that the feat was performed by Benjamin Smith, manager of H. B. Shattuck & Sons' Boston establishment, and that an Oldsmobile was the vehicle that enabled him to do it. As summer travel had ceased, the bridges had all been removed and weighted down, and in order to make the eight-mile ascent, Smith had to employ men to go ahead of him and relay the planking. This done, the Oldsmobile proved itself equal to the task and enabled Smith to pierce the heavy cloud banks shown in the lower picture and to ride above them. The descent wore both brakes to a frazzle.

Race Meets on the Coast.

The San Francisco Automobile Club has decided to have a two days' race meet at the Golden Gate, and another one of two days at Los Angeles a week after the automobile show in Chicago has been ended.

Touring in Spain and Africa.

Before the Automobile Club of America on Tuesday, J. Dunbar Wright delivered an illustrated lecture on an automobile tour which he took last summer through Spain, Northern Africa and the Island of Madeira.

A feature of the entertainment was the hundred or more lantern slides of camera snap shots taken by the lecturer. Views of Gibraltar, Funchal, Tangier, Granada, Cadiz, Seville and a dozen other cities in the countries visited were shown. The photographs were remarkably distinct and artistically taken. The lecture was punctuated with witticisms which called forth frequent laughter, and there were hearty applause and a vote of thanks at the close.

Reduce Membership Fee.

A special meeting of the American Automobile Association was held on Tuesday at the rooms of the Automobile Club of America in New York and the constitution amended so as to place the membership of the organization on a more rational basis. It was voted unanimously to reduce the dues so that the clubs holding membership will next year be taxed only $1 for each of its members instead of $3, as at present is required. The Automobile Club of America was represented by A. R. Shattuck and W. E. Scarritt, president of the A. A. A. W. J. Stewart represented the Automobile Club of New Jersey and the Long Island Automobile Club was represented by A. R. Pardington and F. G. Webb. The Rhode Island and Chicago clubs voted by proxy.

Buyer Pays Auctioneers' Fee.

At the auction sales which take place at the French Tattersall's many bargains may be had. The charge to the sellers is $4 for each car, and 20 cents for insurance. The purchaser pays the auction fee of 10 per cent. the fee being added to the amount of his bid.

A new three story building is being erected by the Autocar Co., Ardmore, Pa., necessitated by the expansion of the company's business. A twenty-page booklet, containing instructions for beginners, has been compiled by the company, and a copy is given to each purchaser of a car.

Commentaries

Percy Owen was wroth last week. To those familiar with the uniform serenity of the Winton's get-there New York manager this statement of mine may appear surprising; but it is so, nevertheless. Owen was madder than I had ever seen him before. His foresight and fairness are among the qualities that have brought him to the top of the heap, and when I first heard that he had "indorsed," or was frantically and officially favoring the automobile daily paper which the self-exported importation from Austria says he will publish during the show, I marvelled. The story of Owen's "indorsement" was common gossip, accredited in broken English to the ex-Austrian himself. When I mentioned the report to Owen he exploded. Some one before me had mentioned it, and what Owen said it would not be exactly fair to repeat. It was what might have been expected of him, however. He had neither indorsed nor favored it, believing, like most men, in a "fair field and no favor." Some of the gentlemen who temporarily laid this belief on the shelf and favored the Austro-American daily because of a desire to obtain certain names that are promised them, to override their better judgment, may have the fact brought home to them. I have reason to know that most of the New York dailies are not in the dark as to what is doing, and if they give the show the go-by after the first day or two, charge it up to the Austrian and the desire aforesaid. Editors of even metropolitan dailies are only human and know an interloper when they see one.

* * *

I confess that the methods of this little interloper at times befog me. His free use of Owen's name is but one sample. His venomous attacks on the bicycle people who are now in the automobile trade is another. How, after such gushes of slime, he is able to face such "bicycle graduates" as Alexander Winton, George H. Day, Windsor White, M. L. Goss, T. B. Jeffery, Jas. Becker, W. D. Gash, Geo. Banker, W. D. Mettzger and the others, to say nothing of the tire and lamp people, is beyond me. And yet he does it; which leads me to remark that the men who receive him are more charitable than I am.

* * *

The man who has a small mind seldom has occasion to change it when it comes to any question in relation to the particular vehicle or form of power therefor that he favors.

* * *

Remember me telling you about the $10,000 watch belonging to an ex-promoter I saw in a pawnshop? Remember, also, how I assured you that the owner of the watch would never again be able to fool any one, especially in the automobile industry, where the dear recollections of his promoting abilities had left an ineradicable mark? Well, I was wrong; he's just fooled them again, all right. With no other capital than his promoting nerve he induced a big Western concern which had grown wealthy building marine motors to enlarge their plant so as to turn out some five hundred vehicles, for which the ex-watch man gave them orders and plans. When the first vehicle was completed the promoter told the confiding builders that he wanted to take it to Cincinnati, where the people were holding mass meetings in their anxiety to buy that particular automobile. To Cincinnati went the vehicle, and with it the promoter. Both man and machine proceeded promptly to the finest hotel in the city, and both snorted around in a way calculated to attract public attention. With this accomplished, the promoter invited thirteen—certainly an unlucky number—of the city's leading merchants to a banquet. The thirteen came, the banquet went with them, and the giver, he went, too. Now an anxious Cincinnati hotel man wants to know who is to pay him $900 for the worthless checks the promoter gave him for the thirteen's dinner. Lincoln was wrong; you can fool all the people all the time—that is, you can if you have the ability for doing so that this ex $10,000 watch owner has time and time again shown he possesses.

* * *

When the concern who took this order from the individual who is now being sought for by the madder and wiser hotel man was first reported to be about to embark in the automobile business, I heard of it, and told an advertising friend of mine about it. You see, it was a big concern, and both myself and my friend felt sure that the first man on the spot would land the concern for a nice, big advertising contract. Well, my friend was the first man there all right. The frost was a foot thick. The gentleman who saw him told him very plainly that his concern never advertised in trade papers, nor did they care to begin. They had accepted an order from a very rich man for a mere sample lot of five hundred vehicles, which was to be followed by other orders from him which would so tax their plant that they had already given contracts for a large addition to their works. Advertise? Why should they? And in a trade paper, too! Ridiculous! The advertising man made his escape, and when later on he learned who the "very rich man" was, did he sit right down and send a telegraph to that concern putting them next? Did he?

* * *

In the building of a satisfactory road vehicle the trade has now advanced to where the generating of sufficient power with which to drive it has become entirely secondary to the securing of a satisfactory transmission. It is no problem at all any more to produce power enough to drive any vehicle, but to land that power where it is needed without too great a diminution thereof is a problem very far from being easy of solution.

* * *

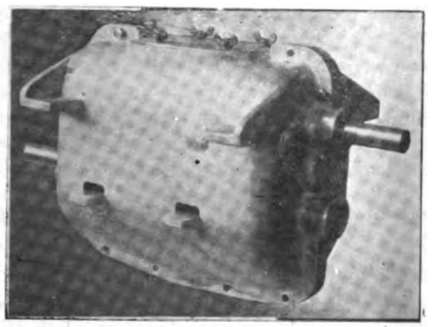
Fourteen dead and twenty-one seriously injured is the official list of hunting casualties for the season in the woods of northern Wisconsin and Michigan alone. How much greater the grand total from all the States is no one may know, but it is interesting in the mean time to note the profound silence by which this awful list is greeted by those great protectors of the people, who for months and months have cried out so long and fiercely against the deadly automobile. Have you seen one great paper which has started a crusade against these butchers who go out to rob innocent, inoffensive animals of their lives, and in clumsily attempting to do so kill and maim equally innocent and inoffensive human beings? Well, I haven't seen a line of anything attacking these "murderers." Just imagine, though, what the same silent editors would have done and said if the casualty score of the automobile had been even one-tenth that of the hunters!

* * *

Bad luck is usually the first thing which comes to the man who waits for some one else to properly care for the vehicle he uses.

* * *

Thank heavens, the papers have at last found something good to say of an automobile! Heretofore not even its most enthusiastic admirer has ever thought of claiming for the motor vehicle the glory of being a burglar banisher; but such it certainly is, if we believe what we read in the daily papers—and, of course, we do believe everything we see and read in them. While some gentle cracksmen were engaged in preparing to rob one of the very few houses in Westchester County which had not before been visited by them, according to the newspapers, "an automobile owned by a millionaire passed at a rapid rate of speed, and a moment later two men were seen running away from the scene." You see, those burglars, hardened criminals though they were, had quite naturally been close readers of the yellow journals, and knowing therefrom how deadly the automobile is when "owned by a millionaire," they had not the courage to continue burgling when they knew that so terrifying a thing was in the same county with them. Whereupon they at once sought safety in flight, leaving behind them "thirteen augur" holes in the door they had been at work upon prior to the passing of the aforementioned millionaire and his automobile. If I was inclined to be critical I might be tempted to ask just how the yellow journal knew all this in time to print the story of it next morning, but as the paper in question is conducted so as to appeal almost solely to gents of the kind who were so badly frightened, it is but natural that the gents in question should see to it that their own particular paper did not remain in ignorance of how "the automobile owned by a millionaire" had at last trespassed upon even the sacred rights of the housebreaker.



THE COMMENTATOR.

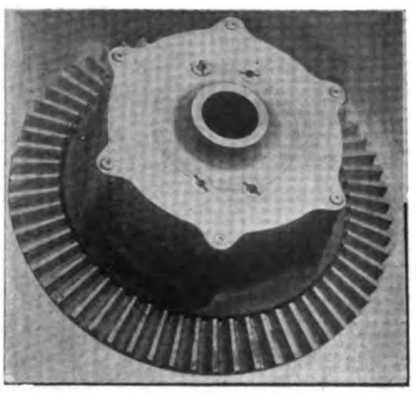
MOTORS AND GEARS

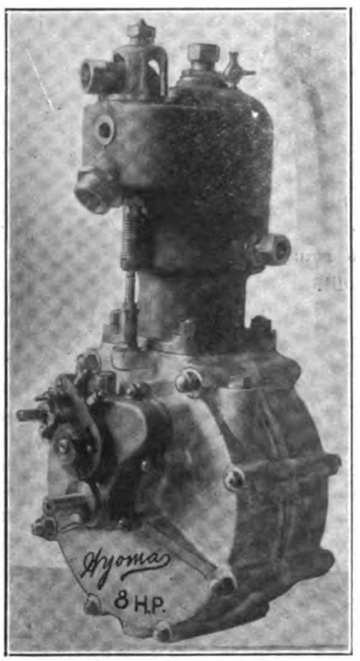


Fine Specimens of Machinist's Art Come From Reading—The Details.

With a cleverly designed and soundly constructed transmission gear weighing with case only fifty-five pounds, it is not a rash prophecy that the Reading Automobile & Gear Co., of Reading, Pa., which will shortly become the Relay Motor Car Co., will go far and fare well. The gear, which is but one of

several devices bristling with good points, need only to be seen to be appreciated. The Motor World man was profoundly impressed with the high character of the workmanship apparent, and with the smooth running and absence of friction that frequently marks other gears.

This transmission gear, styled the Wyoma, a good idea of which will be obtained from the illustration, has three speeds forward and one reverse, and only two operating levers. It will transmit up to 20 horsepower. The upper, or driving, shaft, is connected direct to the engine shaft, without any intermediate clutch mechanism. This insures positive drive. An entirely new system is employed, no bevel gears being used; the gears are always in mesh, and the power is



transmitted through hardened steel clutches, securely keyed to a 1¼ inch shaft. Provision is made on lower axle for pinion brake wheel.

The gear is self-contained in an aluminum case, with extra long shaft bearings, and shafts arranged one above the other, which allows top shaft to be on a plane with engine shaft, and which transmits the power to lower shaft, this shaft being in direct alignment with rear axle. This construction allows the gearing to run smoothly and lessens the strain on the universal connections. A ball thrust is fitted at each end of shaft.

The aluminum case is 8 inches wide, 16 inches long and 12 inches deep, outside dimensions, and has four lugs on outside, drilled with holes 11 inches between centres for attaching to frame; also has a removable lid, 4 by 6 inches, to allow easy access to and inspection of gear.

The Wyoma differential spur gear, also shown, is adapted for either 1¼, 1⅜, or 1½ inch axle. It has a manganese bronze bevel gear, its extreme outside diameter being 10⅛ inches; width over all, 4½ inches. The gear and cover are fastened by a new method. The spur gears are made with a

new pattern tooth, which is strong and durable, without back lash. The gear is made for direct drive, and has rod transmission. Its weight, with bronze gear, is twenty pounds, and the price is $30.

The single cylinder motor has a bore of 4 inches and a stroke of 4 5-16 inches, and develops 8 horsepower at 1,500 revolutions a minute. The height is 25 inches; width, 13 inches, and weight, 135 pounds. The two cylinder engine dimensions are 4 by 5 inches, weigh 265 pounds and develop 15 horsepower.

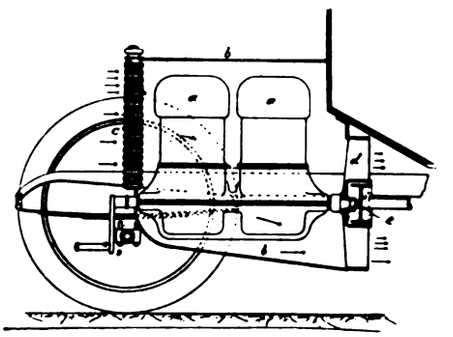
Car From St. Joseph.

An automobile possessing some interesting features has been designed and built by C. S. Gilbert, No. 1,312 North Twenty-second street, St. Joseph, Mo. The vehicle is a 6 horsepower gasolene car, fitted with heavy wood wheels, with G. & J. detachable tires 28 by 3 inches. A 1¼ inch square front axle and 1½ inch live oak axle, with standard 4 feet 8½ inch tread, is used, with spur gear differential, and ½ by 1 inch heavy Baldwin roller chain.

The transmission gear has three forward speeds and reverse, all operated by a single lever, and a powerful foot brake. The speed is controlled by shifting spark, this lever being attached to handle so it is always at operator's hand.

The engine is 5½ inch bore by 4½ inch stroke. The special feature about the car is the large diameter of cylinder and short stroke, this permitting of high rotative speed without excessive piston speed.

A special strong transmission that is very simple and not liable to get out of order is used. A strong reachless gear suitable for Western roads is fitted, and all machinery



is attached to angle iron frame, there being absolutely nothing attached to the body. The latter may be removed in one minute by taking off four nuts.

The storage capacity is twelve gallons of gasolene and six gallons of water. A large amount of radiating surface is provided, and the water will last almost indefinitely.

Maybach's Fan for Forced Draught.

No small amount of attention has been given by the makers of the famous Mercedes car to the method of cooling. The "bee hive" radiating system is well known, and now Herr Maybach, the inventor of the Maybach carburetter and other devices used on the Daimler product, has brought out a fan radiator, by means of which a system of forced draught is put into operation.

The bonnet over the engine and the tray

underneath are airtight, and have not the usual ventilating slits. In the fore part is fixed a vertical radiator, on the principle adopted in the Mercedes type; a tank pierced with multitudinous air tubes. A fan is fixed to the flywheel of the motor which drives out under the footboard the heated air round the engine and at the same time sucks in a supply of fresh cold air through the tubes in the radiator tank. A double advantage is secured by this airtight bonnet. The smell of the hot air which sometimes escapes from the bonnet and wafts its unpleasant odor into the faces of the occupants is drawn under the car and expelled behind.

STEEL ROAD IS FINISHED

A Formal Demonstration of It Proposed—All Elm Street may be Railed.

After three and a half weeks of tedious work, the first experimental section of steel road to be laid in New York City was completed yesterday. This is the piece one block long on Murray street, from Broadway to Church street. It was laid under the supervision of a special committee of the Automobile Club of America, of which Jefferson Seligman is chairman and Gen. Roy Stone and Charles M. Schwab are members. The foot-wide steel rails used were donated by President Schwab, of the Steel Trust. This piece of road is in particular designed to test the value of the steel rails for heavy trucking, and it is bu one of several stretches that are to be put down in the city. There is quite a grade on Murray street, and as there is only one track laid, and that in the middle of the street, trucks going up hill will have the right of way on it.

On Tuesday, when the road was ten-elevenths completed, that is to say, when ten of the eleven forty-foot rails which form it had been laid, Gen. Stone visited the scene to make an inspection. He was accompanied by a representative of the Motor World. It was a bitter cold day, and the general wanted to see if the road was suffering any from contraction. The ground was then frozen so hard that the men working on the road had to build fires on the granite blocks and use hammer and chisel to pry them loose. In spite of these conditions an inspection failed to reveal any ill results from contraction. The rails were then laid for all but 40 of the 440 feet of the block, and the finished part had a promising look, the paving stones having settled so that they were about flush with the rails. The scheme had a very practical look, but the truckmen driving over it did not know what it was all about. They did not try to drive so as to keep the wheels of their vehicles on the rails and their horses on the stones between them, but they did prove very satisfactorily by their ignorance tha the rails with their very slight ridges on the outside, in no way interfered with either horses or trucks. The teamsters drove over them and pulled out diagonally without knowing that the rails were there. The drivers seemed to think that the steel plates were some part of a new subway, and had nothing to do with them. Now and then, when some drived did apparently without intent follow the rails, it was plain to observers that his traction was easier. From what little could be studied in this informal way the road commended itself as a sound and practicable proposition.

General Stone was much gratified when the Motor World man told him that he had taken observations on the road last Friday after the snowfall, and had noticed that the horses did not slip when they stepped on the plates. The surface of the rails is not polished, and the shoes of the horses seemed to get a good hold on the rough finish. The fact of the rails not being corrugated or indented in any way had been the subject of some criticism. When General Stone was spoken to in regard to this he explained that the small quantity of rails turned out, only enough to build a mile of road, had prevented the production of plates with indentations, but that Mr. Schwab had said it would be perfectly easy to furnish rails of that sort when any quantity is wanted.

General Stone's idea is that the rails should have horizontal notches in them about six inches apart, and so cut that they would have but one wall, like the teeth of a ratchet, and that wall or back would be toward the down grade portion. Then, if a horse should happen to step on a rail and his foot slipped the caulks of his shoe would slide right back into the notch and there be checked. Automobile and other rubber tires would sink into slight depressions of this description and be prevented from slipping and arranged as described, such notches would be equally effective for vehicles going up or down a grade. The fact that the rails have no roughening or depressions to prevent slipping on them in wet or icy weather may, it is admitted, detract some from the satisfactoryness of the experiment, but Gen. Stone is sanguine in the belief that the value of such roads will be sufficiently demonstrated to lead to the construction of other stretches.

It is known that Borough President Cantor and the City Engineer are greatly interested in the experiment, and Gen. Stone divulged the news that if the experiments of the Automobile Club are successful, new Elm street will be laid out with two steel tracks in it.

Owing to the unsatisfactory nature of the demonshtration furnished by the haphazard driving on the rails of truckmen who have not yet learned what they are for, it was suggested by the "Motor World" representative that a day be set and arrangements made for a formal test to be made by a heavily-loaded truck being drawn first over the stone paving and then over the steel tracks, and that the Mayor and others interested be invited to witness the test. General Stone approved the suggestion and remarked that he had already planned to have an empty wagon hauled over the stones and the rails by a rope, with a spring balance attached, so that the difference in the traction could be measured.

The idea of having a formal demonstration on the road met with the approval of Chairman Seligman also, and it is probable that an exhibition date will be fixed for some day in the near future.

The next section of steel road to be laid will be in Seventh avenue, above One Hundred and Twentieth street, where a quarter or a half of mile of rails will be put down.

Steel roads cost about $4,000 a mile, according to General Stone, and are no more expensive than macadam roads. Some years ago an experimental section was laid in Chicago, but it was all wrong and did not commend itself. The steel plates used were too thin and broke, and they were laid without proper foundation and sank into the ground.

The work of laying the section in Murray street, New York, was interesting. It was not unlike the laying of a railroad, except that there was no wide and deep roadbed and no cross ties. Instead of ties, bar iron braces connected the rails every thirteen feet to keep them from spreading apart or pushing together. In putting down the rails two trenches, each a little more than a foot wide and two feet deep, were dug four and a half feet apart. On the bottom of the trenches were laid the granite blocks taken up from the street. On top of the blocks is laid broken stone and then gravel, and this is pounded together into a firm bed. The rail is laid in this bed and pounded down to a level with the abutting paving blocks. The work is done with great care and proceeds very slowly. A spirit level is used to see that the rails are on the same plane and that the grade is preserved. Working in Murray street, the men had to dig big holes in the ground every forty feet, where the rails were to be joined so that the riveters could get into them and do their work. Running in an open country, the rails would be raised to be riveted and this would not be necessary. This experimental stretch was laid at a great disadvantage, with inexperienced men and took twice as long otherwise.

Pros and Cons of the Limousine.

There is nothing about a car that will attract more attention than a Limousine body. The idea of having a glass shield and curtains to be drawn or otherwise, as desired, is a good one, but in regard to the glass front extreme care should be taken as to its use. Perhaps when starting on a journey the screen will be down, and after going some distance it will be raised, and then the passengers may for certain expect a chill or influenza. In extremely cold weather, when going a distance the glass will be found most comfortable, sheltering and shielding the passengers from the chilly blast; but if a storm arises, then the glass has to go up again through an apaque mass caused by the mud.

Subjects for British Lecture Season.

Subjects suggested for papers to be read at a forthcoming "lecture season" of the Automobile Club of Great Britain are as follows:

Road Experiences.
Continental Experiences.
Motor Car as Feeders for Railways.
Motor Car Bodies.
Iron Wheels versus Wood Wheels.
Governed Engines versus Ungoverned Engines.

$10,000 for Side Slip Preventive.

It is proposed to have the Automobile Club of Great Britain raise a prize fund of $10,000 to encourage inventors to study some preventive measures for sile-slip.

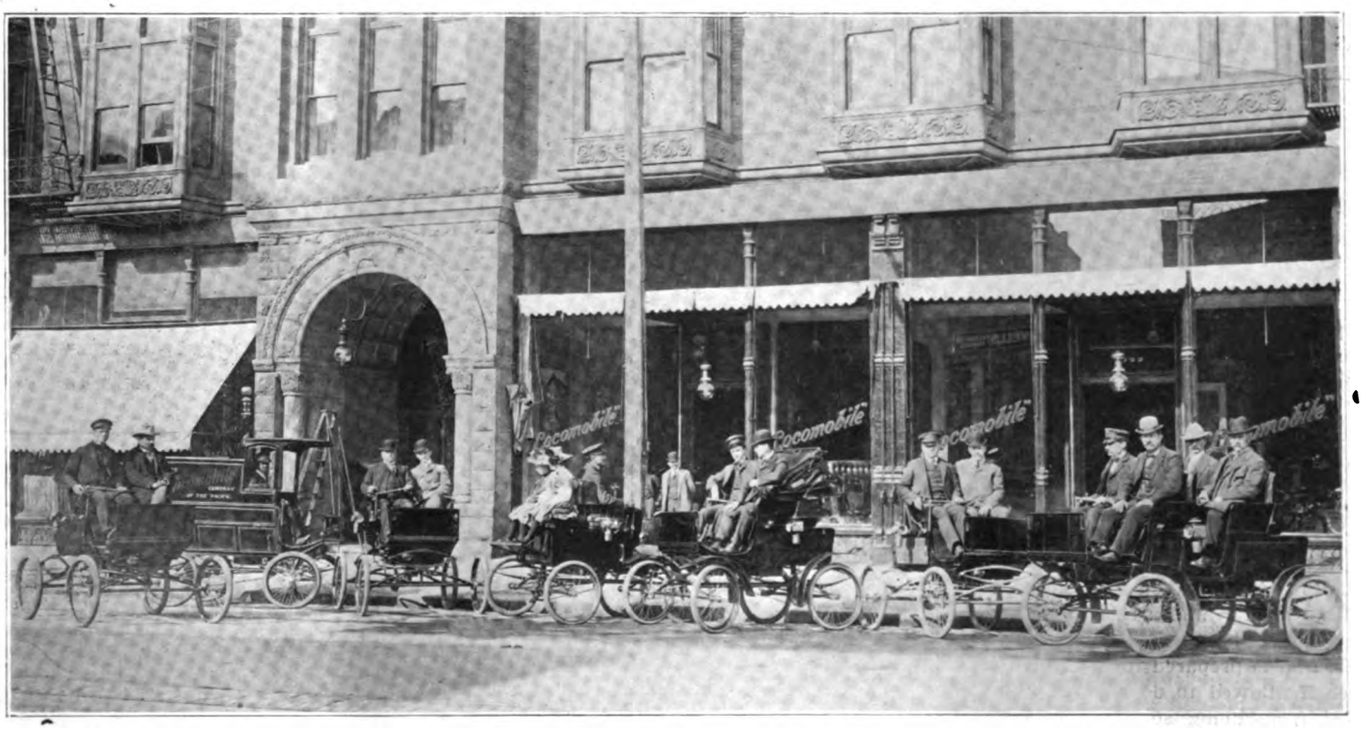
WANT TWENTY MILLION

From Congress for Improved Roads—Also Suggests National License Plan.

In calling a convention to be held at Chicago during the show, to ask Congress for a $20,000,000 appropriation, the National Association of Automobile Manufacturers not only make a move for road improvement, but also pave the way for the securing of reduced rates to the Windy iCty.

The action referred to was taken by the Executive Committee of the association on December 3, whwen the following resolution was passed.

"RESOLVED, That a convention be called for February 14th to 21st, both inclusive, at the Coliseum, Chicago, to approve a bill wwhich will be introduced during the present session of Congress to appropriate twenty million dollars ($20,000,000.00), to be expended under the direction of the National Government for a national highway; this twenty million dollars to be distributed in the various States according to population, on application by any State or county, the State or county agreeing to furnish two thousand dollars ($2,000.00) for each one thousand dollars ($1,000.0) appropriated by the Government."



The matter of license was also taken up and action independent of the Atuomobile Club of America was taken. National instead of State licenses are now favored. It was

"RESOLVED, That the National Association of Automobile Manufacturers petition the Senate and House of Representatives to prepare, at the earliest practicable date, a bill providing for a national license to drivers of automobiles which will permit interstate commerce to be carried on without inconvenience which would result from local licenses to automobile drivers."

"RESOLVED, That Mr. J. Wesley Allison be appointed a committee of one to call upon the Senators and Congressmen and ask their action at the earliest possible date."

One of San Francisco's Salesrooms.

After spending some little time in the East, E. P. Brinegar, the well-knownw San Francisco, Cal., dealer, left New York last week en route for the coast. One result of his trip was a needed strengthening of his lines, three such trump cards as the Oldsmobile, the Winton and the Vehicle Equipment Company's line of electrics, being secured. The establishment where these lines will be displayed, Brinegar's store, in San Francisco, is illustrated herewith, and is pretty good evidence that they will be well housed and taken care of by this enterprising dealer.

Receipts Were Sufficent to Pay Expenses.

The financial accounts of the Paris-Vienna race have at last been cleared up. All the entrants, of course, had to pay entrance fees. These fees go toward the expenses of the staff, the timekeepers and the innumerable tips paid along the route. The receipts and expenditures have been found to balance, so that the amounts guaranteed by certain individuals and the club have not been called up.

The agency for the Franklin car, made by the H. H. Franklin Mfg. Co., Syracuse, N. Y., has been acquired by the American Storage Co., W. 38th street, this city. Incidentally, it is said that a good-sized order was placed with it.

MARVELLOUS IGNITION

From Stuttgart Comes a Magneto That is Claimed to be Revolutionzing.

A Herr Eisemann, of Stuttgart, has recently invented and perfected a new form of ignition, which will, it is claimed, become universal, and which is actually creating a sensation in automobile circles. It has been adopted for the new Mercedes car.

It is a magneto of the ordinary type, but with two commutators, which form part of the machine itself. One of these collects the alternating current and converts it into a continuous current; the other distributes the current to the four cylinders. The continuous current from the magneto passes into a transformer coil in the secondary circuit, which gives a high-tension current, capable of flying acros sthe terminals and creating a very long spark. A spark of nearly half an inch was seen when the machine was revolving by turning the driving shaft by hand.

The armature of the magneto is carried on a sleeve on the driving shaft, and its position can be changed with regard to the driving shaft in such a manner as to advance or retard the ignition by cutting the lines of force earlier or later. The whole apparatus takes up very little more room than the ordinary magneto, and can be placed close by the cylinders, so that the high-tension wires will be very short, and will not be in proximity to other parts of the metal work. The only difficulty in this new ignition is the question of the insulation of the high-tension wires, but they will be so short and direct that a little care in the placing of the apparatus will entirely obviate this danger.

VALUE OF GOVERNORS

Different Methods of Regulating Engine Speeds Compared—Advantages of Throttling.

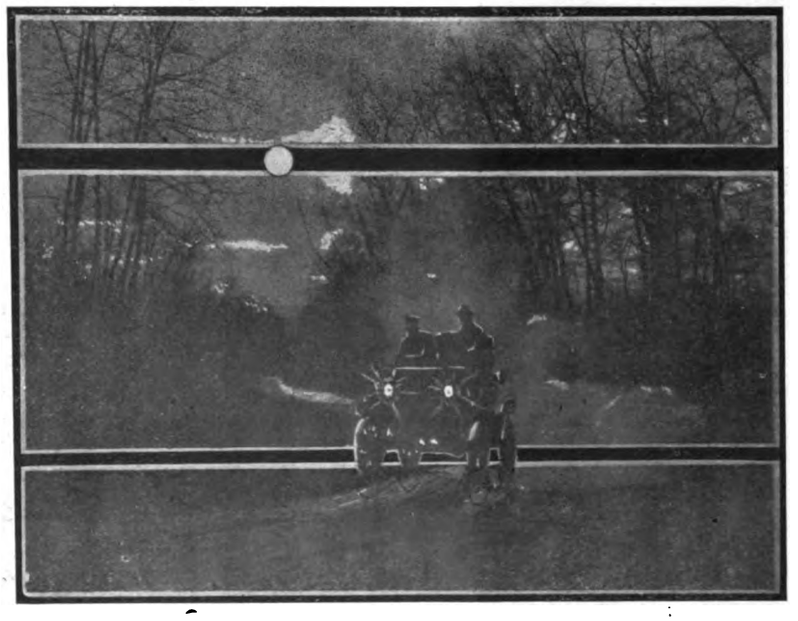
The automatic governing of the speed of gasolene motors is an interesting question, and a problem to which much attention is just now being paid. It is important, as upon its proper understanding economy in motor operation is absolutely dependent.

In the automobile motor conditions are not favorable to the use of a governor, such as is used in stationary motors, ad in the majority of cases the timing of the ignition is used to vary the speed. Under this method the primary circuit breaker is attached to the motor in such a way that it can be moved forward or backward in order to produce the spark after compression has begun to lessen, at the highest point of compression, or just before that point is reached. The first produces combustion under a gradually lessening pressure, hence reducing the power of the explosion. Ignition on the highest point of compression gives a far more powerful impulse, inasmuch as the same amount of vapor is exploded in a smaller compass. When ignition occurs just before the highest point of compression is reached, the power is still greater because of the extremely high pressure obtained by compressing, not only the original volume of vapor, but the heated gases generated by the early ignition as well. Care is necessary that the spark is not timed so far ahead as to cause the motor to kick back.

Now, though the speed of motors may be governed by iguition, it is obviously not the most economical method of obtaining the desired result, for under all these conditions the cylinder takes in the full charge of vapor, and is prepared to give forth its full power if allowed to do so; but, being prevented from doing so, the portion of the charge which is not used is, of course, wasted and discharged into the exhaust. In cases where the combustion is started when the compression is lessening, the power derived is low, but the full charge is consumed.

The necessity for devising some method, therefore, of governing speed, and at the same time economizing fuel, is obvious. At present two different methods are under experiment. One is a variation of that known as the Panhard type. It consists of a centrifugal governor operating on one end of the cam shaft, and so constructed as to throw the cams completely out of gear, completely under the valves, or in any intermediate position. The cams, instead of having surfaces parallel with the shaft, are cone shaped, so allowing the valves to be opened to any extent between the position at which the motor would run at its normal speed and that at which it would shut off entirely. The latter condition would arise only when the motor was suddenly relieved of a load and began to race. The governor would then cut out the cam, and thus, allowing no exhaust to escape, put a heavy braking force on the motor when the exhaust stroke took place. This condition would maintain until the speed were so reduced that the governor contracted sufficiently to throw the cams partially under the valves, after which the cylinders would begin exhausting a certain amount of their contents and on the return strokes would take in sufficient fresh vapor to keep the motor running at reduced speed.

The normal speed of the motor is provided for by setting the cams so that when in full operation they will allow sufficient exhaust to escape that the cylinders can be again filled, or nearly so, with the new mixture, but additional provision is made for the exhaust valves to be still further opened, so that the exhaust is entirely free from any restraint which would retard free action and power development. This feature is termed the accelerator, and is the only part of the mechanism that is not automatic. It is operated by hand or foot.



The other method is that of having the cams carried on a shaft movable from one side to the other under the valves, the distance of the movement being such as to allow the cams to open and close the valves during varying periods of the time or not at all. The cams are so shaped that for a full exhaust they maintain the valves in open positions the full length of the return stroke, while at other positions they vary the quantity of exhaust down to nothing.

The most simple method of regulation is by reducing the charge, supplying the cylinder with less than its normal quantum of explosive mixture. The volume of vapor in the cylinder is thus insufficient to generate full power, and even from such power as is generated must be deducted the loss by friction resulting from the piston striving to draw a full charge through the reduced aperture.

AN ELECTRICAL CLUTCH

Invention of the Versatile Jenatzy Proves to be Wonderfully Effective.

M. Jenatzy, who is nothing if not radical, has turned his attention to electrical clutches. He has fitted one of these to his 100 horsepower four cylinder car, one portion of the clutch being caused to become an electro magnet by current passing from the accumulators through a reducer to what, under ordinary circumstances, would correspond to the female portion of an ordinary friction clutch. In M. Jenatzy's vehicle, however, the parts of the clutch are not coned, the opposing faces of the clutch being metal and flat in the vertical plane. The grip of the driving upon the driven face is obtained solely by the amount of magnetic force permitted to the magnetized portion of the clutch. The amount of current passing to the latter is controlled through the reducer entirely by a clutch pedal in the ordinary way, and the clutch control obtainable is quite extraordinary. Indeed, so great could the grip of one part of the clutch upon the other be made that the huge car could be started on its third speed, while the amount of slip could be varied to an infinitesimal degree.

IN THE GLOAMING.

The Week's Exports.

Brazil—54 cases automobile machinery, $780.

Liverpool—4 cases automobile vehicles, $3,580.

Among the members of the Automobile Club of America elected last week were the following: James B. Dill, H. S. Harkness, C. H. Gillette, R. G. McDonald, Dr. D. G. Cochran, Walter C. Runyon; M. S. Hollis, Baltimore.

AUTOMATIC INTAKE VALVES

Bennett Cup Winner Takes up Cudgels in Their Behalf—His Experience.

Referring to the tendency to use mechanically operated inlet valves as opposed to inlet valves opening automatically, S. F. Edge, the winner of the Bennett Cup, says that the greatest theoretical advantage to be obtained is, that no time is lost in the valve opening, and consequently, full advantage is taken of the whole of the stroke. In the ordinary suction valve it is claimed that half-an-inch stroke of the piston is lost, it taking that amount of movement to create vacuum enough to overcome the pressure of the springs on the valves. He says that, owing to the three port valves on the Napier engine, only one pound pressure to the square inch is required to overcome the pressure of the springs, and that one-eighth of an inch forward movement of the piston is sufficient to give this pressure, and by making the throw of the crank one-sixteenth of an inch longer the same initial pressure and volume are obtained as would be gained by mechanically operated inlet valves.

He adds, "that in the closing of the valves the advantage rests absolutely with the automatic inlet valve, which must close practically instantaneously, and invariably at the correct moment suited to the speed of the motor.

"Some correspondents suggest that the puffs noticed from the chimney of a surface carburetter are caused through the inlet valve not closing properly, but of course it should be well known that this is not the case, but is caused by the flow of gas being suddenly checked through the closure of the inlet valve, and this check causes the incoming gas to recoil and puff out of the chimney."

The points Mr. Edge makes against the mechanically operated valve are as follows: "First, there is the additional complication and weight of the second valve-shaft and gear-wheel, and the extra set of valve-lifting rollers and guides. Much heavier cylinder-head castings; two openings in each head instead of one, hence twice the number of joints to keep tight. Greater difficulties in getting at the valves. Heavier engine body castings, as it has to be arranged with the spaces and necessary lugs, bearings, etc., for the second valve shaft.

"Surely the great aim to-day should be simplicity and reducing the number of working parts, not increasing them!

"My own experience with the hundreds of users of automobiles has been that one and all desire simplicity, and I do not think that any one can contend that this is arrived at by the addition of the mechanically operated inlet valve. It has one advantage at the present time that I do not think has been touched upon, and that is the engine when running light will run slightly slower."

Parlor Car for Canines and Felines.

An object of much interest to Cleveland (O.) people is an automobile ambulance used for a queer sort of patients—no less than dogs and cats. Stray canines and felines are conveyed in state to the haven where skilful treatment and kind ministration await them, and they are made to feel at home on the journey by two thoroughbred bulldogs belonging to the establishment.

The proprietor of the hospital is Dr. W. F. Staniforth, and it is located at No. 684 to 688 Central avenue. A steam automobile has been fitted up especially for the purpose of conveying the dogs and cats to and from the hospital. The upper part is used for cats and the lower part for dogs, and is nicely fitted up with drinking trays, rugs, etc.

Dr. Staniforth purposes to build in the country near Cleveland a large home for stray dogs and cats, with a hospital attached for the care of those sick and injured. He invites the co-operation of people who admire dogs and cats to aid in the enterprise so as to build something that would be a credit to the entire country.

New Quarters for Long Island Club.

The Long Island Automobile Club has moved from the corner of Bedford avenue and Fulton street and has secured new and more commodious quarters in the house of the Lincoln Club, at No. 65 Putnam avenue, between Irving Place and Classon avenue.

KANSAS CITY'S NEW LAW

Three Speed Districts Provided for in the Ordinance—Other Regulations.

After undergoing considerable modification, the bill before the Kansas City (Mo.) Board of Aldermen is again up for consideration. In its present form it provides that instead of a speed limit of ten miles in the district bounded by Fourth street, State line, Nineteenth and Cleveland avenue, which the lower house defined, the city is divided into three speed districts. The maximum speed between the river, Fifteenth street, Broadway and Locust street is six miles an hour. Between Locust and Troost, Fifteenth and Twentieth, Broadway and the State line it is ten miles an hour. In all other parts of the city the maximum speed is fixed at fifteen miles an hour.

The size of the letters or figures on the side lamps is reduced from four inches to three inches, and a four-inch number must in addition to this be suspended on a leather apron at the back of the vehicle.

The minimum fine is increased from $1 to $5. The maximum remains at $500.

The examining board to pass on the qualifications of applicants for licenses to operate the machines is to consist of the superintendent of streets, who is to be chairman, and two expert autoists to be named by the Mayor. The lower house designated the examining engineers of the city.

The ordinance is to apply to visitors and tourists in all respects except licenses and numbers.

Digitized by Google

BENNETT CUP RULES

Provisions for Contest in Which American Cars Will Complete are Iron Clad.

In view of the fact that America is to play a part in the contest for the Bennett Cup next year, the rules governing the race have now a new and particular interest. It will be noticed that the name of the Automobile Club of America is not included among the clubs specifically mentioned. It will have to be voted to be permitted to contest, as provided for in the third paragraph of Rule I. The A. C. A. is recognized by the French club, however, and as it is the only one in this country that will apply there is no doubt but what it will receive and retain recognition.

Rule 1.—Every foreign automobile club recognized by the English Automobile Club is entitled to challenge for possession of the cup.

The recognized clubs are: The Automobile Club of France, the Belgian Automobile Club, the Swiss Automobile Club, the Turin Automobile Club, and the Automobile Club of Germany.

Any club not on this list, but desiring to be enrolled, must be voted on by a majority of the foregoing clubs, on condition that this majority shall include the club or clubs of the country t which it belongs. On the application of one club, however, another club may be disqualified by the ruling of the majority.

Rule 3.—Any recognized club wishing to challenge shall notify its intention to the holders of the trophy some time before the first day of January of the particular year; such notification to be sent in a registered letter addressed to the president. This letter must state the number of vehicles to be entered. The challenging club shall at the same time deposit with the club in possession of the trophy the sum of one hundred and twenty pounds. This deposit sum to be returntd to each one of the competitors presenting himself at the start.

The president of the club holding the trophy, even though his club take no part in the race, shall in all cases be notified by registered letter of any club desiring to compete.

Rule 4.—Each club may be represented at the contest by one, two, or three vehicles. Should one or two only of the three appear at the start, this fact will not prevent the other competing clubs from exercising their right to run their full complement of three vehicles. Should two or more clubs of the same country desire to enter vehicles, it must be understood that three vehicles only are admissible for the representation of each country. The clubs of the same country or nationality must, therefore, select for themselves the three vehicles they wish to be entered. Should they be unable to agree the vehicles will be admitted in their order of application.

Rule 5.—The cup shall be contested at some date between the 15th of May and the 15th of August in each year. The precise date must be determined by general consent of the competing clubs, and should be fixed as early as February 1 in each year.

Rule 6.—In the event of the club in possession of the trophy receiving challenges from several clubs, there would be but a single race, the challenged and the challenging clubs being represented each by its complement of three vehicles.

Rule 7.—The competing vehicles must come within the following racing definitions laid down by the Automobile Club of France in 1899: The vehicle must weigh over 400 kilos. (7 cwt. 3 qurs. 14 lbs.), and must carry, seated side by side, at least two passengers, each of a minimum weight of 70 kilos. (11 stone 3 lbs.), or, should the passengers' weight fall short of the above figures, the deficit must be made up by ballast. The car weight of 400 kilos. is taken to mean weight unladen—that is, without passengers or fuel (coal, petrol, water and accumulators), without tools or spare parts, bags, clothing, or provisions.

Rule 8.—The vehicles must be constructed wholly and in every detail in the country of the clubs they represent.

Rule 9.—The vehicles must be driven by members of the competing clubs, and the two seats must be occupied during the whole of the course.

Rule 10.—A committee shall administer the rules and regulations. Each competing club shall nominate a delegate. Mr. Gordon Bennett, the presenter of the cup, is entitled to a seat on every such committee. The Automobile Club of France also, even in the event of its taking no part in the race, has the right to be represented on the committee by a delegate. The delegates shall nominate from their number a president, who will have the casting vote in the event of votes being even. Should the committee be unable to decide upon a president he shall be nominated by Mr. Gordon Bennett, or, in default, by the President of the Automobile Club of France. The committee shall appoint a starter, an umpire, and timekeepers, and these need not be members of the committee. The committee is empowered to enforce strict obsrvance of these rules, and to adjudicate on any incidents that may arise therefrom. This committee shall officially register the race.

Rule 11.—The race shall be run on a road in a single stretch, over a distance of not less than 550 kilometres (about 344 miles), and not more than 650 kilometres (416 miles). The course may be made from town to town, or divided into several courses, out and return—the distance of each course, however, not being less than 150 kilometres (93¾ miles).

The club holding the trophy is entitled to choose the route, and it is incumbent upon this club to locate and specify the route precisely by means of a registered letter to the challenging club at least three months before the date decided upon for the race.

Should a change of route be found necessary subsequent to specification, a registered letter must be immediately despatched advising the clubs of the change. Such change shall not be made except in case of absolute force majeure, and only with the sanction of the committee appointed under rule 10.

Rule 12.—The race shall be run in the country of the club holding the cup. This club shall, however, be empowered to run the race in France.

Rule 13.—The start of the competing vehicles shall be simultaneous. They will be placed in the following order: In front, one immediately following, one vehicle of each of the challenging clubs in the order in which the challenges were received. Then the second vehicle of the club holding the trophy, followed in the same order by the second vehicles of the challenging clubs. Lastly, the third vehicles ranged in the same order.

Rule 14.—The first vehicle to cross the line of the finish shall be declared the winner. This vehicle will have won the cup for the club it represents, even should it be the only vehicle of its set completing the course.

Rule 15.—In case of a dead-heat between the club holding the trophy and one of the challenging clubs, the club holding the trophy shall retain the cup.

Rule 10.—In case of a dead-heat between two challenging clubs, they shall race again under the same conditions within two months, it being understood that rule 5 shall not apply. Should these two clubs be unable to decide upon a route, they shall cast lots. Should one of the clubs decline to run the second race, the other shall become ipso facto the holder of the cup.

Rule 17.—After the homolocation of the race, the cup shall pass into the hands of the winning club within fifteen days. In the event of a dead-heat, and while awaiting the decision upon such result, the cup shall remain in possession of the club already holding it.

Rule 18.—Should one of the challenging clubs be sole competitor at the start, it shall run over the course in a maximum time, to be fixed by the committee appointed under rule 10. Failing which, the club already holding the cup shall retain possession of it.

Rule 19.—It is understood that no club shall actually win the cup. The club merely holds the cup subject to the foregoing rules.

Rule 20.—In the event of the club holding the trophy ceasing to exist, the cup shall revert to Mr. Gordon Bennett, or, in default, to the Automobile Club of France.

Rule 21.—The races for the cup, whether they be run in France or elsewhere, shall always be run subject to the racing rules of tht Automobile Club of France, issued in 1899.

Rule 22.—The cost of transportation of vehicles and their fuel, etc., shall be at the expense of the owners of the vehicles, or of the clubs they represent.

Rule 23.—The traveling expenses of the committee elected under rule 10 shall be at the expense of the clubs they represent. The expenses of organization of the race (fees and travelling expenses of timekeepers, advertising, fees paid along the route, etc.), shall be paid by the club holding the cup. After the race these expenses shall be equally divided between the club holding the cup and the challenging clubs. It must be understood that the share due from clubs which have entered vehicles and have not taken part in the race thereby become forfeit to the club in possession of the cup. The £120 deposited under rule 3 will be paid by the club in possession of the cup.

Difference of Opinion Between the Judges.

Unexpected and smacking of opera bouffe methods was the ending Tuesday of the case of Mason Crocker, chauffeur of Reginald G. Vanderbilt, charged with speeding in excess of eight miles an hour. The case was tried at Jamaica, the defence being that the indictment was faulty and the Cocks law itself unconstitutional. At its close the prisoner was discharged.

Justice Forker stated that he did not believe the policeman's story, and that he thought Crocker was innocent. Justice Fleming at first agreed with Justice Keating in holding the prisoner guilty, the vote being two to one. Then in consequence of the protestation of Attorney Schoonmaker, he changed round and declared that as the prosecution had not proved that there was no local ordinance, as it should have done, he must find for Crocker. Justice Keating was still stubborn, but there were now two against him, and Crocker was dismissed.

Now the different parties concerned are trying to figure out just how matters stand. It is only clear that Crocker is free and clear. To a Motor World man Attorney Schoonmaker stated that he would take no further proceedings in the matter.

Digitized by Google

INDICTMENT IS FAULTY

And Cocks Law is Unconstitutional, Claims Attorney for Vanderbilt's Chauffeur.

In addition to attacking the constitutionality of the Cocks law, counsel for Mason Crocker, chauffeur for Reginald G. Vanderbilt, contends that the indictment under which his client was arraigned is defective in two particulars. He asks, therefore, that the complaint be dismissed.

Both from its bold attack on the constitutionality of the obnoxious law, as related in the Motor World last week, and because of the nature of the defects referred to, the case possesses unusual interest. In a talk with the Motor World representative Lawyer George W. Schoonmaker called attention to this, and pointed out the grounds upon which he has asked for a dismissal of the complaint.

Crocker was arrested near Jamaica, Borough of Queens, and accused of exceeding a speed of eight miles an hour. He was arraigned in the Court of Special Sessions, Second Division, at Jamaica, and upon submission by Mr. Schoonmaker of the points referred to the case was taken under consideration by Judge Fleming.

In his brief Lawyer Schoonmaker touches upon the binding force of the Cocks and the Doughty laws, respectively, and holds, as have many other lawyers, that the former has not been repealed, and that one should be interpreted through its relation to the other, instead of separately, as the autophobes who are using it as a weapon against autoists insist upon doing.

"The word 'unjustifiably' in the first part of the petition must be deemed to refer to the amended part of the section also, and the complaint is fatally defective in not alleging that the defendant 'unjustifiably' did the acts therein set forth," contends the brief.

"The well known rule of noscitur a sociis applies to the construction of this section. Words and phrases in a penal statute are to be judged by those which they accompany or with which they are associated. The section in question begins by describing it as a misdemeanor to 'unjustifiably' run horses, etc. The part applying to the driving of automobiles is not a new section or new provision, nor even a new sentence. Leaving out the part of the statute applying solely to horses, the section reads as follows: 'A person driving any vehicle upon any plank road, turnpike or public highway, who unjustifiably . . . drives or operates an automobile or motor vehicle,' etc. It is not a crime in every case to run horses on a highway, neither must it be assumed to be a crime in every case to operate an automobile at a greater speed than eight miles an hour. The crime consists in doing these things 'unjustifiably.' Is it to be presumed that the legislature intended to make it unlawful for a physician to hurry to the bedside of a dying patient in his automobile, or for one of the chiefs of the Fire Department to hasten to a fire in his automobile, or for a man to run his automobile more than eight miles an hour under other circumstances in view of which all fair men might applaud the act?

"The defendant's view of the construction of the statute is borne out further by the fact that there is still upon the statute books, as part of the highway law, an act which regulates the speeding of automobiles. This act has not been repealed, nor is it expressly repealed by the act under consideration. If, therefore, the two acts can be reconciled and construed together this should be done. Here is the act referred to:

" 'No person driving or in charge of an automobile or motor vehicle on any street, avenue, parkway or driveway in this State shall drive the same at any speed greater than is reasonable and proper, having regard to the traffic and use of the highway, or so as to endanger the life and limb of any person.'

"It is fair to assume that the legislature, by the act of 1902, attempted merely to define more nearly the words underlined in the above section of the highway law. 'It is not,' they may be presumed to say, 'reasonable and proper to run an automobile more than eight miles an hour in a city or village, unless such speed is for some reason justifiable.' Courts should so construe an act as to fairly and reasonably carry out the legal intent of the legislature. Will the court in this case say that the legislature makes the absurd declaration that it is in every case unreasonable and improper (or unjustifiable) to run an automobile at a greater speed than eight miles an hour within a city or village?

"This cannot be, for in Section 163 of the same highway law, which also is not repealed, this provision occurs:

" 'No ordinance, rule or regulation adopted by the authorities of any municipality in pursuance of this section or of any other law, shall require an automobile or motor vehicle to travel at a lower rate of speed than eight miles per hour, within any city, town or village of the State in the built up portion thereof, nor at a lower speed than fifteen miles per hour where the same are not built up.'

"Here stands an unrepealed declaration of the legislature that it is not unreasonable nor unlawful for an automobile to run at a speed of upward of fifteen miles an hour in the portion of a city not built up, and expressly prohibiting a city or village from limiting the speed within that rate."

Proceeding to the point raised attacking the constitutionality of the Cocks law, the brief states:

"The sections of Title XVI of the Penal Code, including Section 666, are unconstitutional, as Section 668 provides that the fines collected under these sections must be paid to the American Society for the Prevention of Cruelty to Animals or to some other similar society.

"In the recent case of Fox vs. Mohawk and Hudson River Humane Society, 165 N. Y., 517, the Court of Appeals held that a law permitting a humane society to charge license fees for the keeping of dogs, and to retain the money, was violative of the provisions of the constitution prohibiting the paying or loaning of the moneys of the State, or of a county, city, town or village, to a private individual or corporation.

"It is true that Mr. Justice Cullen, who wrote the opinion of the court, said in a dictum that probably pecuniary penalties for offences would not fall within these restrictions because there was little right of property in them.

"But if the moneys do not belong to the State, county, city, town or village, to whom do they belong?

"If they do not belong to any of these public bodies they are certainly public moneys, and come within these restrictions.

"If they do not, they must belong to the individual who pays them, and then their payment to a private society would violate the provisions of the constitution prohibiting the taking of private property for other than public uses."

It was intimated by Mr. Schoonmaker that in case the Court of Special Sessions denies the motion to dismiss the complaint the appeal would be carried to a higher court.

Rural Free Delivery by Automobile.

What is thought to be the first rural automobile mail route in the United States has been established between Portland and Pennville, Ind. It covers a distance of twelve miles. Wilbur F. Hitt, of Indianapolis, a special agent of the railway mail service, has investigated it and is much pleased with it. The government officials at Washington are interested in the experiment, as it is expected that many automobile mail routes will be established in the near future.

Postoffice patrons at Pennville and small points along the line are served with mail twice each day by automobile. The machine leaves Portland at 8 o'clock each morning and 4 o'clock in the afternoon, arriving in Pennville an hour later.

Thirty minutes afterward it starts on the return trip, making the run home in an hour. For a time a large automobile, capable of carrying a dozen passengers, was in the service, but since bad weather set in a two-passenger runabout has been added to the service.

Wants a Jury Trial.

For the second time a Long Island automobile speed case is to be decided by a jury trial. Paul Verget, chauffeur for Cord Meyer, is the accused, and a jury has been selected and Dec. 13 set for the case. Deputy Sheriff John Garvin, who made the arrest, claims that the accused covered one-eighth of a mile in 15½ seconds, a rate of 29½ miles an hour. When arraigned at Hicksville Verget's counsel entered a plea of not guilty and asked for a jury trial. Verget's employer sides with him, and an array of legal talent, including a representative of the notorious Protective Association, was present at the hearing last week.

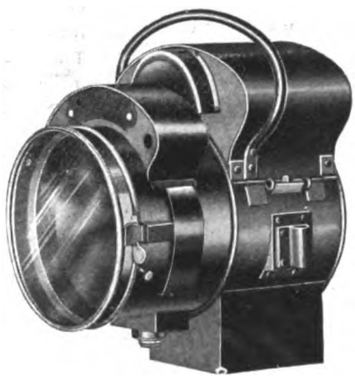
THE TEAMSTER'S TESTIMONY

Experience of Truckman With Motor Vehicles Shows Remakable Economy.

While large corporations feel no embarrassment in purchasing and trying automobile wagons for hauling purposes, the question has been very pertinently asked how near is the time when the practical truckman who makes a business of cartage at load rates can adopt the motor truck? Bearing on this point a very interesting communication is found in The Teamster, a monthly publication published in the interests of truckmen, expressmen and livery stable owners. The document has the more value because of it being written by a practical every-day trucking concern, and bears on its face the stamp of having been written not to boom any particular product, but for the information of fellow teamsters. Throughout the article no manufacturer's name is mentioned. The letter was written for the Teamster by George F. Roth, president of the Rochester, N. Y., Carting Company. It is all the more interesting because of its appearance in a paper devoted to the interests of horse drawn vehicles. The letter is as follows:

"After carefully considering and gathering the information we could from disinterested parties, who know more about the storage batteries and electrical appliances than ourselves, we concluded that the time had come when we must experiment with vehicles propelled other than by horses, and for that reason we placed an order last March for a six-ton electric truck with electric hoist, and one three-ton freight wagon, which were delivered on the 9th day of June last; since which time they have been in constant use and are giving the very best satisfaction. While we realized at the time that we bought in spite of the claims made by the manufacturers that trucks for heavy work propelled only by friction could not be a success in muddy or unimproved roads, and for that reason under the present condition of things, roads, climate, etc., that it would be a long time until motor-propelled vehicles would supersede the horses, we have added these machines as an auxiliary, as it were, to our business to help us out when we are very busy, at which time we always have good roads and on bad roads or in heavy falls of snow of course will have to fall back on the horses. We are so very well pleased with the working of these trucks that we shall, no doubt, place an order for at least four more for next spring's work.

"As to the cost of maintenance would say, we purchase our current from the Local Electric Company, and after careful computation from the time that we put them into commission, until the present time, we find that our current is costing us forty-one cents per day per wagon, oil about five cents per day, making a total cost for oil and current forty-six cents per day. It does not take any mechanical engineer to run them, and we have had no trouble whatsoever up to the present time.



"In connection with the computing of the cost of running these trucks, you should take into consideration the fact that with the freight truck we can do fully twice as much freight hauling as we could with the team, and when it comes to the windlass truck, that, of course, will do very much more work than a hand windlass; for instance, we can hoist in five minutes with this truck with one man what would take six men at least one hour to hoist, so that the saving in that is very great.

"Whether it will be steam, gasolene or electric, we firmly believe that the time is coming when most of the heavy trucking will be done with motive power.

"I forgot to say the small truck is guaranteed to draw a load thirty miles at the rate of eight miles per hour on one charge, and the six-ton truck is to carry a full load twenty-five miles at the rate of six miles per hour on one charge. We have given them the test, and they have stood up to it."

The racing committee of the Automobile Club of France and the Chembre Syndicale committee are dispatching agents to examine the roads in Spain that would form part of the route from Paris to Madrid, suggested for the next international race.

Solar Motor Lamps

Gas "Show the Way." Oil

The 1903 Models of Side Lamps, Headlights, Generators and Searchlights are of the Very Latest and Most Stylish Design.

Are the Greatest Light Projectors Ever Produced.

Scientifically and Substantially Constructed, Simple, Safe and Satisfactory.

All our Gas Lamps are fitted with NEW PATENT VALVE which turns ON and OFF both WATER and GAS.

(The Greatest Improvement in Acetylene Gas Lamps Ever Made.)

LEAGUE OF STATE CLUBS

Scope and Plan of Proposed Organization Outlined by Projector.

Assurances of support having been received from nearly every automobile club in the State, the call for a meeting to organize the Associated Automobile Clubs of New York will probably be issued within the next week.

With regard to its scope and plan of operations Secretary Frederick H. Elliott of the Syracuse Automobile Club said to the Motor World representative:

"Such an organiation would be of great help in securing favorable legislation at Albany, from the fact that the clubs throughout the State would be constantly working with their local representatives in both houses at Albany, and the fact that the Senators and Assemblymen would be approached from all sections of the State would mean a great deal toward securing such legislation as would be favorable to automobilists in general throughout the State.

"There are many other good points to be considered in reference to this organization as it would form a centralization of power taken from the influence and wealth of the many automobile clubs in the State; the officers would become acquainted with one another, and the subject of roads would be well agitated; the securing of signposts in the different counties could be taken up, and, in fact, there are many things which could be accomplished by such an organization where nothing is done now whatsoever to accomplish these ends."

Avoids Infamous Plank Road.

It is not surprising that the notorious "plank road" across the meadows between Jersey City and Newark retains its unenviable reputation. Little attempt is made to keep it in any sort of repair, and with the progress of time it gets worse—although any one who has driven over it in a car will be inclined to dispute the assertion that it could get worse.

At the present time, as the Motor World man is able to state from recent unpleasant experience, it is just about as bad as a road can be. Perhaps corduroy paths, termed roads by courtesy, can surpass it, but even this is not absolutely certain, so numerous are the loose and broken planks, so deep the mud and water holes to be found along its course.

Knowing well the infamy of this road enterprising Jerseymen have been on the lookout for some way of evading it without making the long detour via Staten Island. Success has crowned their efforts, and Frank Eveland describes a route which, while by no means "sandpapered," is yet a tremendous improvement over the plank road. The directions are as follows:

Cross the ferry to Jersey City, and one block from the ferry turn left one block, then turn right to Courthouse, then right one block and left, continuing to the Hudson County Boulevard. Turn right on the Boulevard to Newark avenue, then left through Marion and across bridge to East Newark, along the trolley tracks to Broad street, Newark.

Pleased With his Packard.

It transpires that the run between Boston and New York made by a Packard car without a stop, chronicled in these columns last week, was also a record breaking run in point of time, being a few minutes faster than anything yet made between the two cities. The Model F Packard, which did the trick, is a fac simile of the car owned and operated by Henry B. Joy, of Detroit, which went through the reliability contest in such fine shape. This car, which is shown by the illustration as being still in its contest "clothes," was delivered to Mr. Joy on May 1 last, and has been in constant use since. He took it to Watch Hill for his summer vacation, and it was entered in the run without any special preparation.

Awards for Tire Makers.

In view of the many tire troubles met with in the recent Reliability contest, the committee of the A. C. A. which had it in charge, makes special reference to the matter in its report. The committee goes so far as to suggest the advisability of holding a special tire contest, giving suitable rewards to those manufacturers who shall succeed in producing the best tires for road use.

Silence may be golden, but it never yet succeeded in borrowing a dollar or selling an automobile.

QUAKER CITY'S LIMIT

Seven Miles an Hour is Fastest Speed Solons Will Stand for.

Seven miles an hour is as fast a gait as the placid denizens of the Quaker City will "stand for." This space devouring pace applies to all vehicles except trolley cars. With fear and trembling it was decided to permit these to run nine miles an hour, it being thought that even a Philadelphian will not object to such a breakneck speed where they are concerned if he is in the car.

The matter came up on Friday last, when the law committee of the Philadelphia City Councils gave a public hearing on the pending ordinance to regulate all traffic on the city's highways. There were present representatives of the Road Drivers' Association, the Carriage Manufacturers' Association, Livery Stable Keepers' Association, the Rapid Transit Company and the Philadelphia Automobile Club.

The speed section of the proposed ordinance reads:

"No streetcars shall be run upon any portion of the streets or highways within the section bounded by Erie avenue, Snyder avenue and the Delaware and Schuylkill rivers, between the hours of 6 a. m. and 12 p. m., faster than an average of nine miles an hour, and in the district outside of said section no faster than an average of twelve miles an hour, and no vehicle shall proceed faster than ten miles an hour within the limits of the city of Philadelphia."

The part relating to vehicles was amended to read seven miles, and the words, "an average of," were struck out of the speed provision for streetcars.

CASE NOT REOPENED

Motion in Automobile Interference Suit Refused —Roberts Defeats Bachelle.

The interference case of Roberts vs. Bachelle, which has been pending in the Patent Office for some months, has finally been decided by the Commissioner in favor of the former.

The case involved an automobile covered by C. E. Roberts's application No. 30,238, November 17, 1900, and O. V. Bachelle's patent No. 659,012, October 2 of the same year. The matter of priority having been decided in Roberts's favor, Bachelle appealed for a reopening of the case, and it is this appeal that has just been denied.

In his decision the Commissioner of Patents says:

"It appears that during the taking of Bachelle's testimony a certain exhibit consisting of some pencil sketches was introduced on behalf of Bachelle. Bachelle testified that said sketches had been made by one Hopkins, who is one of Bachelle's attorneys. Hopkins was present at the taking of this testimony, but did not corroborate Bachelle, because he (Hopkins) did not at the time regard the point as material. Bachelle is of the opinion that the examiner of interferences in his decision has made the point a material one, and therefore wishes to have the case reopened to introduce the testimony of Hopkins in corroboration of his (Bachelle's) testimony as to the making of the sketches.

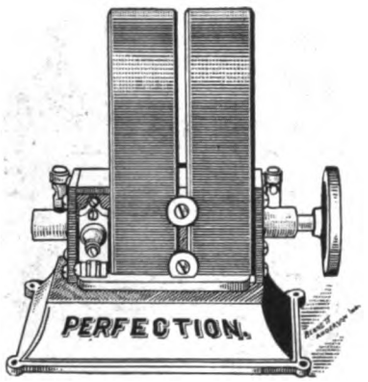
"It thus appears that the evidence now sought to be introduced is not newly discovered, but was within the knowledge of both Bachelle and his attorney at the time testimony was first taken, and the sole reason for not introducing it before was because Bachelle's attorney did not regard it as material. In other words, it was purely an error of judgment on the part of Bachelle's attorney as to the weight or effect of the evidence in question.

"To allow the case to be reopened to admit further testimony would have the effect of granting a rehearing, and it is a well established rule in the office that a rehearing will not be granted in an interference case in the absence of such a showing as would entitle the moving party to a new trial in a trial at law.

"It is a rule of practice that ignorance, inadvertence or mistake on the part of a party or his counsel is no ground for a new trial. (Dod v. Cobb, 10 O. G., 462.)

"After a case has gone to final hearing it is an injustice to the office, as well as to the victorious party, to reopen the case and give it entirely new consideration merely because the defeated party has failed to realize that facts which were at all times within his possession were material to a determination of the case. If cases were reopened for such reasons as are herein presented decisions would be lacking in stability.

"In the case of Estes vs. Gause (88 O. G., 1,336), which in some respects resembled the one at bar, the following language is used:



"'The only apparent excuse for his failure to introduce it at that time is that he did not realize its importance. While this is unfortunate for Estes, it is clearly no valid excuse, since a similar allegation could be made by every defeated party who wishes to strengthen his case. To reopen interferences upon such allegations would make it impossible to bring any case to a conclusion.'

"In the more recent case of McCallum vs. Bremer (93 O. G., 1,917) it was stated that where a party through overconfidence 'failed to present the full strength of his proofs' it was not a valid ground for reopening the case.

"It is held that Bachelle has not made out a sufficient showing to entitle him to a reopening of the case, and the decision of the examiner of interferences is affirmed."

Another Magneto From Anderson.

The Perfection magneto, made by the Perfection Magneto Co., Anderson, Ind., is put forth as a practical machine, with the parts designed with a view of making them perform the work for which they were intended.

The device occupies a space eight inches long, six inches wide and eight inches high, on a metal spring base. The bearings are hard brass, and three times as long as the diameter of shaft. They are all duplicates, can be replaced at any time, are drilled and tapped for either wick oilers, grease cups or ordinary covered oil cups.

The armatures are wound either wipe or jump spark. The armoture shaft is of crescent drill rod. The commutator is hardened copper, made on an iron core, well insulated with fibre and mica, forced on the steel shaft, and the commutator and shaft journals turned at one time and perfectly true and balanced.

Sprinkles Streets and Puts out Fires.

Charles W. Collyer, of Lynn, has been granted a patent for an automobile street sprinkling machine, which can at will be converted into a serviceable fire engine. The motive power is a gasolene engine, and water is applied by means of compressed air. One man can operate the whole machine, and great economy is claimed.

STORAGE RATES TOO LOW

Rents too Excessive to Permit Profits at Present Rates—Increase Made.

Concerning the remark of a dealer quoted in the Motor World last week to the effect that the storage business per se is not profitable, Mr. Adams, of the Central Automobile Company, at 1,684 Broadway, New York, where is to be found the most extensive garage in the city, was appealed to and asked if he could not tell the other side of the story. He replied:

"No, I cannot. There is more truth than poetry in the statement. If it was not for our sales of Plugeot, Mors and Cottereau machines there would be not money here for us."

"Why don't we raise our price? We have. We raised them the first of October. We are waiting for the other concerns to meet us now. The average storage rate? Oh, I couldn't say. There are some who will do business on any terms. We do not take in anything for less than $20 a month. We believe we have the best equipped garage in the city and give the best service and we cater to the best class of trade.

"New lines for next year? Well our Mr. Kimball is in Paris now looking about to see what there is. We expect to hear from him in a week. I understand from a friend who has just returned from France that there is a new model Mors, an 18-24, that is a marvel, almost absolutely noiseless and greatly simplified. The Peugeot car has been a great one this year. It has given as much satisfaction as any. The Peugeot has been running all the season, when other foreign machines have not. I understand they also have something new for 1903.

"Take on any new American lines? No, we will stick to imported machines in what we add to our list.

"Boarders lively? Very much so. Our carscars are in and out all the time. Of course on a day like last Friday there are not many taken out, but Friday night was a great one for electric broughams, I can tell you. Horses couldn't stand up, and that was where the automobile had its inning. Every brougham in our place was out that night."

Sue City for $85,000 Damages.

Suit has been brought against the city of New York by Frederick C. Havemeyer, Frederick Terry, jr., Julian N. Girard and Edmund Fremont for $85,000 damages. On Election Night an automobile containing the complainants and others plunged into an excavation in Hoffman Boulevard, near Long Island City. As a result Fremont's leg was so badly crushed that it had to be amputated. Terry's right leg was broken and Girard suffered severe sprains and bruises.

For the Handling of Baggage.

"There are many uses to which motor vehicles could be advantageously put. One of them suggested itself to me the other day, and I really think it would pay some enterprising concerns to look into it," remarked an autoist to the Motor World man the other day.

"While over at the Jersey City station of the Pennsylvania Railroad I got to thinking about the baggage transportation methods that have been employed there for so many years. You may know that they have a lot of huge trucks on which the trunks, bags, etc., are piled high up in the air. These trucks are drawn by horses. They are run alongside the baggags cars of incoming and outgoing trains, loaded or unloaded, as the case may be, and then taken to the baggage room, which is located underneath the main floor, or to the ferryboats.

"The haul is quite a long one, and the loads heavy enough to tax the stout horses that draw them. Now, what a stroke of genius it would be to substitute motor trucks for these equine drawn ones!

"Think of the improvement they would be. All of the disadvantages arising from the use of horses in a confined space, the sanitary difficulties, all would disappear, and increased efficiency take their place.

It is well to have a strainer in every funnel used for filling a tank with gasolene. Such a thing has been known as a carburetter getting choked because of foreign matter in the gasolene. It may not happen to a man in two years, but if it should happen on a cold, drizzly night, he would give the price of a gross of funnels with strainers in them to be out of the trouble.

Pressure gasolene feeds and circulating water pumps are condemned by M. S. Napier, head of the English firm of that name.

The Week's Patents.

714,799. Gas Engine. Joseph Hirst, New London, Conn. Filed October 19, 1901. Serial No. 79,266. (No model.)

Claim.—In a gas engine, the combination of a driven shaft, a water-jacketed casing, parallel cylinders therein, pistons in said cylinders and all disposed in a line transverse to the axial centre of said shaft, a housing, a gear on said shaft within the housing, a wheel on the extended end of the shaft, gears within the housing all meshing with the gear on the shaft and all disposed above the horizontal axial centre of the shaft and mounted on studs journaled in bosses on said housing, shafts in axial line with said studs and also journaled in said housing, crank-disks on the ends of said shafts, a crank-pin on each disk, connecting each disk to the confronting gear, and a rod connecting each piston with a crank-pin and disposed between the crank-disk and gear, all substantially as shown and described.

714,808. Vehicle Frame. Hermann Lemp, Lynn, Mass., assignor to Elihu Thomson, Swampscott, Mass. Filed May 18, 1899. Serial No. 717,265. (No model.)

Claim.—1. In a vehicle, the combination of a pair of axles, a frame, springs between the frame and the axle for supporting the frame, a battery frame below the main frame, and a mechanical connection other than one of the springs between the battery frame and one of the axles, which is capable of universal movement.

714,878. Steering Mechanism for Vehicles. James F. Duryea, Springfield, Mass. Filed May 10, 1900. Serial No. 16,241. (No model.)

Claim.—1. A vehicle having on its body a motor-driven shaft, a clutch-engaged gear-wheel to be driven by said motor-shaft, and a depending shaft-section, the axle for the forward wheels arranged under said depending shaft-section and a gear-wheel in driving connection with the axle having a rising shaft-section, means of engagement between said shaft-sections whereby they rotate in unison, but may have contracted and distended relations, journal-sleeves surrounding said axles, having upward extensions b4 b4, and supporting the springs, a part, D, supported by said springs having the pedestals depending over and embracing said journal-sleeve extensions, and on which part D, the forward part of vehicle body, rests, and between which said part and body there is relatively a swiveling movement and means provided and actuated on the body, and operating on the said part D, for turning same, substantially as described.

714,902. Means for Starting Explosion-Motors. John W. Hinchley, London, England. Filed June 20, 1901. Serial No. 65,315. (No model.)

Claim.—1. Means for starting explosion-motors, comprising a valve-casing, two seats opposite one another formed therein, ports beyond the valve-seats leading to the atmosphere, a plug-valve to open and close communication between the casing and explosion-chamber of the engine, a valve having two faces and located between the seats, a piston connected to said valve and springs acting on the piston to successively take up different pressures on the valve, for the purpose set forth.

714,982. Generator or Mixing Valve. Frank B. Widmayer, Michael E. Toepel and Adolph Potdevin, New York, N. Y. Filed May 9, 1901. Serial No. 59,379. (No model.)

Claim—1. In a generator or mixing valve, the combination of an oil-valve and a main admission-valve positively engaged or connected therewith in its closing movement, but capable of movement independently thereof in its reverse or opening movement.

715,008. Steam Explosive-Engine. Charles A. Braden, Butler, Pa., assignor to the Braden Gas Engine Company, a corporation of West Virginia. Filed October 19, 1898. Serial No. 694,035. (No model.)

Claim.—1. The combination with a gas-engine cylinder having a piston working therein, of a head forming one end of said cylinder with the piston-rod working therethrough, and a steam-engine cylinder connected to said head in horizontal alignment with the gas-engine cylinder, the head forming one end of the steam-engine cylinder, and the piston-rod being common to both the gas-engine cylinder and the steam-engine cylinder, substantially as described.

715,027. Storm-Apron. John C. Crimins, Indianapolis, Ind. Filed September 15, 1902. Serial No. 123,452. (No model.)

Claim.—1. A storm-apron adapted to envelop the upper part of the body of an occupant of a vehicle provided with a neck opening to enable the apron to be placed about the neck of the wearer, a collar-strip along the edge of said opening, means for closing the lower part of the neck opening, and a flap secured to one side of the upper portion of the collar strip and adapted to cover and close the upper portion of the neck opening.

715,150. Valve-Gear for Explosive-Engines. William J. Robb, Portadown, Ireland. Filed January 2, 1902. Serial No. 88,160. (No model.)

Claim.—1. In an internal-combustion engine the combination of a working cylinder, a combustion-space within the cylinder, an end plate secured to the combustion end of the cylinder, a lug on the face of the end plate outside the cylinder, a passageway through the lug approximately parallel with the face of the end plate, means for closing the outer ends of this passage, means of communication between one end of this passageway and the combustion-space of the cylinder, a valve to control this means of communication, means for operating the valve, a second passageway through the lug approximately at right angles to the first and in approximately the same plane and passing through the first passageway remote from the cylinder-valve end, means for closing both ends of this passage, an exhaust-port communicating with this passage, an inlet port communicating with this passage, a valve to control these ports and means for operating that valve as set forth.

715,196. Sparking Igniter for Explosive-Engines. Chauncey C. Chamberlain, Ionia, Mich. Filed December 12, 1901. Serial No. 85,661. (Model.)

Claim.—1. In a sparking device for explosive-engines, the combination with the boss within the igniting-chamber, of a fixed electrode-shaft extending therethrough and suitably insulated therefrom and provided with a sparking-point, a movable electrode-shaft extending therethrough and provided at the inner end with an arm and a sparking-point, a rock-arm having an extended sleeve portion formed at a right angle thereto and made smaller to form a shoulder therewith, and mounted loosely on the movable electrode-shaft, a coil-spring loosely mounted on the sleeve portion of the rock-arm, one end of which is secured to a cap on the extreme outer end portion of the movable electrode-shaft and the other to the rock-arm at its inner, shaft end portion, an electrode-controlling collar having an elliptical portion mounted on and fixedly secured to the movable electrode-shaft, immediately below, and adjacent to said rock-arm, and having its outer and upper free end portion abutting the same, and an angular tension-spring, the upper perpendicular portion of which bears against the elliptical portion of said electrode-controlling collar, having its lower horizontal portion secured to the supporting plate which is removably mounted on the igniting-chamber of the engine, a stop secured in the upper portion of said supporting-plate adapted to limit the movements of the rock-arm and electrode-controlling collar in combination with an automatic releasing mechanism consisting of an actuating-bar having an angular-shaped slot formed therein at its outer free end portion, and a bearing formed therewith, an actuating-hook loosely mounted therein having its free outer end portion bevelled and concavely formed, a pin extending through it and the forked portions of said actuating-arm, a lug formed thereon at its opposite point of contact, angular looped spring secured to the upper surface of the actuating-bar at its outer free end portion, adapted to engage the lug on the actuating-hook, a reciprocating lever, one end of which is mounted on the outer end of the arm formed with the supporting-plate and the other to the actuating-bar which carries it forward and backward by means substantially as described.

The WHITE Steam Carriage

AN AUTOMOBILE THOROUGHBRED.

In the 500-mile Reliability Contest from New York to Boston and return, arranged by the Automobile Club of America, three **WHITE STEAM STANHOPES** covered the distance without stop or trouble of any kind—a perfect performance.

The White Steam Generator is absolutely non-explosive, gives pressure in five minutes from cold water, and once in motion is self-regulating. In touring, the **WHITE** will make 100 miles without adding a drop of water or fuel to the original supply.

Write for full particulars, including Prof. Thurston's report on our steam generator, and the official reports of important endurance contests.

Gentlemen:

With regard to advertising in the Motor World, would say that the strongest endorsement any advertiser can give a medium is by continuing to use its columns.

We were among the very first advertisers in the Motor World when it was started. We believe at that time there were not more than half a dozen others at the outside.

We have continued with the paper regularly ever since, and so long as the paper remains as at present we undoubtedly will continue to be in it.

We advertise in the World because we know that it appeals to a certain class of the automobile industry that none of the other trade papers do, as well as covering the entire field, of course.

Yours truly,
Weston-Mott Co.

WHYS AND WHEREFORES

Of Stops Made in Reliability Contest—Elaborate Report is Submitted.

At last, after many weeks of weary waiting, the book containing the complete record of every car that started in the Reliability Run of the Automobile Club of America from New York to Boston and return, Oct. 9-15, is at hand. Looking it over one ceases to wonder that it took a long time to prepare, and concludes that the publication was worth waiting for. It is very thorough and full of interest. Every car is recorded on a page or pages of its own, even those that dropped out. The make, entrant, horsepower, weight, tires, number of passengers, style of engine and average speed per hour of each is given, together with all the stops, the cause and duration of them, the repairs and adjustments at controls, the marks lost and the reason for them.

In the following summary the most important part of the record of the cars that finished the run is given. In explanation it may be said that the report as given in the book has been abbreviated as much as possible. After the number and name of the machine comes the rated horsepower, and then an initial capital letter denoting the power, "G." for gasolene and "S." for steam; next the weight and the total number of marks accredited at the finish. The perfect number of marks, it will be remembered, was 2,092. The number of stops, both penalized and unpenalized, have been given in the aggregate, and the total time lost by them immediately follows the number. Next to the time lost by stops is given the causes of them, and after that the tinkerings at controls (not penalized), as reported by the observers. Finally the marks lost through being late or early at controls or missing them are given. Where no non-penalized stops, or control repairs, or marks lost at controls are mentioned, there were none, and it is interesting to note that several machines went through not only without a stop, but also without being touched while in a control. In this summary, the tire troubles, which are grouped separately in the book, are run along under the head of non-penalized stops and control repairs, but as they invariably have been placed at the end of the list under those headings, a little study will reveal which machines suffered most in this way and what a noteworthy number got through without any tire troubles. In consequence of making a sum total of

(Continued on page 360.)

Hildebrand to Sell Stevens-Duryeas.

C. C. Hildebrand has been appointed General Sales Manager of the automobile department of the J. Stevens Arms and Tool Co., Chicopee Falls, Mass. Hildebrand is a comparatively recent acquisition to the automobile trade, he having been appointed manager of the New York branch of the International Motor Car Co. less than a year ago. He has a reputation for making a conspicuous success of anything he undertakes, and his new position will give him the scope he has heretofore lacked.

Receivers for Taunton Concern.

An assignment to Daniel L. Brownell was made on Saturday by the Taunton Automobile Works, Taunton, Mass. No statement of the assets or liabilities has been given out. The concern was organized in 1901. Its operations have been of a local character.

Death of Conrad Co.'s President.

In California week before last, after an illness of considerable duration, S. L. Fisher, president of the Conrad Motor Carriage Co., of Buffalo, N. Y., died of consumption. The body was taken to Cincinnati, Ohio, for burial.

Chain Makers Congregate in Cleveland.

The report that there is something brewing in the chain line was given added color by the simultaneous appearance in Cleveland last Thursday of a number of the principal chainmakers.

Banker Bros. Co., Pittsburg, have just increased their capital stock from $50,000 to $100,000, all paid in.

CHALLENGE IS FORWARDED

America Elects to Contest for the Bennett Cup—Winton One of Team.

Commendable promptness has been shown by the automobilists of this country in responding to the decision of the Automobile Club of America to compete for the Bennett International Cup. Within three days from the time when the club declared itself a competitor the necessary complement of three contestants had applied for the privilege of representing the club and had posted the money necessary to obtain recognition.

The three who have announced themselves are Alex. Winton, Cleveland; L. P. Mooers, Cleveland, and H. S. Harkness, New York. Two others—Percy Owen, New York, and C. W. Matheson, Grand Rapids—have signified their intention of applying for the honor.

On last Friday night the race committee of the club had a meeting and decided to formally accept the application of Alexander Winton and to nominate him as one of the entrants to represent the club in the cup race. It is understood that this positive action was taken because Mr. Winton, who at that time was the only one who had filed an application and posted his forfeit, was the first one to come forward in a way sufficiently definite to enable the club to act, and also in consideration of the fact that he is the holder of the best recognized records made by an American machine.

In view of the probability of there being half a dozen or more candidates for the team of three, the race committee of the club has under consideration a plan to select the two remaining cars by means of trial races to be run here, following the same idea used in selecting yachts to defend the America's Cup.

The following statement and set of rules were issued by the race committee after its meeting:

The Automobile Club of America has accepted and nominated one entry for the Gordon-Bennett Cup Race. They are open

Digitized by Google

to receive further entries for that race (from which two will be nominated) upon the following conditions:

1st. Each entrant shall deposit with this club the sum of six hundred dollars.

2d. The racing committee of this club shall decide which of the entrants not yet accepted may compete in the cup race. This decision may be arrived at by a contest, or by the committee without a contest.

3d. Any entrant who is not nominated by the racing committee for the cup race shall have his entrance fee returned to him.

4th. Any entrant who, after being nominated for the cup race by the committee does not start, shall forfeit his entrance fee of six hundred dollars.

5th. If three entrants are nominated to take part in the cup race, each entrant shall have two-thirds of his entrance fee (after deducting his proportion of the expenses incurred in holding the race) returned to him, provided he starts in the race.

6th. If two entrants only are nominated, each of such entrants shall have one-half of his entrance fee (after deducting his proportion of the expenses incurred in holding the race) returned to him, provided he starts in the race.

7th. These rules are supplemental to the rules of the Gordon-Bennett Cup Race, by which each entrant agrees to abide.

The machine of Alex. Winton will, of course, be a Winton, not the "Bullet" or "Pup," but a special car that will be built. A special Peerless will be built for L. P. Mooers, but the details concerning it are not forthcoming yet. The plans of H. S. Harkness are shrouded in mystery. When asked by a Motor World man what car he would drive Mr. Harkness laughed and replied that it was a secret. He said it was not a Peerless, as had been rumored, but a car being especially built for him. What make it will be or what its horsepower he said he would not reveal before April, for the reason that if his first machine should not prove satisfactory he might want to give an order to some other maker, and it was wise to avoid the possibility of injuring any one by letting it be known that one of its machines was a failure. He said frankly that his car would not be either a Peerless or a Winton, but admitted that it would be turned out by an established factory. That his car will be of about 50 horsepower might be inferred from the fact that in discussing the proposed Matheson machine, Mr. Harkness expressed a very positive opinion that a car developing 150 horsepower would not be practicable. "It will tear itself to pieces, like those 70 horsepower Panhards on the other side," he said. "Fifty horsepower is enough."

The Matheson car is to be the product of the recently formed Matheson Motor Car Co., of Grand Rapids. It is said that it will have four 8 by 10 cylinders and develop 150 horsepower. It is understood that two such machines will be built, and that J. B. Hedges will be a candidate for selection by the committee in the second one.

GRANDER THAN EVER

Paris Show Magnificent and Thronged With Spectators—Changes and Improvements.

Opened on Wednesday of last week in a blaze of splendor, with an enormous list of exhibitors, the fifth annual Paris automobile show is now half over. As was foreshadowed, no startling novelties, no radical departures from the conventional, were to be seen. Judging by the rather fantastic cable reports, such cars as the Mors, the Panhard, the C. G. & V. and the Renault, among gasolene cars, and the Serpollet among the steamers, occupied the centre of the stage. They have all undergone changes of a minor character. Noiselessness, simplification of transmission gears—one car being shown with but two speeds, one for starting and the other for ordinary runnings—the Germanification, or Daimleration, of radiating devices, mechanically operated intake valves, weight reduction—these can be extracted from the hodgepodge of matter cabled by so-called experts.

The popularity of the event was sufficiently shown by the immense crowd that visited the palais from about 3 o'clock of the opening day until the closing hour. The wide alleys separating the rows of stands, and the stands themselves, were packed so densely that an inspection of the machines exhibited was a difficulty, and progress, save at a snail's pace, was an absolute impossibility.

The most interesting exhibit at the Panhard stall was a new 35 horsepower machine, which cannot be delivered for two years. Its salient features are four separate cylinders, to prevent heating up and to facilitate repairs; a new auto-dynamo, arranged on the same shaft with the pump of a Daimler, combining the system with a fan behind the engine, and an entirely new gas and spark combine on the wheel. Many of these points will be found on the cars of earlier delivery—for instance, a new 8 horsepower machine, which will have three cylinders and will be delivered in March.

In the Panhard exhibit is a regular gasolene engine which drives a large dynamo. Power is supplied to the electric motors for the front wheels like the Kreiger system, so popular in Paris. This machine is nothing more than an electric car which manufactures its own electricity.

Special interest is taken in the new Serpollet 40 horsepower racing Chassis, which is characterized by various changes and improvements, leading to greater simplicity in case of power and diminution of weight. The results achieved with regard to this latter detail may be imagined from the fact that the new 40 horsepower model weighs very little more than an old 6 horsepower machine. The latter type weighed about 700 kilogrammes; the new 40 weighs 850 kilogrammes.

Another most important change has been made in the generator, the vital organ of steam machines. The special form and disposition of the generator in this new model secures for it great increase of strength, diminution of weight and about double the heating surface that was available before. This means a larger supply of wholly "dry" or superheated steam, with lessened consumption of petroleum for heating.

A new pneumatic tire which is supposed to diminish the chances of that awful bugbear of automobiling known as "skidding" was shown. It has a flat surface, about two inches wide, on an envelope of tire. Whether or not this will prevent skidding remains to be seen, but several experts declared that it will in all probability decrease the speed of any automobile using it.

Herr Maybach, of the Daimler Co., was interviewed on the future outlook. "I do not think that any radical change in the essential features of the automobile is likely to be made in the immediate future," he said. "The general principle of the engine will remain unmodified. In all probability the same remark applies to the gear. Of course, the improvement and the perfection of the details are certain.

"The Mercedes model of 1903, for example, contains many important modifications. The cooler is of an absolutely new type, and weighs 30 per cent less than the one now used in the Mercedes, while presenting a cooling surface about 40 per cent greater.

"The gear case is quite new. There is only one lever, and changes of speed are effected without noise. The motor, too, has been altered very materially, with the result that there is a notable diminution in oil and essence consumption, with consequent lessening of running expenses. There is not the slightest smell when the machine is going slowly. The motor can run very slowly in every speed, from 400 to 1,200 revolutions a minute. But these modifications only come under the head of improvements in and perfecting of the details."

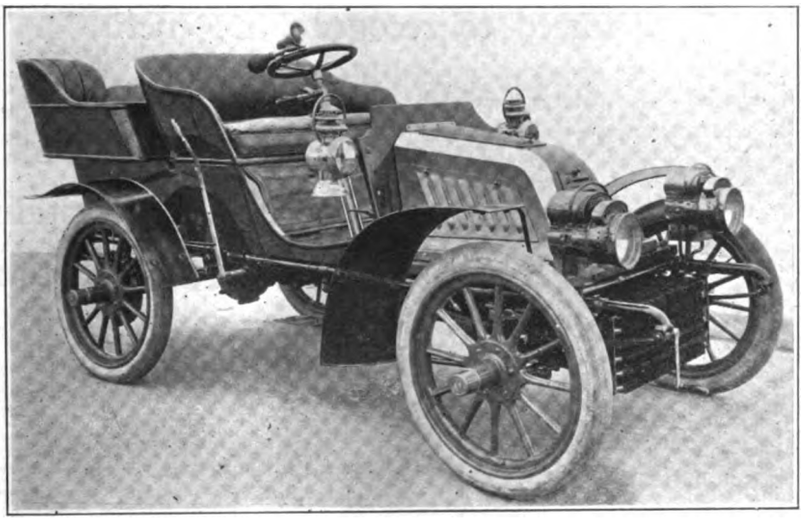
Fournier Equals Kilometer Record.

On Thursday of last week, in spite of the government interdiction of the Dourdan road, Henry Fournier made a trial for the kilometre record. He succeeded in equalling the time of M. Angures, the record holder—29 seconds.

Automobile Club's Annual Banquet.

The date for the annual dinner of the Automobile Club of America has been set for January 24. It will be held at the Waldorf-Astoria, as usual, and invitations will be sent to a list of distinguished speakers.

Quakers in New Quarters.



Rooms in the Penn Square Building have been secured by the Automobile Club of Philadelphia, and a formal opening and smoker will take place on Friday.

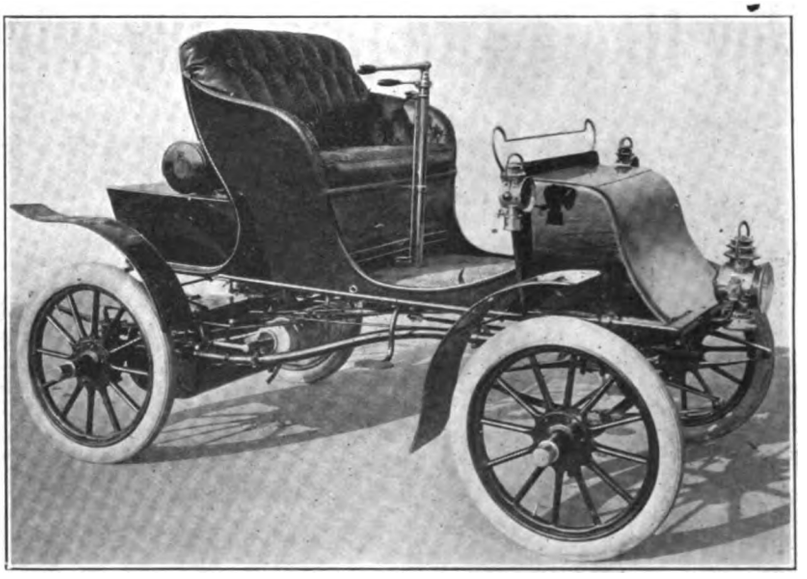
PRODUCED BY PIERCE

One New and One Improved Model Brought out by Buffalo Firm.

From the famous little Pierce Motorette comes the natural development of a larger, more powerful and improved 1903 model, and in addition an entirely new Pierce light touring car that incorporates in its constructional features points that seem sure to appeal to the buying public. Both are the product of the George N. Pierce Co., Buffalo, N. Y.

LIGHT TOURING CAR.

Chief among them is the admirable arrangement of the accelerating and retarding speed devices. All of the former are under the hand, while the latter are all under the foot. This in itself is a long step forward in the right direction, greatly aiding the much to be desired "simplicity of control." By this means confidence, that all important factor in the novice, is begotten at the start.



In appearance the car, which is shown here for the first time, is very attractive. The body lines are all on the same rake or degree. This, in addition to making a symmetrical whole, has the added practical value of giving greater water-carrying space, the added slant of the back of the bonnet enabling a larger tank to be carried.

Power is furnished by a 16 h. p., 2-cylinder upright De Dion motor, having direct drive and giving three speeds forward and a reverse. All speed changes are made with the lever below steering wheel, thus doing away with side levers.

The car is 81 inches wheel base between centres, is of standard gauge and weighs 1,500 pounds. Pierce quality of construction marks it throughout, which is equivalent to saying it is of the best.

The new Motorette is a worthy companion to the touring car, and the logical successor of the little car which made such a name for itself in 1901 and 1902. It is a bigger and better car, and one that has no superior in its field. It is equipped with a 6 horsepower De Dion type of motor that furnishes ample power. The wheel base is longer, the body roomier and more comfortable, and it has artillery wheels. Altogether the car has been wonderfully improved.

The same accessibility and simplicity that characterize the present model are, of course, retained and improved wherever possible. Both the Touring car and the Motorette will be shown at New York.

NEW "MOTORETTE."

Employee Sues Eisenhuth.

Property of the Eisenhuth Horseless Vehicle Co., Middletown, Conn., has been attached in the interests of Henry Metzger, a former employe of the company, who has brought suit claiming $10,000 damages by reason of injuries received while in the employ of the defendant company.

CLEVELAND'S CLAIMS

Her Prominence as a Manufacturing Center Warrants Holding a Show There.

A clear, concise and well printed little booklet has been issued by the promoters of the Cleveland (O.) Automobile Show, which will be held at the Cleveland Grays' Armory the week of February 9.

To the question why Cleveland should have an automobile show these are some of the answers returned:

Because Cleveland is the hub of the automobiling manufacturing industry in America.

It has no less than thirty manufactories, and among this number are the largest and most representative in the country.

There are more automobiles in use upon the streets of Cleveland, in proportion to population, than in any other American city.

George Collister, No. 317 Superior street, Cleveland, O., is the show secretary.

Reduced Railroad Fares to Chicago.

The Central Passenger Association, which embraces practically all of the territory in Illinois, Indiana, Ohio, Michigan and all points east to Pittsburg and Buffalo, has granted a rate of a fare and a third on the certificate plan for the Good Roads Convention of the National Association of Automobile Manufacturers, to be held at the Coliseum during the Chicago show, February 14-21, 1903. An application for a similar concession has been made to the Western Passenger Association and to the Eastern Associations. It is quite likely that the rate will be offered from all parts of the United States. The convention will be held in the hall on the second floor of the Coliseum Annex.

Bennett Cup Race Pseliminaries.

With the formal announcement by the Automobile Co. of America of the rules under which its team sent to compete for the Bennett Cup will be selected, and the similar regulations of the British club—the French challengers having already made their plan public—the matter is pretty well outlined.

The German makers are the only formidable competitors left unrepresented, and as yet no indication has come of their intentions.

Mercedes cars would undoubtedly add much to the interest of the race if they should take part in it, and most sportsmen will welcome their entering the ring should they do so. But even without them a fine contest is pretty well assured. The French makers will undoubtedly strive fiercely to regain the trophy that was snatched from their unwilling hands so unexpectedly last summer, while their British rivals will be no whit behind them in striving to retain the cup and, by a second victory, uphold their claim to the possession of cars equal to the Continental ones.

As to our own representatives, it is useless to deny that they have a prodigiously difficult task before them.

Experience counts in automobile road racing, as in everything else. It took three trials before Edge, the Englishman, wiped out his defeats in victory. And to the former he frankly ascribed the latter, saying that the "know how" acquired by him was a direct consequence of unsuccessful attempts.

At the same time we shall, if defeated, have few excuses to make, and probably none on the score of improper or imperfect representation. In common with the other countries mentioned as having decided upon the method of team selection, no effort will be spared to select the best cars as well as men. That the two go together is wisely recognized, while at the same time undue prominence is withheld from either. The mistake made by the French organization last summer—that of putting its eggs all in one basket—will be avoided, and a team representative of the best makes selected.

In England some criticism is made of the selection of two cars of the same make, and this without a competitive trial and of the severity governing the preliminaries.

The trials themselves are to be exhaustive, as far as they can be on a mile course. To compete in them a maker must pay $250 toward their expenses, and deposit $2,500 should he secure a place on the team. In themselves these should effectually bar out concerns in search of advertising.

Of the American team one member has been nominated. The other two may be selected with or without a trial. The latter will probably be resorted to only in case there are more than two applicants for the position. The Automobile Club of America has protected itself by requiring a deposit of $600, and this will undoubtedly serve the purpose.

Altogether the 1903 running of this historic race, which was designed to promote the production of cars manufactured wholly in the country in which they originated, only such cars being permitted to compete, bids fair to be the most important and successful as well as the most thoroughly international of all that have taken place.

Apropos of the course of the race, it has become evident that friction has arisen between the British and French clubs. The former made every effort to find a course that keeps within the strict letter of the rules, but without avail. Then a course that would do was found in Ireland, but the French club refuses to abate a jot or tittle of the letter of the cup rules; unmindful of the fact that in the last race it asked for the consent of the British club to make slight modifications, which request was acceded to. At present a practical deadlock exists, the only solution of which appears to be the selection of a Continental course, which is plainly the object sought.

Scores an Emphatic Success.

Success, with a great big S, only awaited the opening of the Paris show to claim it as its own.

Not even the great expectations formed of the annual exhibition availed to discount its attractions or to moderate the peans of exultation that have been raised as a result of the stupendous favor accorded what is universally admitted to be the "finest ever," even in Paris, that scene of gorgeous shows. An outpouring of interested sightseers was witnessed, and it went away satisfied with the magnificence of what was submitted to it for inspection and approval.

As to the lessons of the show, the real meaning of the many changes made, only the briefest summary is possible at this time. The extraction of the essence is being made, and in due course will be presented in these columns. At this time it can only be said that changes and improvements have been made, but none of them appear to be of a major character.

Some Comparative Figures.

How rapidly the automobile industry has grown is strikingly evidenced by figures compiled showing outputs during the past season of prominent concerns.

Only a year ago it was asserted by a European authority and nowhere denied that up to that time no single company had yet succeeded in turning out 1,000 complete cars. Not even the immense French factories were excepted from this sweeping characterization.

It is now stated that one concern—located in the country mentioned—produced during 1902 no less than 2,000 cars and 5,000 motors.

Digitized by Google

If this is true there can be little doubt that others—probably several of them—exceeded the even thousand, the charmed figure which none had previously been able to go beyond.

In this country there is no matter of doubt that the thousand mark has been very greatly exceeded. One concern is credited with producing in the neighborhood of 5,000 vehicles this year, and while no one else approaches this, there is no question thaa the foreign figures of a year ago have been surpassed by more than one concern.

A year ago, too, it was a liberal estimate that placed the number of cars in use in this country at 5,000.

Now three times that number would probably be within bounds. And for 1903 even greater strides are likely to be made. We may dismiss with a smile the optimistic prediction of 40,000 cars. That is quite inconceivable, if for no other reason because of lack of factory capacity. But it is quite certain that the industry will again record a big increase, an increase that will, as it was this year, be general.

It was inevitable that with the passing of the experimental stage factory capacities should undergo a great expansion. The movement has only begun, of course, and as long as the demand keeps in excess of the production and repetition processes are more and more used it must make rapid progress.

Are the Prices of Parts Too High?

When a comparatively new industry is concerned it is only natural that inequalities, inconsistencies and even injustices should occasionally obtrude themselves and do their best, or worst, to cause trouble.

At the present time a case of the kind exists. The complaint is made by both dealers and users of automobiles—particularly the later—that list prices of parts are entirely too high—unreasonably so, in fact. It is just here that the line of cleavage will come. Makers will probably admit that prices are high, but they will deny that they are unreasonably so. And it will take a lot of convincing before either side is convinced that it is in error.

The matter is of no very great importance. Yet it can easily be viewed too lightly. The best proof of this is contained in the statement made to us that users are beginning to go to repair and machine shops to have some parts made, instead of buying them from the makers of their cars. We are assured on unexceptional authority that such is the case, and that matters are likely to get much worse before they get better.

It is, of course, obvious that it is not good policy that such a habit should be contracted, much less permitted to grow until it becomes a confirmed one.

No ont is so well equipped to make the parts for a car as the manufacturer of that car. He can not only make them better than any one else, but he can (even if he doesn't) sell them at a lower price than any one else. Furthermore, he always has a stock of them, and requisitions made upon it can be honored much more quickly than new parts can be made in any shop.

Even if this is acknowledged, however, it is very easy to retort that the best judge of the price of parts is the maker thereof. As soon permit the user, or the dealer, to set the price of the car as its component parts, the maker may say. Yield on one point and it would only be a question of time when it would have to be done on the other.

Perhaps it would. And perhaps parts are not priced any higher here than in other countries. But is is quite as bad a horn of the diemma to stand idly by while new parts are made by outsiders, to the loss of the maker of thec ar and possibly to the detriment of the latter. And dissatisfied customers are not a very good investment.

The matter is worth looking into, at any rate.

Speed Change Economy.

Very often the number of changes of the speed gear made by a driver gives an excellent line on the ability of the driver and the behavior of the car itself.

In a conversation last year, Henry Fournier stated to us that in the Paris-Berlin race he had driven the entire distance on his highest speed. Even through the towns, where a slow pace was necessitated, he controlled his pace by means of the throttle, thereby being able to widely vary it with extreme rapidity, as well as avoiding wear and tear, with its incident danger of accident, on the transmission parts.

This was an extreme case, but if a powerful and speedy racing car could be driven without recourse to gear changes it is obvious that ordinary vehicles can be much more easily manipulated, especially if they have a greater range than is furnished by the minimum equipment of two speeds.

If a car will run 25 miles an hour under normal conditions and owing to poor roads or a desire to travel leisurely it is possible or desirable to go only 12 or 15 miles, there is really no necessity for using the top speed gear. If it is used, some measures must be taken to check the speed by throttling, retarding the sparking or otherwise, the use of one neutralizing the high gear. A better plan is to use an intermediate gear, thus not only affording all the speed that is wanted, but preparing the car to take moderate hills faster and steep ones without having to shift to the slower gear.

Lack of flexibility is, of course, one of the glaring faults of the gasolene car, and to it is due the necessity for a number of speed changes. If they were not necessary they would not be provided, and being necessary they must all be used at one time or another. But the ideal way to drive is to use the different gears as little as possible, running on one speed just as much as the power of the motor and the character of the road will permit.

Each change means bother, some delay, and strains and wear and tear on the entire vehicle. The transmission parts suffer most; but the engine, the wheels and tires, the springs and, in fact, every part, shares in them and makes its protest, sometimes audible, sometimes inaudible.

If a clutch begins to slip the driver should be able to detect it almost immediately, even although he may not be on the watch for such an occurrence. If he is in doubt about it, there need be little trouble in resolving it. He has only to dismount, stop the engine, and feel the clutch with his hand. It will be quite hot if any slipping has taken place.

The presence of oil on sparking plugs argues that something is wrong. It is probably due to the use of too liberal a quantity of oil, in which case it is splashed too freely. It may be caused by the use of the wrong kind of oil, one that is too light or thin. In either case a remedy should be applied at once.

It is worse to know that there is trouble impending, without being able to tell where the seat of trouble is, than to be conscious of the same approaching disaster with the knowledge that it is the ignition or the mixture or some other part of the complex mechanism that has developed a weakness.

Always use brakes alternately going down a long hill, thus giving each one time for cooling.

DOUBLE TUBE DETACHABLE

Tire of This Type Produced by Fisk—Novel Constructional Features.

With the submission of a Fisk detachable tire, the well known Chicopee Falls concern is certain to become more than ever a factor in the trade. Genuine novelty in the matter of construction marks the tire, in addition to the quality that has done so much to build up a reputation of the highest class for its makers.

It has been known for some little time that the Fisk Rubber Co., Chicopee Falls, Mass., was at work on a double tube, detachable tire, to supplement its offering of the well-known Fisk single tube tires. The growing demand for a tire that would be an easy riding one, and at the same time susceptible of quick and permanent repair on the road, was recognized, and plans laid to supply it. Such a tire, it was believed, should possess the same excellence of construction that has won for Fisk single tubes their popularity, as well as merits peculiar to detachable tires, but not always present in them.

All this has been accomplished in the double tube Fisk detachable vehicle tire here illustrated and now first shown. The entire air space in this tire is wholly above not only the rim, but also the entire clamping devices, thereby securing maximum action in the tire, as no portion of the air chamber is in any way confined.

The method of attaching used is entirely new and novel. It depends in no way upon the air pressure in the tire to hold it on to the rim, and under no conditions can it blow off from, or creep on, the rim until the clamping bolts shall have been removed. The tire is attached to a perfectly flat rim, which simplifies matters materially, both to the wheel manufacturer and the maker of complete automobiles. Simplicity is a quality which has been developed to the highest degree in this tire, and a glance at the cross section is sufficient to give a clear idea of the method of manipulation.

The design of the tire is such that the base or the beads are held in such a position that the inner tube cannot be pinched under any circumstances, and there is no chance even when handled by the most inexperienced of any mistake being made in attaching, or of the inner tube blowing out when the rings and bolts are once in place. These rings which hold the tires in place have an inside angle surface, and the tire is so designed that the beads play the part of an inside cone wedge, serving two purposes—first, of clamping the beads together, and, second, of locking the base of the tire firmly to the rim, and thereby preventing all danger of creeping.

By the use of this method of attaching, the necessity of using any heavy prying tools is done away with, and any one who can use an ordiary S wrench can attach and detach any sized tire with no exertion whatever, and in a very few minutes. Perhaps secondary to ease of riding, but certainly to an extent never before equalled, is the ease with which this tire can be removed from and replaced on the rim, and in view of the fact that all parts are visible during the operation there is no liability of failure. No experience is necessary, as was proven in Detroit a short time ago, when a boy who had never seen the tire, and with no instructions or having any one present, removed the tire from the rim, took out the inner tube, replaced and inflated in less than fifteen minutes.

The method of manufacture is such that the outer case, when off the rim, assumes the same position as when attached, which enables the operator to insert the inner tube without fear of its being misplaced, pinched or wrinkled while the tire is being attached.

The clamping bolts are designed with a threaded washer and checknut, removing thereby all liability of their working loose.

The material is identical with that used in the well-known and fully proven Fisk single tube tire, including the Fisk automobile fabric, a fact which renders no further comment upon quality and construction necessary.

The tire is fully protected by broad patents, both domestic and foreign.

Toledo Concern Erects a Building.

The Toledo Motor Carriage Co., now at Nos. 713 and 715 Jefferson street, Toledo, O., are having a large three story building put up for them, 44 feet front by 100 feet deep. It is the intention to have the salesroom on the first floor, and repair shop and storage room on the second floor. The third floor will be occupied by the Toledo Automobile Club.

The 1903 line will comprise the Baker, White, Electric Vehicle Co., Winton, Olds, Haynes-Apperson and International cars.

Mabbitt Opens Store at Rochester.

A. F. Mabbit, formerly of Bettys & Mabbit, cycle dealers, has opened an automobile store in Main street, Rochester, N. Y. He will take on the Century Motor Vehicle Co.'s line.

The Week's Exports.

Havre—Motor vehicles and material, 6 cases, $875.

ASSAILS COCKS LAW

Rochester Attorney Asserts its Inconstitutionality on Entirely new Grounds.

Again the malodorous Cocks law is attacked on the ground of unconstitutionality, it being contended that it discriminates against the citizens of unincorporated villages and towns.

The point, along with a number of others, was brought up last week at Rochester, N. Y., by counsel for Harry S. Woodworth, who appealed the case in which in May last Mr. Woodworth was convicted and fined for illegal speeding. Argument was heard before the Appellate Division, Horace McGuire representing the defendant.

The first point raised by Mr. McGuire was that the judgment was against the weight of evidence. He said that the people did not prove beyond a reasonable doubt that the defendant was guilty of the crime charged, and that he should have been discharged upon his motion to that effect.

"The people," he said, "to establish the fact that the defendant was guilty of the crime charged; that he operated an automobile on the highway in the town of Brighton at a greater rate of speed than twenty miles an hour, called several witnesses, who testified that they observed Mr. Woodworth and his automobile passing them upon the highway. These witnesses were asked for their opinion as to the rate of speed, and each gave his opinion based upon observation, and the opinions varied from twenty-five to fifty miles an hour. Some put it high and some put it low. They differed. At best their evidence was speculative, guesswork.

Mr. McGuire called attention to the evidence of the chauffeur, Charles R. Smith, who testified that with the lever in the "second speed ahead," the machine could not possibly travel faster than nineteen miles an hour, and that the lever was at no time operated in any notches other than the first and second "speed ahead," making it an impossibility for the automobile to go as fast as twenty miles an hour. John C. Ryan, formerly city engineer, testified to measurements and speed tests that were made under his direction, which showed that Mr. Smith's evidence was true.

"This unfairly discriminates against citizens of the State," said Mr. McGuire, "because it makes the incorporation of a village the test of criminality; that is to say, an act would be criminal if committed in an incorporated village, and the same would not be criminal if committed in an unincorporated village. Our contention is that this statute is unconstitutional because, instead of making the built up portions of the highway the test of criminality, it protects the people of an incorporated village to the exclusion of the citizens of unincorporated villages without regard to the built up portions thereof."

WHYS AND WHEREFORES.

(Continued from page 353.)

the time lost by all stops, there are in a few instances apparent discrepancies between the total time lost and the number of marks deducted. This is due to the rule that made any part of a minute cost one mark. Thus a car might have three stops of fifteen seconds, making a total of only forty-five seconds lost, and yet it would lost three marks, one for each stop. This is shown in the case of car C. 4., where 57 minutes were lost, but 58 points deducted. The cars that failed to finish do not figure in this summary.

There were eighty cars entered for the run. Seventy-five started and sixty-eight completed the trip. Seventeen cars had perfect scores, and tied for the president's cup. Three others that lost only one point each were awarded ~~respectively~~ the Scarritt, Chamberlin and Hill cups. Sixty-five machines won first class certificates, one earned a second class certificate and one a third class. Only one of the sixty-eight cars that finished failed to qualify for a certificate, and that was the Torbensen car, which averaged less than eight miles an hour.

An analysis of the total number of stops from all causes due to the mechanism of the car (and including tire troubles and stops for water and gasolene) of the sixty-seven cars receiving certificates is as follows:

GASOLENE CARS.

Forty-nine cars, six of which had no stops, the remaining forty-three having stops as follows:

	Per cent.
Ignition	26
Water circulation	11
Stalled motor	10
Tires	10
Valves	10
Accidental stops	6
Carburetter	5
Transmission gears	4
Springs	2
Gas connections	2
Out of gasolene	2
Lubrication	2
Wheel bearings	2
Chains	2
Clutch	2
Brakes	1
Broken piston	1
Crank shaft, muffler, ~~steering gear~~	2
	100

STEAM CARS.

Eighteen cars, one of which had no stops, the remaining seventeen having stops as follows:

	Per cent.
Water and gasolene	75
Tires	9
Air pressure (all in one car)	5
Water connections	3
Lighting fires	2
Low steam	1
Water-glass	1
Lubrication	2
Brakes, chain, gasolene connections	2
	100

Seven cars withdrew from the contest for the following reasons:

B-6 Foster—Broken crank shaft.
B-14 Autocar—Damaged gear shaft.
B-15 Ward-Leonard—Jaw couplings between engine and speed gear broken; crank shaft bent.
C-50 Neftel—Defective water circulation; hot engine.
A-54 DeDion-Bouton—Broken steering gear.
B-69 Fredonia—Damaged transmission gear.
A-74 Buffalo—Broken connecting rod.

The summary follows:

C. 1., Packard 24 h.p. G. tonneau, 3955 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, 3; 1 min., 31 sec.; recovering hat, two punctures. Control repairs, 4; Oct. 11, straightening spring, tightening clutch and new spark plug; Oct. 12, new clutch lever; Oct. 14, fixed joint of oil pump; Oct. 9, new tire.

C. 2., Packard 12 h.p. G. tonneau, 2615 lbs., 2089 marks—Penalized stops, 1; 3 min.; tightening clutch. Non-penalized stops, 6; 14 min., 45 sec.; Nature, R. R. crossing, Nature, wraps and Nature, R. R. crossing, Nature. Control repairs, none.

C. 3., Packard 12 h.p. G. tonneau, 2690 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, none. Control repairs, 2; Oct. 9, fixed brake cable; Oct. 14, new brake cable.

C. 4., Packard 12 h.p. G. tonneau, 2510 lbs., 2034 marks—Penalized stops, 3; 57 min.; covering contact points, cleaning contact points, fixing intake valve. Non-penalized stops, 5; 11 min., 45 sec.; blocked traffic, recovering seat cushion, blocked traffic, blocked by R. R., pumping tire. Control repairs, 5; Oct. 10, fixed contact spring and throttle regulator; Oct. 11, adjusted oil pump; Oct. 13, changed battery connections; Oct. 15, brightened contact points; Oct. 14, new inner tube for tire.

B. 5., Prescott, 4½ h.p. S. runabout, 1435 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, 8; 29 min.; all for water. Control repairs, 4; Oct. 9, lubricated engine; Oct. 10, cleaning thumb nuts; Oct. 12, adjusted chain strut rod; Oct. 14, adjusted chain strut rod.

B. 7., Lane, 9 h.p. S. runabout, 1790 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, 14; 33 min.; ten for water, three for R. R. crossing, one for Nature. Control repairs, none.

B. 8., Lone 9 h.p. S. surrey, 1690 lbs., 2085 marks—Penalized stops, 2; 7 min.; replaced pin valve stem of cylinder lubricator, tightened union in water pipe. Non-penalized stops, 11; 1 hr., 4 min.; all for water. Control repairs, 1; Oct. 12, new tire.

C. 10., Haynes-Apperson 9 h.p. G. surrey, 2140 lbs., 2077 marks—Penalized stops, 2; 14 min.; replacing broken chain, new ignition pin and lubrication. Non-penalized stops, 4; 48 min., 5 sec.; Nature, blocked traffic, blocked by R. R., new inner tire tube. Control repairs, none.

B. 11., Haynes-Apperson 9 h.p. G. single seater, 1945 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, 1; 5 sec.; traffic. Control repairs, none.

B. 12., Haynes-Apperson, 6 h.p. G. runabout, 1370 lbs., 1910 marks—Penalized stops, 2; 3 hrs., 1 min., 30 sec.; funnel fell against magneto and closed circuit, repaired spring hangers and center swivel damaged by running into ditch to avoid collision. Non-penalized stops, 4; 7 min., 30 sec.; R. R. crossing, recovering hat, blocked traffic, recovering extra tire. Control repairs, 4; Oct. 13, fixed first speed clutch; Oct. 13, fixed clips on spring; Oct. 11, new tire; Oct. 14, found nails in tires, but no leaks.

B. 13., Autocar 10 h.p. G. single seater, 1610 lbs., 2083 marks—Penalized stops, 1; 9 min.; chain off pump. Non-penalized stops, 4; 28 min.; blocked traffic, Nature, Nature, Nature. Control repairs, none.

B. 16., Ward-Leonard 15 h.p. G. two-seater, 1875 lbs., 1974 marks—Penalized stops, 12; 1 hr., 30 min., 35 sec.; new spark plug, fixed intake valve, new valve key, valve trouble, changed battery, adjusted bearings, oil valve in motor case opened and motor stopped, accidentally opened igniter switch, motor stopped while running in ditch to pass steam roller, cleaned spark plug, closed oil valve, cleaned spark plug. Non-penalized stops, 4; 1 hr., 35 min.; R. R. blocked, traffic blocked, Nature, repairing tire. Control repairs, 4; Oct. 15, cleaned spark plug; Oct. 13, repaired tires; Oct. 14, repaired tire; Oct. 15, repaired tire. Marks lost at controls—early, 5; late, 19.

C. 17., Apperson 16 h.p. G. touring car, 2580 lbs., 2070 marks—Penalized stops, 1; 22 min.; repairing brake. Non-penalized stops, 6; 9 min., 5 sec.; R. R. crossing, Nature, blocked traffic, recovering hat, R. R. crossing, Nature. Control repairs, 2; Oct. 11, repacking water pump; Oct. 12, water leak soldered.

C. 18., Brazier 15 h.p. G. tonneau, 2850 lbs., 1893 marks—Penalized stops, 9; 4 min., 30 sec.; motor stalled seven times, clutch stuck, intermediate gear on pump shaft stripped and was towed into Worcester. Non-penalized stops, 5; 3 min., 23 sec.; blocked traffic five times. Control repairs, 7; Oct. 10, fixed loose screw of speed clutch; Oct. 11, adjusted speed lever; Oct. 13, replaced broken gear; Oct. 14, wired water cooler, new spark plug, new nuts on gear case, cleaned oil pump; Oct. 14, fixed broken wagon spring; Oct. 15, cleaned admission valves, adjusted speed clutches and spark coils, new spark plug; Oct. 15, adjusted sparking apparatus. Marks lost at controls—towed into Worcester, 191.

A. 19., Torbensen 5 h.p. G. runabout, 990 lbs., 1216 marks—Penalized stops, 32; 5 hrs., 13 min., 30 sec.; fixed broken wire six times, fixed vibrator six times, ten stops due to sparking trouble, loose water connection, water, plug fouled, intake valve broken twice, carburetter stopped, water pipe and spark trouble, new battery, broken water connection, broken steering knuckle. Non-penalized stops, 9; 1 hr., 14 min., 15 sec.; Nature, Nature, frightened horse, R. R. crossing, lighting lamps, puncture, pumping tire, puncture, tire burst and machine climbed sidewalk, wrecking a wheel. Control repairs, 5; Oct. 10, pump connections and vibrator cleaned; Oct. 11, new intake valve and spark plug; Oct. 12, loose plug in cylinder head; Oct. 13, new spark coil and cable; Oct. 14, lengthened clutch rod. Marks lost at controls—late, 16; missed control, 191; late, 59; missed control, 223; late, 2; late, 50.

A. 20., Pierce 4½ h.p. G. motorette, 832 lbs., 2088 marks—Penalized stops, 1; 4 min.; cleaning spark plug. Non-penalized stops, 4; 12 min., 30 sec.; Nature, pumped tire three times. Control repairs, 10; Oct. 10, adjusted crank shaft bearings, adjusted trembler and oiled transmission gear; Oct. 11, cleaned spark plug; Oct. 11, adjusted spark plug; Oct. 13, adjusted spark plug and trembler and oiled gears; Oct. 13, adjusted spark plug and oiled up; Oct. 14, cleaned spark plug; Oct. 14, new spark plug; Oct. 15, new spark plug; Oct. 15, new spark plug.

B. 21., Darracq 12 h.p. G. tonneau, 1612 lbs., 2091 marks—Penalized stops, 1; 30 sec.; put on emergency brake suddenly to avoid gully and engine stopped. Non-penalized stops, 3; new inner tube for tire, replacing tire, pumping tire. Control repairs, 3; Oct. 10, new inner tube; Oct. 11, new inner tube; Oct. 13, new inner tube.

C. 23., Apperson 16 h.p., 2690 lbs., 2021 marks—Penalized stops, 4; 1 hr., 9 min., 9 sec.; clutch loosened twice, repairing pump and water coils, repairing circulation pump. Non-penalized stops, 3; 12 min., 40 sec.; lighting lamps, recovering lamp top, R. R. crossing. Control repairs, 2; Oct. 11, adjusted speed change; Oct. 13, fixed circulating pump.

B. 24., White 6 h.p. S. stanhope. 1505 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, 2; 24 min.; water, fixing tire. Control repairs, 4; Oct. 13, tightened chain and set up stuffing boxes; Oct. 14, opened fire regulator, cleaned gasolene pipe and tightened joint in vaporizer; Oct. 15, opened fire regulator.

B. 25., White 6 h.p. S. stanhope, 1475 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, none. Control repairs, none.

B. 26., White 6 h.p. S. stanhope, 1675 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, none. Control repairs, none.

B. 27., White 6 h.p. S. Stanhope, 1675 lbs., 2092 marks—Penalized stops, none. Non-

Digitized by Google

penalized stops, 1; 8 min.; replenished water that jolted out. Control repairs, 8; Oct. 9, 10, 11, 13, 14, 15, cleaned condenser sponge; Oct. 14, cleaned water tank; Oct. 15, replaced tire.

B. 28., White 6 h.p. S. delivery wagon, 1690 lbs., 2088 marks—Penalized stops, 1; 4 min.; steam pressure too low. Non-penalized stops, 4; 1 hr., 50 min., 15 sec.; R. R. crossing, puncture, pumping tire, new inner tube. Control repairs, Oct. 11, new plunger in air pump; Oct. 13, new inner tube; Oct. 13, fixed tire.

C. 29., Locomobile 12 h.p. G. touring car, 2340 lbs., 1895 marks—Penalized stops, 2; 15 min., 15 sec.; broken intake valve, changing gears. Non-penalized stops, 7; 24 min., 45 sec.; blocked traffic, rendering aid after accident, blocked traffic, Nature, lighting lamps, lighting lamps, recovering cap. Control repairs, 7; Oct. 10, cleaned governor valve; Oct. 11, new exhaust valve; Oct. 13, new spark plug, and cleaned admission valve; Oct. 13, new spark plug; Oct. 14, new spark plug; Oct. 14, sheared off six bolts in bevel gears and put on new brake shoe; Oct. 15, two new spark plugs and one new brake band. Marks lost at controls—les sthan eight miles an hour, Hartford to New Haven, 181.

B. 30., Stevens 6 h.p. G. runabout, 1155 lbs., 2091 marks—Penalized stops, 1; 30 sec.; neglected to open cock between gasolene tank and carburetter. Non-penalized stops, 4; 3 min., 9 sec.; R. R. crossing, traffic blocked three times. Control repairs, 2; Oct. 9, pushed gear case back to prevent rattle; Oct. 15, new tire.

B. 31., Stevens 6 h.p. G. runabout, 1180 lbs., 2073 marks—Penalized stops, 1; 10 min.; broken chain. Non-penalized stops, 2; 5 min.; R. R. crossing, Nature. Marks lost at controls—early, Oct. 15, 9.

B. 32., Rambler 6 h.p. G. runabout, 1112 lbs., 2088 marks—Penalized stops, 2; 3 min., 30 sec.; dust-clogged vibrator, hot engine. Non-penalized stops, 4; 7 min., 5 sec.; Nature, R. R. crossing, R. R. crossing, blocked traffic. Control repairs, 1; Oct. 11, adjusted chain.

B. 33., Grout 6½ h.p. S. touring car, 1130 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, 10; nine for water, one for train. Control repairs, 4; Oct. 11, adjusted chain and tightened brake; Oct. 14, new water glass; Oct. 14, cleaned check to cylinder lubricator; Oct. 15, repaired iron body hanger.

C. 34., Locomobile 10 h.p. S. touring car, 3030 lbs., 2022 marks—Penalized stops, 1; 1 hr., 10 min.; new valve in top of water pump. Non-penalized stops, 23; 5 hrs., 52 min., 30 sec.; fifteen stops for water, four new inner tubes for same tire; two frightened horses, blocked traffic; Nature. Control repairs, 2; Oct. 11, new water glass; Oct. 15, cleaned boiler gauge and adjusted pump rod.

B. 35., Locomobile 4 h.p. S. runabout, 1210 lbs., 2091 marks—Penalized stops, 1; to light fire. Non-penalized stops, 13; eleven for water, one for gasolene, one for pumping tire. Control repairs, 4; Oct. 13, piston packed; Oct. 14, new connecting rod; Oct. 15, piston packed; Oct. 11, two new tires.

B. 36., Locomobile 4 h.p. S. runabout, 1215 lbs., 1848 marks—Penalized stops, 1; towed into finishing control at N. Y., water having given out. Non-penalized stops, 20; 2 hrs., 49 min., 17 sec.; eleven stops for water, six stops for Nature, R. R. crossing, gasolene, tire valve leaking. Control repairs, 9; Oct. 10, lubricated and adjusted; Oct. 10, took water and pumped air; Oct. 11, repaired and cleaned pump oil cup; Oct. 12, fixed oil cup of air pump and put in small piece of piping; Oct. 13, cleaned and lubricated; Oct. 13, lubricated and took water; Oct. 14, lubricated and took water; Oct. 15, lubricated; Oct. 15, new tire. Marks lost at controls—late at Hartford, 15; late at Springfield, 7; early at Worcester, 2; late at Springfield, 30; towed to finish, 190.

B. 38., Elmore 5 h.p. G. runabout, 1280 lbs., 2030 marks—Penalized stops, 70; 51 min., 59 sec.; one cylinder missed fire, rubber apron blew into speed clutches three times, engine heated up three times because of leak in radiator. Non-penalized stops, one; few seconds to recover cap. Control repairs, 5; Oct. 10, oiled up; Oct. 11, oiled and adjusted and shortened brake rod; Oct. 12, tightened chain, examined pumped a tire. Marks lost at controls—late at N. Y., 9.

B. 39., De Dion-Bouton, France, 8 h.p. G. tonneau, 1395 lbs., 2082 marks—Penalized stops, 4; 12 min., 31 sec.; sooty plug, tightened inlet valve, broken trembler, adjusted inlet valve. Non-penalized stops, 1; 3 min., 35 sec.; open drawbridge. Control repairs, 1; Oct. 10, new inner tube for tire.

B. 40., Autocar 10 h.p. G. two-seater, 1430 lbs., 1867 marks—Penalized stops, 5; 3 hrs., 26 min.; vaporizer flooded, broken stopcock let out gasolene, gasolene feed tube broken, broken wire and friction pulley to pump, overheated engine. Non-penalized stops, none. Marks lost at controls—early at Worcester, 19.

A. 41., Oldsmobile 4 h.p. G. runabout, 860 lbs., 2070 marks—Penalized stops, 5; 21 min., 5 sec.; broken gasolene pipe to mixer and sulphured clutch, pump troubles, operator's sleeve shut off spark, water in carburetter, broken wire. Non-penalized stops, none. Control repairs, 7; Oct. 9, link removed from chain and clutch tightened; Oct. 10, replaced cylinder head gasket; Oct. 11, the same; Oct. 11, adjusted vibrator and cleaned contacts; Oct. 12, replaced cylinder head gasket; Oct. 13, adjusted vibrator; Oct. 15, adjusted vibrator, cleaned carburetter and repaired brake.

C. 42., Fournier-Searchmant 8 h.p. G. tonneau, 2200 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, 10; 20 min., 1 sec.; blocked traffic twice, Nature five times, frightened horse, blocked by R. R. train drawbridge open. Control repairs, 7; Oct. 10, examined spark plug and inlet valve; Oct. 12, ground exhaust valves and cleaned spark plugs; Oct. 13, examined float chamber, added tension to commutator spring and cleaned contact points; Oct. 14, cleaned contact points; Oct. 15, cleaned contact points; Oct. 10, pumped tire; Oct. 11, pumped tires.

C. 43., Packard 12 h.p. G. tonneou, 2600 lbs., 1815 marks—Penalized stops, 13; 4 hrs., 58 min., 50 sec.; leak in water system, ignition troubles, lubricator, broken wire, gas feed choked, fixed carburetter float and adjusted chain, gears examined, hot box and bearing cup broken and spring leaves out of bearing cup broken and spring leaves out of line; same thing again, motor stopped, spark trouble, short circuit, ball bearing broken. Non-penalized stops 2; 2 min., 15 sec.; road blocked, Nature. Control repairs, 5; Oct. 12, changed cells of battery and tightened hub dust cap; Oct. 13, cleaned carburetter; Oct. 13, new bolt in strut rod of chain; Oct. 14, bolt drilled out of strut rod and new one put in; Oct. 15, new cone in front wheel. Marks lost at controls—early at Norwalk, 14; less than eight miles an hour between New Haven and Norwalk, 148.

B. 44., Darracq 16 h.p. G. tonneau, 1885 lbs., 1262 marks—Penalized stops, 4; 1 hr., 10 min., 12 sec.; short circuit, broken spark connection, gasolene feed blocked, sooty plug. Non-penalized stops, 1; R. R. crossing. Control repairs, 5; Oct. 9, new front spring, new inlet valve, valves ground and plug cleaned; Oct. 12, took in gasolene; Oct. 13, plugs cleaned and new connection to plug; Oct. 14, cracked body spring fixed; Oct. 15, fixed lamp bracket. Marks lost at controls—missed control N. Y. to Norwalk, 190; missed control Norwalk to New Haven, 148 marks; missed control Springfield to Worcester, 223; Missed control Worcester to Boston, 191; early at Norwalk, 6.

B. 37., Elmore 5 h.p. G. runabout, 1220 lbs., 2087 marks—Penalized stops, 1; 5 min.; to open holes in muffler. Non-penalized stops, none. Control repairs, 3; Oct. 10, tightened bolts of cylinder head; Oct. 11, the same; Oct. 13, tightened connecting rod of one motor.

B. 45., Franklin 8 h.p. G. roadster, 1150 lbs., 2086 marks—Penalized stops, 3; 4 min., 45 sec.; spark failed, spark failed, engine stalled. Non-penalized stops, none. Control repairs, 13; Oct. 9, inspection; Oct. 10, cleaning; Oct. 10, inspection; Oct. 11, cleaning; Oct. 11, cleaning and inspection; Oct. 12, cleaned and adjusted; Oct. 13, inspection; Oct. 14, cleaning; Oct. 14, two new cells; Oct. 15, inspection; Oct. 15, adjust spark plug and tightened belt on magneto; Oct. 14, set up igniter spring; Oct. 9, ment; Oct. 10, new tire shoe; Oct. 12, new tire shoe.

B. 46., Knox 8 h.p. G. single-seater, 1465 lbs., 1798 marks—Penalized stops, 1; broke crank shaft. Control repairs, 6; Oct. 9, new oil cup on cylinder; Oct. 10, tightened chain and coupling of gasolene feed pipe; Oct. 11, tightened crank pin box and took up high speed clutch; Oct. 14, tightened chain; Oct. 14, reset ignition cam; Oct. 15, adjusted conreset ignition cam; Oct. 15, adjusted contact points. Marks lost at controls—missed control New Haven to Hartford, 180; missed control Hartford to Springfield, 113.

B. 47., Knox 8 h.p. G. single-seater, 1435 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, 1; slowed down for blocked street and accidentally stalled motor. Control repairs, 3; Oct. 10, tightened belt on fan; Oct. 11, oiled and adjusted; Oct. 14, adjusted connecting rod and ground exhaust valve.

B. 48., Knox 8 h.p. G. single-seater, 1425 lbs., 2091 marks—Penalized stops, 1; 20 sec.; stalled motor. Control repairs, 5; Oct. 10, adjusted vibrator; Oct. 11, adjusted vibrator, fixed crank pin and cleaned spark plug; Oct. 13, fixed crank pin; Oct. 13, resin on fan belt; Oct. 14, tightened chain, set up nuts.

B. 49., Fiat 12-16 h.p. G. tonneau, 1920 lbs., 1812 marks—Penalized stops, 1; 1 hr., 15 min.; repairing gear case and adjusting valves and magneto. Non-penalized stops, 3; 40 sec.; lighting lamps, blocked traffic, took wrong road because of arrows being down. Control repairs, 6; Oct. 10, engine oiled and fan belt tightened; Oct. 11, gear case repaired and adjustments made; Oct. 13, inlet valves adjusted; Oct. 14, temporary repairs to one spring; Oct. 15, gear case repaired; Oct. 11, new inner tube. Marks lost at controls—late at Boston, 15; missed control Norwalk to New York, towed in to finish, 190.

B. 51., Stearns 8 h.p. S. touring car, 1620 lbs., 2027 marks—Penalized stops, none. Non-penalized stops, 23; 1 hr., 39 min., 15 sec.; all stops made for water. Control repairs, 4; Oct. 9, new nipple safety valve cock; Oct. 10, new bolt compensating gear cover and new water glass; Oct. 12, repaired mud guard and tightened up stuffing boxes; Oct. 15, fixed sight feed lubricator and put clip on side box. Marks lost at controls—early at Norwalk, 9; early at New Haven, 3; early at Hartford, 10; early at Worcester, 9; erly at Boston, 12; early at Worcester, 8; early at Springfield, 10; early at Norwalk, 4.

C. 52., Winton 15 h.p. G. tonneau, 2300 lbs., 2090 marks—Penalized stops, 2; 30 sec.; stalled on hill, flooded carburetter. Non-penalized stops, 1; adjusting lap robe. Control repairs, 3; Oct. 10, pumped tire; Oct. 13, pumped tire twice.

B. 55., Long Distance 7 h.p. G. runabout, 1570 lbs., 2090 marks—Penalized stops, 1; 2 min.; oiling. Non-penalized stops, 4; 3 min., 25 sec.; recovered lost hat twice, R. R. crossing twice.

B. 56., Long Distance 7 h.p. G. runabout, 1610 lbs., 1918 marks—Penalized stops, 10; 2 hrs., 19 min., 15 sec.; water, cooling motor, cooling motor, examining front axle, fixed broken steering knuckle, blew out valve packing, hot motor, bumper under spring fell out, tightened inlet pipe, replacing wooden bumper. Non-penalized stops, 1; 3 min.; Nature. Control repairs, 4; Oct. 10, inspected crank case; Oct. 12, straightened axles and fixed bearings of engine; Oct. 14, tightened nuts; Oct. 15, replaced wooden bumper under broken spring. Marks lost at controls—late at Norwalk, 32.

A. 57., Pierce 5 h.p. G. motorette, 837 lbs., 2085 marks—Penalized stops, 1; 7 min.; replaced broken inlet valve stem. Non-Penalized stops, 4; 1 min., 45 sec.; three stops at R. R. crossings, one for frightened horse. Control repairs, 6; Oct. 10, cleaned spark plug; Oct. 10, same; Oct. 11, same; Oct. 11, new spark plug and tightened high speed clutch; Oct. 13, cleaned plug; Oct. 14, same.

A. 58., Rambler 4 h.p. G. runabout, 1100 lbs., 2022 marks—Penalized stops, 12; 51 min.,

Commentary

Supposing you had a fine looking horse, one who was all right in every way, only he would occasionally bite off a groom's arm or else deftly kick his brains out—do you think it would add to your chance of selling the animal if, when you came to advertise him, you offered in your advertisement to present the purchaser with a steel muzzle and an anti-kicking harness? Don't you think the possible buyer might be inclined to think your desire to sell your horse and to give away such peculiar equine toilet articles as a bit suggestive? Seems to me that is the way I would look at it, but I suppose I must be an unusually suspicious soul, because evidently other people haven't the same ideas, or else this advertisement would never have appeared in Sunday's paper:

"FOR SALE—10 H. P. 4 Cylinder P—— Car, in Perfect Running Order; Practically New, with full equipment, lamps, tools, baskets, spare parts, &c.; also $10,000 Accident Policy and $5,000 Insurance Policy; owner's sole reason for selling is on account of going abroad."

Don't it strike you that it would have been money saved and suspicion unaroused if the owner, when writing this advertisement, had temporarily forgotten about those two insurance policies?

* * *

There are always two sides in any argument regarding the building, designing or using of a motor vehicle—the wrong side and our side.

* * *

It must be very annoying when one is fishing for suckers and when equipped with tackle only of a strength sufficient to land these soft marks of angling to suddenly find you have hooked a whale who declines either to unhook himself or to allow you to do it for him. This predicament was the one that the rural road officers and their side partner, the justice of the peace, recently found themselves in down on Long Island. They had hooked a big semi-racing car and had attempted to land the driver for the usual shakedown, to be divided between the constables arresting and the judge trying the accused automobilist. After the prisoner was given a chance to tell who he was it dawned upon the conspirators that they had hooked onto a whale. The accused was a big politician and a millionaire with a political and financial pull bigger than a Brooklyn bridge cable.

The case was hastily adjourned by the justice and an attempt was made to get the accused to admit he had been violating the speed ordinances, as the Waterbury-holding constable had taken his solemn oath he had seen him "wilfully" do. The automobilist said he wasn't guilty, wouldn't pay, and if he was fined or annoyed he'd take the case and those responsible for it to a court where shakedowns were not recognized. Then there was more trouble in the camp of the sucker catchers. Nobody knows what might have happened had not the justice, in reading over the charges, discovered that the automobilist was charged by the Waterburyer with having "wilfully" driven faster than the law allowed. There was a hole for the judge and his partners to crawl through. It was a small hole, but in such cases Long Island judges and janissaries feel pretty small themselves, so they crawled. The judge said it was not proven that the accused was "wilfully" guilty, so the case was quashed. Thus it comes to pass that Mr. Cord Meyer, politician and man of affairs, was not a contributor to the Christmas spending money of one Long Island justice and one Long Island constable.

* * *

It is positively surprising how many things about an automobile some people do not learn from experience.

* * *

The more I watch automobile users the less I am able to understand why the possession or the driving of a motor vehicle seems instinctively to rob one of all pride of appearance; that "something" that makes and marks the aristocracy of the horse. Take the picture presented by a well groomed man—and you never saw any other kind—driving a tandem or a four-in-hand, and, no matter what you may say, you know that the whole affair, from the well oiled hoofs of the satin-skinned animals to the silken lash of the well poised whip, is the height of what for lack of a better name is termed "good form."

Now take an automobile. Let it be the finest money can buy and the driver of it the very same man, if you will, whom you so admired when he tooled the four-in-hand or the tandem team, and what is the difference? Just about the same that there is between the occupant of the box seat on a four-in-hand and the occupant of the engineer's seat in the cab of a locomotive, I should say. But why? I don't know, but if you can tell me I'll be glad to make the secret one no longer. As it is, I have tried to figure the thing out until I am tired, and so I turn the job over to you, if you want it.

* * *

After you start in to purchase automobile experience you will generally find that what you buy is not of the same quality as the sample you selected it by.

* * *

Horse sense is a peculiar and very uncertain thing. Some high-strung animals apparently cannot become reconciled to the sight of any moving vehicle which is independent of their aid, while others shy when they see a silent and motionless vehicle at the curb. A mounted policeman, who, with myself, formed a part of the audience which a disabled touring car had attracted upon Jerome avenue recently, told me when we got to talking about this that he believed that horses which were thus frightened became so through failing to see any pole or shafts in front of the new vehicle. I failed to get any facts from him which would seem to substantiate his theory, and he confessed he hadn't any except that his observation had led him to believe as he did.

* * *

It is a remarkable fact that when it comes to running a motor vehicle the man who knows all about it usually disagrees with the other man who knows all about it. Ever notice that?

* * *

Of course, I know it is an impertinence to even think of such a thing, but even so, I certainly would like to know what the real rock-bottom price is on some vehicles. I got a letter recently from a concern, or rather from an officer thereof, offering me a 25 per cent commission on every automobile made by his concern that I was instrumental in selling. All I was expected to do was to tip off the offer-maker whenever I learned of any one who was inclined to purchase a motor vehicle. After that the concern was to do the rest, and me, too, I suppose. Now, if a rank outsider like I am can, without even asking for it, get a rake-off of one-quarter of the price, what do you suppose an insider with a pull and the inclination to exert it could get?

* * *

"She's sulky and won't do herself justice. We might just as well turn around and try to get home before she refuses to move at all." This was what a friend of mine said who had taken me out in a big touring car he owned, and of which he was very proud, hence anxious to have it do its best. The "she" was, of course, the car. It really did seem as though the big conveyance was protesting in every way possible against doing what was expected of it. All pleasure of riding was absent, and I myself felt in an indefinable way that the harmony between the driver and the driven was lacking. The experience was not by any means a new one, however. There can be no denying that there is a peculiar affinity between an automobile and its driver. There are days when the two seem to work in perfect unison, each a part of a complete mechanism. There are other days when either the driver or the vehicle is out of harmony. Others there are when both are unattuned. I am not sure just which condition prevailed on the occasion I am writing about, but I know "she" quit dead just after we had passed over Central Bridge on our way back, and we sat on the dead one like a coroner's jury for more than an hour before the man we had telephoned the storage station for arrived, and with a strong arm and equally strong language banged "her" into submission. She carried us back to the storage place, but she creaked and groaned and snorted and spluttered so that you had no difficulty in discovering that it was no willing service which "she" was rendering.

THE COMMENTATOR.

BRITISH CLUB PREPARES

Adopts Rules Governing Preliminary Bennett Cup Trials—Two Napiers Selected.

While the search for a suitable road in Ireland on which to run the Bennett Cup race is still being prosecuted by the Automobile Club of Great Britain, the latter has gone ahead and arranged for the selection of a team to represent it. The formal challenge from the Automobile Club of France has already been received.

It has been decided that two Napier cars shall be entered by their makers; but in doing so the club records that they do not wish it to be taken as a precedent by which the winner of the Gordon Bennett race in one year should claim the right to enter two cars in the following year.

Having thus decided as to two of the three cars, the committee have laid down conditions as to an eleminating test for the third car. Their makers will have to contribute at the rate of $250 per car toward the cost of organizing the race, which will be run on a mile track and on a hill—the location of both to be announced later.

This eliminating test will consist of three runs down (the time to be taken over the flying kilometre); three runs up (the time to be taken over the flying kilometre); three runs down (time to be taken over the standing mile); three runs up (time to be taken over the standing mile), and three times up the hill.

To arrive at the results there will be ascertained (1) the mean speed made over the six journeys over the flying kilometre, and from this will be calculated how long the car would take, travelling at that mean speed, to complete twelve miles. (2) There will also be ascertained the average speed made by the car on the six journeys over the standing mile, and from this will be calculated how long the car would have taken in covering three miles at that average speed. (3) From the records made in the three ascents of the hill it will be ascertained what was the average speed, and from this will be calculated what would be the time occupied, when travelling at this average speed, in covering one mile. The total time which would be occupied in covering the sixteen miles above referred to will thus be ascertained, and the car which proves to have been the fastest over the sixteen miles will be the winner.

Entries for the elimination race must be made before noon on December 8, each entry to be accompanied by a check for $2,500. If a car entered is not at the appointed place by an hour to be stated on April 10, or any subsequent date which may be fixed by the committee, the $2,500 will be forfeited.

CUP RULES CHANGE

Methods of Starting and Finishing, and a few Other Details Altered.

It appears that the Bennett Cup rules now in the possession of the Automobile Club of America are the original set adopted by the French club, and not the revised set. A couple of important amendments have been made to the first lot of rules, and the French organization has been dilatory about forwarding these amendments. The tenor of them, however, is known. Rule 7, the original reading, as published last week in the Motor World, fixes only a minimum limit of weight of 400 kilogrammes (882 pounds), but this has been amended so as to read that the cars shall weight not less than 400 kilos, nor more than 1,000 kilos, the maximum limit being equivalent to 2,205 pounds.

Rule 13 has been amended so that instead of calling for the vehicles to be started simultaneously, it requires that they shall be started two minutes apart. Rule 14 has been changed so as to conform to the plan of starting. The altered rule, instead of reading that the first machine to cross the line of finish shall be declared the winner, says that the machine which makes the best time shall be the winner.

BUILT TO CARRY THREE TONS OF ROOFING MATERIAL.

Pressed Into Coal Delivery Service.

A surplus of snow on the streets, combined with a shortage of coal and coal carts, were the conditions on last Sunday that made the Hudson Coal Co., of Jersey City, a convert to the automobile. It borrowed an electric truck, which was built to haul only three tons of roofing material, and loaded it with five tons of coal to be taken to New York. The roofing truck hauled its excess load all right, and before the day was over had made three trips between the two cities and delivered fifteen tons of coal. The next day the coal company placed an order for three trucks.

One of the Societe Electromotion's electrical vehicles was recently driven from Paris to Vernon and back, a distance of ninety-four miles, on one charge of the battery, which comprised ninety-six cells of the Phoenix type.

WHYS AND WHEREFORES.

(Continued from 361.)

15 sec.; battery, water, ignition, gasolene, engine stopped, setting valve, setting valve, engine stopped, ignition, ignition, commutator cleaned. Non-penalized stops, 9; 11 min., 25 sec.; picked up hat five times, traffic blocked, Nature, R. R. crossing. Control repairs, 9; Oct. 9, cleaned plug; Oct. 10, cleaned plug and adjusted igniter; Oct. 10, vibrator adjusted and new battery put in; Oct. 11, the same; Oct. 11, cleaned valves; Oct. 13, new coil and new spark plug; Oct. 13, new battery, carburetter and cam fixed; Oct. 14, adjusted vibrator and set up nuts; Oct. 15, vibrator and tightened chain.

C. 59., Winton 16 h.p. G. touring car, 2340 lbs., 2074 marks—Penalized stops, 5; 15 min., 31 sec.; spark, spring troubles, trembler, new trembler spring, new trembler spring. Non-penalized stops, 8; 1 hr., 10 min., 12 sec.; open drawbridge, Nature, Nature, getting cap, R. R. crossing, hat off, tire trouble, tire burst. Control repairs, 6; Oct. 10, broken steering head; Oct. 10, new pin in pump pinion and adjusted spark plug; Oct. 11, pin in pump pinion; Oct. 12, cleaning and replacing parts; Oct. 13, strengthening steering head with clamps; Oct. 14, two new tires.

B. 60., Grout 6½ h.p. S. touring car, 1145 lbs., 2087 marks—Penalized stops, 1; 5 min.; replaced water glass. Non-penalized stops, 12; 1 hr., 35 min.; all for water. Control repairs, 4; replaced water glass four times; Oct. 11, twice, 14 and 15.

B. 61., Grout 6½ h.p. S. touring car, 1100 lbs., 2081 marks—Penalized stops, 2; 9 min., 35 sec.; put in water glass, low steam on hill. Non-penalized stops, 13; 1 hr., 11 min., 48 sec.; ten stops for water, two for R. R. gates, one for blocked road. Control repairs, 4; Oct. 9, water glass replaced; Oct. 10, brake rod and chain tightened; Oct. 12, the same; Oct. 14, chain tightened.

C. 62., International 16 h.p. G. touring car, 2915 lbs., 2079 marks—Penalized stops, 4; 8 min.; spark failed twice, put in new plug twice. Non-penalized stops, 2; 2 min., 20 sec.; traffic blocked, Nature. Control repairs, 4; Oct. 9, two new spark plugs; Oct. 11, three new spark plugs; Oct. 15, repaired governor; Oct. 14, new inner tube. Marks lost at controls—early at Springfield, 4.

A. 63., Oldsmobile 4 h.p. G. runabout, 945 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, 2; 3 min., 30 sec.; open drawbridge, motor stopped by sudden swerve to avoid collision. Control repairs, 2; Oct. 13, adjusted chain; Oct. 15, tightened high speed clutch.

A. 64., Oldsmobile 4 h.p. G. runabout, 920 lbs., 2088 marks—Penalized stops, 1; 5 sec.; carburetter flooded. Non-penalized stops, 2; 6 min.; drawbridge open, blocked traffic. Control repairs, 3; Oct. 10, 14, 14, tightened chain. Marks lost at controls—early at Worcester, 3.

B. 65., Automotor 12 h.p. G. touring car, 1550 lbs., 2044 marks—Penalized stops, 4; 37 min.; tightened bolt on gear drive twice, replaced pin on pump, adjusted commutator chain. Non-penalized stops, 1; 30 sec.; R. R. crossing.

C. 66., Panhard 12 h.p. G. tonneau, 2790 lbs., 2082 marks—Penalized stops, 1; 10 min., repaired pump wheel. Non-penalized stops, 4; 2 hrs., 3 min., 35 sec.; open drawbridge, three tire repairs.

C. 67., Fournier-Searchmont 10 h.p. G. tonneau, 2610 lbs., 2092 marks—Non-penalized stops, 2; 34 min., 15 sec.; hat fell in sprocket and bent countershaft rod, chain broke. Control repairs, Oct. 11, new pin in brake band.

B. 68., Fredonia 9 h.p. G. runabout, 1400 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, 3; 1 min., 30 sec.; R. R. crossing, Nature, puncture. Control repairs, 4; Oct. 13, tightened chain; Oct. 10, new inner tube; Oct. 11, new tire; Oct. 14, repaired puncture.

B. 70., Foster 4 h.p. S. touring car, 1500 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, 24; ten for water, R. R. crossing, recovering record book, blocked traffic, R. R. crossing, rain coat and lighting lamps, R. R. crossing, Nature, fixed tire that pulled off six times, pumped tire. Control repairs, 1; new tire.

A. 71., French De Dion-Bouton 6 h.p. G. motorette, 920 lbs., 1885 marks—Penalized stops, 5; 21 min., 30 sec.; new spark plug, motor stalled, broken transmission gear, repaired spark plug, broke piston. Non-penalized stops, 1; blocked traffic. Control repairs, 3; Oct. 10, cleaned plug, trembler and inlet valve; Oct. 15, new piston, and new bushing at crank end; Oct. 15, repaired broken casting. Marks lost at controls—late at Norwalk, 4; towed to New Haven, 181.

B. 73., Foster 4 h.p. S. surrey, 1640 lbs., 1540 marks—Penalized stops, 23; 6 hrs.; seven times for air pressure, lighting fire twice, repaired air pump three times, repairing air tank twice, fixed lubricator, put on chain, fixed broken nipple, getting up steam, cleaning check valve, low steam pressure, overtime taking water twice, let out water from air tank. Non-penalized stops, 27; 3 hrs., 30 min., 30 sec.; twenty-one stops for water, two for gasolene, Nature twice, blocked traffic, tire trouble. Control repairs, 2; Oct. 12, repaired air tank; Oct. 12, cleaned check valves and cleaned machinery. Marks lost at controls—missed control, Worcester to Boston, 191.

B. 75., Rambler 4½ h.p. G. runabout, 1180 lbs., 2070 marks—Penalized stops, 2; 19 min.; battery connection, inlet valve pin lost and short circuit. Non-penalized stops, 4; 29 min.; Nature, blocked traffic, Nature, funeral procession. Marks lost at controls—late, 1; late, 2.

C. 76., Fournier-Searchmont 8 h.p. G. tonneau, 2065 lbs., 2092 marks—Penalized stops, none. Non-penalized stops, 8; 7 min., 44 sec.; R. R. crossing, interference by another contestant, R. R. crossing, Nature three times, frightened horse, blocked traffic. Control repairs, 1; Oct. 12, repaired muffler.

B. 77., Rambler 4 h.p. G. runabout, 1135 lbs., 2084 marks—Penalized stops, 1; 7 min., 20 sec.; lost split pin. Non-penalized stops, 4; 18 min., 30 sec.; R. R. crossing, recovering goggles, R. R. crossing, puncture. Control repairs, 4; Oct. 9, tightened clutch; Oct. 10, tightened nuts; Oct. 15, new spark plug; Oct. 15, wired rear axle.

A. 79., Oldsmobile 4 h.p. G. runabout, 920 lbs., 1920 marks—Penalized stops, 8; 41 min., 10 sec.; shutting pet cock, leak in water tank, engine quit on hill, bad mixture, new spark plug, vaporizer trouble, vaporizer trouble, gasolene supply all out. Non-penalized stops, 2; 1 min., 20 sec.; blocked traffic, recovering box. Control repairs, 2; Oct. 12, adjusting and cleaning; Oct. 13, adjusting and oiling. Marks lost at controls—overtime in cleaning (excess of two hours), 120.

B. 80., Foster 4 h.p. S. roadster, 1420 lbs., 2880 marks—Penalized stops, 4; 8 min.; lighting pilot, lost pin in brake rod, lighting pilot, new lock-nut screw on engine bearing. Non-penalized stops, 16; 2 hrs., 59 min.; eleven stops for water, two for Nature, two for railroad crossings, one for resetting tire. Control repairs, Oct. 13, fixed brake rod shackle and cylinder oiler; Oct. 14, adjusted cylinder oiler; Oct. 14, adjusted automatic regulator; Oct. 15, adjusted brake. Marks lost at controls—early at Hartford, 5; late at Boston, 8.

Sample Steel Rail Road Finished.

Wednesday afternoon General Roy Stone and Major F. B. Jones arranged a little informal test of the new section of steel road that has just been completed along one block of Murray street, New York., between Broadway and Church street. A two-horse ashcart with a sheet iron hopper body which weighed 3,700 pounds was procured. The horses were unhitched and a rope fastened to the pole. About the middle of the rope a bight was taken about either end of an ice-balance, that would register 500 pounds, so that the amount of the pull would be registered on the balance. The rope was manned by laborers, and Major Jones read the balance.

The cart was a little too wide for the rails, and it was difficult to keep its wheels from binding on the ridged edges of the steel. Once when the wheels bound the cart was started by a pull of 320 pounds. Again 200 pounds started it. It was kept moving over the rails by a pull that varied from 80 to 120 pounds, or an average of 100. Then it was tried pulling the cart astride the rails, so that the wheels ran over the same grade on the granite blocks. The balance would not register what pull was required to start it. It was more than 500 pounds. To keep it moving the pull required varied from 120 to 200 pounds, and the average of 160 pounds is a fair one to put down, for most of the time the indicator hovered about those figures.

As the test demonstrated a lessening of 40 per cent. in the traction by the steel rails, General Stone expressed himself as much gratified. The city officials and Automobile Club officers will be invited to a more formal demonstration to be held later.

Reunion Dinner and Testimonial.

Having raised a fund of $450, the committee appointed by participants in the Reliability Run has purchased a valuable stop watch, and will present it to Secretary S. M. Butler, of the Automobile Club of America, at a reunion dinner to be held at the New York Athletic Club on Dec. 22 at 8 o'clock. W. E. Scarritt will officiate as toastmaster. The tickets for the dinner are $2.50 each, and can be procured by any one interested from C. H. Gillette, 22 Burling Slip, New York.

Recent Incorporations.

Bridgeport, Conn.—Bridgeport Motor Co., with $100,000 capital, to make launch and automobile motors.

Chicago, Ill.—The Standard Motor Vehicle Co., with $1,000,000 capital, to build motors, commercial and pleasure vehicles, heavy trucks and streetcars. The officers are R. W. Lyle, president; Parker H. Sercombe, vice-president, and C. M. Paine, of Milwaukee, secretary and treasurer.

Active Season Planned at Tarrytown.

For the purpose of taking an inventory and making necessary repairs, the plant of the Mobile Co. of America has been closed for a short time. Operations will be resumed on a larger scale as soon as these are completed.

Removed to 43rd Street.

The local agency for the Stevens-Duryea cars, made by the J. Stevens Arms and Tool Co., has been removed from 523 Fifth avenue to 54-56 West Forty-third street.

Every inch of space has been taken at the Madison Square Garden show, which opens on January 17. The total number of exhibitors is 122.

BACTERIALOGICAL LORE

Ten Families of Microbes That Infest Pneumatic Tires Discovered.

An unexpected enemy of the pneumatic tire has been discovered—no less than ten different kinds of microbes. To M. Michelin belongs the honor of bringing them to light and telling of their nefarious work.

It is harmful, he says, to let wet penetrate a tire. The cotton of which the fabric is made up is quickly attacked by destroying agents when exposed to the wet. Experiments made with various types of cotton placed in damp cellars showed that various growths quickly battened on it, and took away all its strength. Something analogous happens with a tire.

An unattended gash in the outer cover lets the wet penertate to the layer of cotton, and here it works its baneful effects. When in active use there is a chance—though a small one—of the damp being forced out, or of dust or some other drying agent getting in, or of the sun, dry air, or the heat of the tire destroying the moisture. But when a car is laid aside in a damp place for weeks or months the tiny destructors, which may be called tire microbes, can work full time. They may localize in one spot, or find several colonizing grounds as their nature directs for there are about ten different families in the business.

But their work is always thorough. The motorist one fine day takes out his car. There are apparently only a few tiny gashes in the tires, and with no indication of danger about them. But he has not run many miles when one or more of the covers burst. He is surprised at such a big burst taking place, but an examination reveals that the cover is practically ruined.

COMPOUNDED THE ENGINE

And Then it was Quite Ready to Climb the Side of a House.

They had come upon the hill unexpectedly, and there was no reserve of steam to draw upon. Consequently, when the grade became steeper and steeper, until it bore a faint resemblance to the side of a house, the gauge showed a steady and alarming shrinkage. From something over 200 pounds it dropped to about 30. Then the car came so near stopping that the driver threw the lever back, shutting off steam entirely, and applied the brakes as the car came to a stop.

He then dismounted and disappeared under the vehicle. Emerging in about a minute, he remarked:

"Well, I guess we will go up now, all right. She is compound now, and it would take more than a 50 per cent grade to stop us."

And his boast was made good, for upon the journey being resumed the remainder of the hill, which turned out to be steeper than the part already traversed, was scaled, slowly, to be sure, but none the less certainly. Upon reaching the top the engine was changed back to simple again, and no further trouble was experienced.

AN AUTOCAR ON THE BRINK OF A BABBLING BROOK NEAR ARDMORE, PA.

That Important Member, the Clutch.

A most important thing is to keep the clutch free from mud, as this, if it once gets into the leather, is very difficult to get rid of and is a very dirty job. Indeed, when this happens one is very apt to feel inclined to tighten up the clutch until it gets grip. Needless to say, this is a dangerous proceeding. The best thing to do is to wash the leather with gasolene by means of an ordinary paint brush, which, by the way, is a useful thing to carry about in the car, as it comes in handily for many purposes. Fuller's earth, powdered ordinary chalk (not the French variety) or lime should be used to dry up the clutch leather.

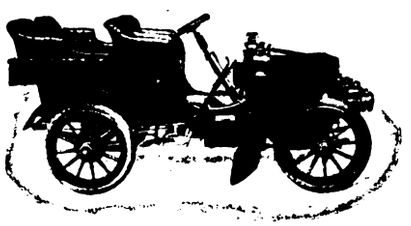
In Sympathy With Movement but Vetoes Bill.

Although returning with his veto the ordinance passed by the Chicago City Council's requiring automobiles to display numbers eight inches high on their backs, Mayor Harrison declared himself to be in favor of the measure.

He said that several months ago representatives of the park boards had conferred with the city on a uniform system of regulations for automobiles, and as the machines used the boulevards as well as the streets, he favored co-operating with the park boards in passing an ordinance applicable to boulevards as well as streets.

The veto was sustained, and the ordinance was sent to the judiciary committee with instructions to send for representatives of the park boards when considering the measure.

Bridgeport Club has Fine Quarters.



Hereafter the Automobile Club of Bridgeport will make its home in the automobile building recently erected in State street by W. S. Brandegee. At a meeting of the club last week a proposition was made to Brandegee to rent the front room on the second floor of the station, and an offer was made for certain privileges for members. These arrangements were agreed to, and the recommendation that a lease be taken for one year, with the privilege of renewal, was adopted unanimously.

Hereafter club members, by the provision of the contract, will have free storage at the station not exceeding forty-eight hours at a time, and members will secure special rates for monthly storage.

Automobile Railways in France.

A new system of railway communication will be inaugurated in France on June 18, cable dispatches say, consisting of the substitution of automobiles for existing locomotives and cars. Each automobile will be the size of the present corridor carriages, and will accommodate forty passengers and their baggage. Speed will be sixty-one miles an hour. The initial trip will be from Paris to Dijon.

In a four-cylindered engine try and keep the four cylinders running evenly. Keep all the valve springs of the same strength, and see that the tremblers on the coils are evenly adjusted.

Style "F," Type 6.

AN IRISH MUFFLER

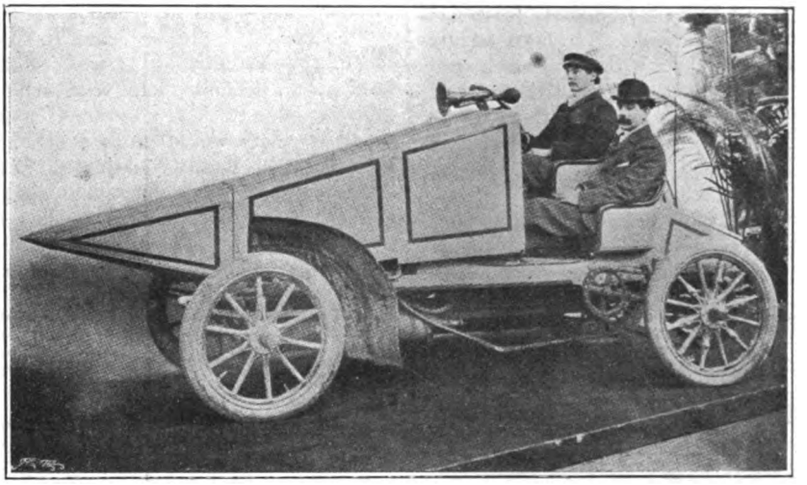
Inventor of Dunlop Tire has a Marvellously Effective Device—Its Construction.

There has been considerable curiosity felt as to the construction of the muffler used by J. B. Dunlop, the famous inventor of the Dunlop pneumatic tire, and of late years an ardent autoist. Remarkable results in the way of silencing were known to result from the use of the motor, but details concerning it were not obtainable.

It is now stated that, after experimenting with two mufflers, a third has been produced, with equally good results. The principle is the converse to that of the ordinary organ pipe. The one develops the waves of sound, the other suppresses them.

The muffler consists of a comparatively small cylinder, with a tube running through the middle of it, giving an absolutely clear passageway. In fact, there is no obstruction whatever to the escape of the exhaust gases, and there can be no back pressure. This tube has three openings in its side into the cylindrical chamber, each measuring about ¾ inch broad. The effect of these openings is remarkable. They absolutely suppress all sound, without in any way interfering with the escape of the exhaust gases. This was tested in a simple and effective way by shouting down the central tube and then trying the same experiment with an ordinary tube.

One very strange and interesting result effected by this silencer is the cooling of the exhaust, which Mr. Dunlop ascribes to the absence of friction, which is usual in the case of most silencers. He states that when the hand is held against the orifice the issuing gases are very little warmer than the ordinary air.



That there is no appreciable back pressure Mr. Dunlop states the following test proves: If the hand is put against the issuing exhaust it will be found that it is ejected in a series of sharp and distinct puffs, whereas in a silencer where there is considerable back pressure the exhaust gases are squeezed out, so to speak, and come out in a more or less regular stream.

What is Shown at Paris.

The present Paris show is the fifth of its kind, the first having been held in 1898. It will continue for fifteen days.

The show embraces sixteen classes of exhibits, which are kept strictly separate, so as to permit visitors readily to give special attention to those branches in which they are most directly interested. The admission is set at one franc, except on Wednesday, when it is three francs. The sum of five francs is charged on special days. Following are the classes of exhibits:

1. Complete automobiles of all descriptions, including motorcycles, exhibited by manufacturers only. An exception is allowed in the case of exclusive representatives of some foreign (non-French) machine, who are admitted in this class if they agree to exhibit only the one type which they represent.
2. Cycles of all kinds.
3. Construction material and tools used in manufacture of automobiles, bicycles, etc.
4. Tires for motor vehicles and cycles.
5. Chassis (running gear and frames).
6. Component parts and accessories.
7. Motors for automobiles and boats, storage batteries.
8. Automobile trade. This class is reserved for dealers exhibiting vehicles handled by them.
9. Navigation.
10. Aeronautics.
11. Applications of denaturized alcohol.
12. Divers sports and touring.

AN ENGLISH IDEA IN RACING CARS.

13. Carriage body work for automobiles.
14. Dress and equipments for automobilists, cyclists and tourists.
15. Invitations and sundry matters pertaining to automobiles, cycles and sports.
16. Bibliography, photography, maps, periodicals.

When to Use the Sprag.

If there is any doubt about the holding power of the brakes, and a sprag is depended upon to avert accident in case of their failure, care should be taken to use it properly. In ascending a hill the sprag should be dropped at the beginning; then it becomes automatic, and if the chain should break the sprag digs into the ground the instant the car stops. Before it has time to acquire speed backward the sprag will be "biting" hard enough to hold the car. On the other hand, if the sprag is not dropped until the stoppage has taken place and the backward movement commenced, it will take a stouter bar of steel than is usually made into a sprag to bring the car up standing.

SARTORIAL ADORNMENT

How Conventional Costumes are Replacing the Outre' Ones of the Past.

The abandonment of conventional automobile toggery is becoming more and more common. A few days ago, when the thermometer was at the freezing point, a well-known New Yorker was seen out in his own tonneau car in company with another man and two young women. The men wore derbies and ordinary walking attire and the women were similarly clad. The most striking feature of the party was the big hats which the women wore, trimmed with white plumes and other delicate material, which is easily torn or soiled.

It seems to be getting to be something of a fad for automobilists to show familiarity with, or contempt for, automobiling by hopping into a car and going for a run in any sort of dress. But is this really smart, in good taste, or wise? The same persons would not tolerate the thought of going out for a saddle ride unless clad in the full equestrian regulation costume, nor would they go for a drive behind a horse unless properly dressed for it.

Mask, goggles, leather cap and coat are not necessary always, but derbies and feather-trimmed hats and walking suits are ridiculous in an automobile. Some enthusiastic motorist with a talent for dress can make a hit and confer a benefit by devising some sensible, distinguishing and readily donned and doffed dress for automobilists.

Prowlers Make Their Appearance.

"Prowlers," in the shape of bicycle policemen, dressed in plain clothes and otherwise stripped of every vestige of their calling, are the latest. They are to be turned loose on Pelham avenue, leading out of this city to the northeast, and bidden to make miserable the lives of automobilists traversing that road.

Digitized by Google

MECHANICS ARE MADE

Users of Automobiles Acquire Technical Knowledge Almost Without Knowing it.

While a Motor World man was sitting in the office of one of the largest selling and storage establishments in New York City one of the hands came in with a part from a machine of foreign make to ask what he should charge Mr. So-and-so for fitting a new shifting sleeve in it. A considerable discussion ensued, in which the difficulties of the job were explained, and it came out that the chauffeur and utility man was to make the needed part himself and fit it. After the price had been fixed and the man had left the office the manager turned to his visitor and said:

"Did you ever pause to think seriously of how much the automobile is doing in the way of spreading mechanical learning? Now, that man, when he came here, hardly knew enough to run an electric coach, but you heard how glib he was about that job. He has a very indifferent education, yet he knows more about the practical end of that job than I do. He had me going for a while, and I'm a mechanical engineer.

"We have half a dozen men like that with us—self-educated mechanics, and, so far as automobiles go, you might almost call them experts. After learning for themselves they teach others, and the mechanical information of the working man in this country has a much higher average than it had five years ago. Once they get a smattering of it, they go right ahead and do not stop at automobiles. They might not be able to pass a written technical examination, but there are a lot of men now in this business who in a plant could prove themselves to be very practical mechanical engineers.

"Think, too, of what has been going on among business men and men of wealth and leisure. Some of them, although college bred, never knew any more about mechanics than enough to use a corkscrew, but since they became automobile owners, look at them, with black hands and torn fingernails from tinkering their own machines. And don't you think that they are bunglers, either. There are a couple of men worth their millions who store their machines with us, who are as handy at making a repair on the road and improvising a makeshift as the foreman of a shop.

"Of course, the bicycle began it. You can recall how astonishing it was to discover how many persons there were who didn't know enough to use a wrench; how hundreds of riders would go to a bicycle store to have their bearings adjusted, and even to have their handlebars and seat posts changed. The early riders learned all the tricks, and they became dealers and repair men. Next they took to building their own bicycles, and a few to sell, until it got so that some of the best machines you could buy were made in small shops. We have some of that sort of men with us now; in fact, the automobile business has been very largely recruited from the ranks of such, as you know.

"I suppose, too, that many of the genteel and wealthy owners who are practical operators of machines began their education by tinkering with their bicycles. They, like the chauffeurs and the men who are repairing machines in the garages, have had only a practical course in the school of experience and experiment. That is the best kind, too, even if it is not as thorough as the curriculum of a college. The whole course of education begins with the proper handling of a screwdriver and a wrench, but the automobile has carried it along until there are thousands who are now able to grasp a mechanical proposition and solve the workings of a machine that would have completely 'stumped' them a few years ago. The automobile is making the whole nation to a certain extent mechanical. This is more true here than abroad, because of the American inquisitiveness and pertinacity in trying to learn about new things which it does not understand. Not but what there is still a lot of dense ignorance regarding automobile engines and driving gears, but the learning that has been spread among the unmechanical and crudely educated as well as the uninformed men of culture is amazing."

Dealers Can Control the Business

in their towns when they handle

The Spaulding

It puts money in your pocket and leaves more in those of your customers' than any automobile you can sell them. You are both happy.

Happiness is catching; that's why SPAULDING owners have lots of friends who increase the demand.

Foreign View of Automobile Legislation.

Here is one reflection of what we are "as others see us," taken from The Car, of London:

"Legislation dealing with the automobile in America is entirely chaotic, as several States, including New York, Connecticut and Massachusetts, have passed different laws regulating automobile traffic. All are curious examples of prejudice, ignorance and impracticability. In some towns motor drivers appear to be compelled to adopt about the speed at which a smart young nurse would wheel a child's perambulator along the footway of one of our London suburbs. It is, of course, not very surprising that ignorant aldermen and councillors, excited by newspaper diatribes, and absolute 'greenhorns' in regard to automobiles and their mechanism, should frame such absurd enactments, while their notions as to locomotion limits are often quite grotesque. The idea of restricting the speed of motors to those which a pedestrian walking rapidly, or a donkey when trotting, could easily exceed, is manifestly absurd. Yet these are the sort of ridiculous limits that have been imposed in certain of the American towns where aldermen and corporations have been influenced by the 'fee-faw-fum' stories in the daily press."

Wheels That Adhere to the Road.

A factory has been rented in Nashua, N. H., by H. T. Stillman, in which to manufacture a new type of automobile wheels, which differ in many respects from those now in use. The wheels are so made that they adhere to tracks in slushy weather and also reduce materially the cost of building tracks. They are adapted for use on automobile, storage battery carriages or streetcars. The wheels are now in use on one of the lines in Fifth avenue, in New York.

The Week's Patents.

715,302. Steering-gear for motor-carriages. Henry A. Schryver and Fred C. March, Warren, Ohio. Filed March 8, 1902. Serial No. 97,292. (No model.)

Claim.—1. In a steering mechanism, a steering-shaft, steering-wheels, and intermediate mechanism connected to said shaft and wheels, the rotation of said shafe from its normal position to a definite point producing retarded angular movement of the steering-wheels.

715,305. Pneumatic tire. Edward H. Sedcon, Brooklands, England. Filed April 15, 1901. Serial No. 59,929. (No model.)

Claim.—1. In a pneumatic tire the combination of a tubular cover divided on its outer periphery and formed with lateral dovetail projections at the edges, a detachable tread part adapted to fit over said dovetail edges and having metal dovetail clips embedded in the india rubber of said tread part and faced with canvas and arranged transversely at a short distance apart from each other.

715,361. Elastic tire for vehicles. Henry H. Durr, New York, N. Y. Filed July 25, 1902. Serial No. 116,945. (No model.)

Claim.—1. The combination of a hollow metallic rim, a tire having elastic sections and a flexible and non-frangible base composed of alternating layers of fibrous material and rubber, the whole being molded and vulcanized into an integral structure, transverse clamping-bars located on the web of the tire between its sections and which extend substantially from side to side of the tire and a bolt or bolts for securing the clamping-bars, for the purpose set forth.

715,411. Running-gear for automobiles. Charles E. Neal, New York, N. Y. Filed December 24, 1901. Serial No. 87,117. (No model.)

Claim.—In a running-gear mechanism for automobiles, the combination consisting of a motor K; motor-shaft D'; clutch member L; bearing E2; supported beneath the mobile-frame; shaft D; bearing E E; universal joints F F; clutch member L'; constructed to move back and forth on shaft D, through sleeve M, and to revolve with said shaft D; c ilspring H, on shaft D, operating against bearing E, and sleeve M, to throw the clutch member L, into operative connection with member L on shaft D; gear C; on shaft D, and gear C, on axle-carrying wheels B; mechanism substantially as specified, for operating the friction-clutch, consisting of lever R, mounted upon shaft Q, running crosswise beneath the automobile-frame, and supported in bearings Q; forked lever P, located on shaft Q, at its outer end; sleeve M; collar M; and pins O; mechanism for operating brakes, consisting of lever S, on shaft Q, arm S, and lever S2, on pipe T; pipe T operating in bearings T T crosswise of the automobile-frame A, and supported beneath it, and arranged t operate brake-bands W, on wheels B, by means of a connecting cord; all constructed, arranged and combined to operate substantially as and for the purposes hereinbefore specified.

715,412. Storage battery. Leonard Paget, New York, N. Y., assignor, by mesne assignments, to Charles Coster, New York, N. Y. Filed September 8, 1899. Serial No. 729,836. (Specimens.)

Claim.—1. A storage battery having an absorbent material for the electrolyte consisting of silicated tufa.

2. A storage battery in which sulphric acid forms the electrolyte of the battery and is contained in a body of silicated tufa.

715,430. Detachable pneumatic tire. Frank A. Seiberling, Akron, Ohio. Filed March 12, 1902. Serial No. 97,855. (No model.)

Claim.—1. The herein-described tire of the class specified which consists of an endless inner tube, an outer envelope, severed longitudinally on one side, in combination with a metallic concave rim, a U-shaped outwardly-open metallic trough with outwardly and downwardly turned sides, with its base secured lengthwise of said rim, and binding-rings, wedge-shaped in section resting between said rim and envelope, and means for contracting said rings, substantially as shown and described.

715,559. Motor engine. David A. Decrow, Lockport, N. Y., assignor of one-half to the H lly Manufacturing Company, Lockport, N. Y., a corporation of New York. Filed October 19, 1900. Serial No. 33,540. (No model.)

Claim.—1. In a vertical motor-engine, the combination of an elongated upright frame structure, a crank-shaft supported at or near the base thereof and provided with a crank, cross-head guides disposed on said frame adjacent to said crank-shaft, a motor-cylinder disposed on said frame high above said crank-shaft, a low cross-head adapted to slide on said guides near the base, a relatively short connecting-rod between said low cr ss-head and crank, and an elongated piston-rod connecting the piston of the motor-cylider with the cross-head.

715,562. Drive-chain. James M. Dodge, Philadelphia, Pa., assignor to the Link Belt Engineering Co., Philadelphia, Pa., a corporation of Pennsylvania. Filed October 10, 1901. Serial No. 78,205. (No model.)

Claim.—1. In a driving-gear, the combination of a sprocket-wheel having a series of platforms on its periphery and recessed between the platforms to form driving-teeth, a chain made up of a series of links pivoted together, said pivots resting upon the platf rms of the wheel, and having intermediate driving members resting in the recesses between the platforms and driven by one series of teeth formed by the recesses, substantially as described.

715,593. Wheel. Fred Lyon, Ithaca, N. Y., assignor of one-half to William J. Romer, Ithaca, N. Y. Filed May 28, 1902. Serial No. 109,282. (No model.)

Claim.—1. In combination with a rim and tire, oppositely-arranged rocking clamping-jaws fulcrumed in the rim and engaging the inner and side faces of the tire and means for engaging the jaws and rim simultaneously rocking the jaws to engage the tire.

715,595. Driving mechanism for vehicles. Lars G. Nilson, New York, N. Y., assignor to Siegfried M. Fischer and Harry S. Fischer, New York, N. Y., and Huldah Anderson, Des Moines, Iowa. Filed May 14, 1902. Serial No. 107,242. (No model.)

Claim.—In a driving mechanism for vehicles, an axle, elongated hubs mounted to rotate on the axle, bearings for said hubs, springs supported by the bearings, gear-wheels attached to the hubs at the inner sides of the springs, independent motors having swinging connections with the axle at the inner ends of the hubs, pinions on the motor-shafts and engaging with said gear-wheels, casings inclosing the gear-wheels and pinions, and a frame connecting the two motor-casings and in which the inner ends of the motor-shafts have bearings.

715,670. Automobile-crane. Moses W. Kouns, Washington Court-House, Ohio. Filed September 13, 1902. Serial No. 123,239. (No model.)

Claim.—1. A motor-vehicle for ordinary roads, comprising a load-platform, driving and steering wheels on which said platform is supported, a crane mounted on said platform, a motor, and means for connecting said motor at will either with the driving-wheels or with the hoisting mechanism of the crane, substantially as described.

715,725. Multiple-cylinder engine. Lewis C. Worron and Abraham Vanderbeek, Hartford, Conn., assignors to said Vanderbeek. Filed October 12, 1898. Renewed July 30, 1902. Serial No. 117,693. (No model.)

Claim.—1. A circular group of cylinders and pistons within the same and connecting-rods, in combination with the main shaft and crank connection thereon, a crank-pin and crank-pin-head connection between the crank of the main shaft and the connecting-rods of the pistons, a trunnion-frame having trunnions at its ends and mortised for the passage of the crank-pin, a pin passing through the crank-pin at right angles to said trunnions and having projecting ends passing into bearings or bosses on the trunnion-frame, substantially as specified.

715,094. Automatic Pump for Pneumatic Tires. Charles S. Langton, Parkersburg, Ill. Filed December 26, 1901. Serial No. 87,206. (No model.)

Claim.—1. The combination with a wheel having a pneumatic tire mounted thereon, of a pump for inflating the tire, a U-shaped slide-link having the pump-piston connected therewith, levers adapted to be operated by the tire, and means connecting the levers and slide-link whereby the pump-piston may be reciprocated.

The Value of Kerosene Taps.

If your car is unprovided with means by which kerosene can be injected into the cylinder, and the latter is not fitted with a compression tap, it is a good idea to have a kerosene pump lubricator fitted to the dashboard with a delivery pipe, or, in the case of multiple cylinder forked delivery pipes to the lubricating pipes, as close to the entrance of the latter to the cylinder as possible. The cylinder oil pipes must be provided with cocks just above the junction of the kerosene pipes, so that by turning off these before you do your kerosene pumping on coming in from your run, the latter oil is not forced back, as it may be, into the cylinder oil tank. Above all, do not forget to turn these added lubricating oil cocks on directly after you have flushed with kerosone. Forgetfulness in this particular may mean seizing, with all its horrors.

If a Brooklyn paper is to be believed, the cost of falling into the police traps in Suffolk County, Long Island, is now but $25, as against $50, the former penalty. District Attorney Livingston Smith has even issued a circular stating that the rate has been cut.

The WHITE Steam Carriage

AN AUTOMOBILE THOROUGHBRED.

In the 500-mile Reliability Contest from New York to Boston and return, arranged by the Automobile Club of America, three **WHITE STEAM STANHOPES** covered the distance without stop or trouble of any kind—a perfect performance.

The White Steam Generator is absolutely non-explosive, gives pressure in five minutes from cold water, and once in motion is self-regulating. In touring, the **WHITE** will make 100 miles without adding a drop of water or fuel to the original supply.

Write for full particulars, including Prof. Thurston's report on our steam generator, and the official reports of important endurance contests.

THE HAYNES-APPERSON

is the only automobile that has been consistently developed through 10 years of successful experience on American roads.

The same development that has given foreign cars their reputation has given the Haynes-Apperson its proved reliability, but because of the more severe conditions under which it has been produced there is no car of equal horse power that will last as long, handle as easily and ride as smoothly on American highways as this American product.

Runabout, 7 horse power, 2 passengers, $1200.
Phaeton, 12 " " 2 " 1500.
Surrey, 12 " " 4 " 1800.

DISPLEASED WITH RESULT

Reliability Runs are Empty, Says This Critic, who Suggests an "All Round Championship."

"The reliability book? Oh, yes, I have one. But, tell me, now, what good did it all do to us, the manufacturers?" It was the chief representative of a very prominent maker who spoke. He continued: "I can't see where it has been of any direct benefit to any one. There was not enough about it that was tangible for the general public, and that is what we are after. We are not catering to the enthusiasts. We have them. The general public does not know any more which machine stood the racket best than it did before the reliability run. All it knows is that certain machines got in first, but that a lot of different ones got prizes and all got certificates. It has a confused idea that we were racing for points on some kind of a complicated plan that it does not understand.

"I do not mean to be narrow when I ask what good it has done, for I know very well that the run was a great boon for the industry as a whole, and that the public estimation of the reliability of American machines was elevated by it, but it has not really helped any one to sell machines. I suppose at the show there will be sixty-five first class certificates displayed, and what good will they do? The public will be more confused than ever. I did not take the run seriously, and I am glad I didn't. If I had I think I would feel very sore now.

"What we want is some kind of a contest that will be decisive of something, will settle the question of speed or endurance or controllability or whatever it may be; something run in a way that will enable the public to put its finger on some certain machine and say: 'This is the best.'

"The idea of the English club to have a run of 1,000 miles with no stops that are not penalized is a better one than ours. Of course, there is luck in the matter of punctures and railroad crossings, but all start with the same chances to take. The matter of allowing for hats blowing off and dropping things is a direct bid for faking. It may be all right to allow a certain few minutes for cleaning and oiling up, but what a simple matter it is for a man to slip in a bolt or two or fix some part while simply oiling up? Yes, it's better to take off a mark for every stop and every minute of attention given to the machine, and let it be seen who can lose the fewest marks. Then there will be more to the test; but it won't be wholly satisfactory even then. Why couldn't we have a competition on the plan followed in athletics? We could, I think, have a series of contests extending through from spring to fall. A speed test, a hill climb, a fuel test, an endurance test, a real one, and a few other sorts of tests. Points should be allotted for each different contest, and the best one at each game could be picked by the number of points won in the individual contest, while at the end of the season the all around champion could be selected by the total number of points won in all the contests."

Alters Name; Adds Gasolene.

An important step is about to be taken by the National Vehicle Co. of Indianapolis, Ind. They are preparing to place on the market a line of gasolene cars, which will be sold under the name of the National. The company's National electric vehicles will, of course, be manufactured and sold as in the past.

A change of title is also announced. Beginning with January 1 the National Motor Vehicle Co. will be the new name of the present company. The change, which is, of course, one of name only, is taken to avoid the confusion arising from the existence of several concerns bearing the word "National" in their official titles.

Is Fisk's Own Tire.

Because of there having been recently granted a license to manufacture tires under the G. & J. patents, the impression has gained considerable currency that the new Fisk detachable tire is made under that grant. This, however, is not the case. The Fisk tire differs entirely from the G. & J. principle, air pressure not being necessary to hold it in the rim, and is made under a patent covering eight broad claims and owned and controlled absolutely by the Fisk Rubber Company.

RAINIER WILL BUILD

First Structure Designed Specially for Automobiles to be Reared on Upper Broadway.

Ground has been broken for the first building to be planned and erected in New York City exclusively for automobiles. It is a matter of no little interest that the concern to project and execute this departure is one that has made very little noise and yet has been "sawing wood" in great style on a sawbuck which other makers have passed by—the commercial draught vehicle. It is The Rainier Company, selling agents for the Vehicle Equipment Company, that is to have this first specially constructed building.

It will be at the corner of Broadway and Fiftieth street, and will be four stories high above the basement, with an elevator for vehicles, and every floor built to sustain the weight of as many as it will hold. The Rainier Company has taken the agency of the Berg Automobile Company, and in the new place will have showrooms and executive offices for the full line of Bergs and the output of the Vehicle Equipment Company.

An extensive garage also will be conducted, but pleasure vehicles only will be stored, all trucks and delivery wagons must be stored at the station the company now has on Twenty-seventh street, near Seventh avenue. There an extra building, the same size as the present one, 100x100, has just been leased, in order to extend the facilities to just double what they are there now.

Speaking of the new establishment on Broadway, Mr. Rainier said to a Motor World man:

"We intend to have the finest place of the sort in this country. We will have the best repair department, the best charging plant, and every up-to-date appliance that can be devised. There will be a special waiting room for women and attendants enough to give prompt service to every one. We will cater to the best classes, do the best work, and, if it is a matter of interest to you, we will charge the best prices."

The new building will have a frontage of 100 feet on Broadway and run back 500 feet on Fiftieth street.

A "MERCEDES SHOW"

The Advance Verdict of the Paris Function and the Reasons for It—Trend of Trade Outlined.

French Bureau Motor World.
2 Rue d'Abbeville.

Paris, Dec. 9.—That the fifth annual Automobile Show, which opens to-morrow in the presence of the President of the Republic, is going to be one of the biggest things yet held no one would venture to express a doubt. Everything points to its being a splendid manifestation of motor vehicle progress, and an object lesson in the enormous development which has taken place in automobile manufacture, not only in France, but also in other countries in Europe and America. The demands for space have far exceeded those on any previous occasion, and when drawing for sites even some of the leading firms have been obliged to accept with as good grace as possible the indifferent positions which chance has allotted to them. A great number of new makers have entered the industry during the last year. New factories are springing up in all directions, and now that the ranks of manufacturers are swelling steadily the old firms find it necessary to fight to maintain their lead. It is not that the supply is outstripping the demand—far from it—but the public will only have the best, and thus manufacturers are striving not so much to turn out more than others, but to produce something better.

It is this which gives so much interest to the show. And the interest is further increased by the competition of foreign makers, who, after being so long under the tutelage of France, think that they are now able to look after themselves, and are showing their independence by boldly sending their cars for comparison with the best that France can turn out. For the first time the show will be thoroughly international, in the sense that it will include vehicles from all countries—America, England, Belgium, Germany, Austria and Italy—but whether these exhibits will be representative has yet to be seen. The only foreign makers of importance abstaining are the Daimler Motor Works, of Cannstatt, and this seems to be due solely to the fact that the 1903 cars are not yet ready and will not make their first appearance before the meeting at Nice.

We said just now that makers are striving less after quantity than quality. But this needs some reservation. The cars are undergoing such changes from year to year, and even from month to month, and orders are so numerous, that manufacturers find it necessary to execute them as rapidly as possible before they lose the first bloom of fashion. In these days buyers will not wait six months, a year and even eighteen months for cars, as they did in the earlier days of the industry. There are now so many firms in the trade that if they cannot get what they want from one they will go to another. The progressive maker has therefore to lay himself out to supply all that is wanted and get out one series of cars before he is ready to start upon the construction of new models. Factories are thus being extended in all directions, and during the last six months several have doubled their productive capacity. These are fine times for the machine tool makers, who have shipped enormous quantities of machines to this country, and yet the demand can be said to have only just begun. There are probably half a dozen makers on this side who during 1903 will be turning out one car a day, and when it is remembered what a vast amount of work is

BIRDSEYE VIEW OF THE PARIS SHOW.

Digitized by Google

put into a single vehicle—each taking six months to construct—some idea will be obtained of the importance of these plants.

Competition is spurring makers on to new improvements, and the drawing offices are kept perpetually at work on new designs. It cannot be said that the improvements mean in all cases a simplification and increased efficiency of the mechanism, because if this were so we should very soon see the development of an ideal type of motor vehicle. The improvements rather converge toward conventional types, which become a fashion, and fashion has taken so firm a hold of the automobile that very few firms can afford to strike out on original lines except in a tentative way. It is true that fashion is usually to be commended for its excellent judgment; and, in fact, it can hardly go wrong because it simply fixes upon the type of car that pleases it best, and makers have perforce to dissect the vehicle and copy the features which have secured for it the favor of the public.

The vehicle which is held up for imitation this year is the Mercedes, and the Paris exhibition is becoming generally known as a Mercedes show. The secret of the success of the German car is its silent running and elasticity of engine power and the way in which the motor can be slowed down to, say, 200 revolutions a minute. This is undoubtedly a great point in the eyes of the public. They have had enough of noisy automobiles which rattle and pulsate when it is necessary to stop the vehicles. So long as they were led to believe that a gasolene car was necessarily noisy they put up with it because they thought that nothing better could be obtained, but when the Mercedes came and showed that a vehicle could be not only efficient, but silent, they insisted upon silence as a valuable attribute to an automobile. The thing could be done and must be done, and thus the French makers in a body began to dissect the Mercedes and adopt its constructional features.

If the Mercedes is silent it is due largely to the mechanically operated inlet valve. Therefore the mechanical inlet valve is being adopted by nearly all the French manufacturers and all the motors have been redesigned to this effect, so that the engines at the Paris show will be entirely different from those seen at previous exhibitions. The following is the description of a typical up to date motor: The cylinders are cast in pairs, and the cranks are set in pairs at 180 degrees. The exhaust and inlet valves are on each side of the motor. They are of the same dimensions and are interchangeable. Each valve is closed by a small independent dog instead of the one big dog which formerly went across the top of the motor and closed down a pair of valve chambers. Half time cam shafts, inclosed in casings, are driven from the engine shaft for operating the valves on each side. The motor is throttled automatically and by hand by a throttle valve either in the induction valve or on the carburetter, the latter being the system most generally employed. Except Panhard et Levassor and Charron, Girardotaet Voigt we are not aware of any firm using steel cylinders, though possibly we may see some exhibited at the show. In big motors steel cylinders can only, of course, be bored and turned out of a solid piece of steel, which is a very costly operation, and their price is necessarily considerably more than that of cast cylinders, but owing to their lightness and freedom from flaws they are likely to become a valuable feature in the expensive cars. Charron, Girardot et Voigt have been experimenting with steel cylinder motors on their racing vehicles during the last year, and they are so well satisfied with the behavior of these engines that they are to be fitted to all the 1903 carriages.

There is naturally a good deal of controversy as to the merits of the mechanical induction valve. Apart from the facility it offers for slowing down the engine, it appears to possess no decided advantage, and, moreover, necessitates an extra cam shaft and valve gear. Some makers, therefore, hope to attain the same end with automatic valves by improvements to the carburetter, and the most interesting development in this direction is the carburetter which has been invented by Commandant Krebs, the technical director of Panhard et Levassor. In this device the gasolene is sucked in through the spray nipple by a piston of which the rod is connected with the engine governor. The travel of the piston varies according to the speed of the motor, and more or less gasolene is drawn in. But where the device becomes interesting is the method adopted for regulating the admission of air so that the mixture will always be the same whatever may be the speed of the engine. There are two air inlets, one admitting a fixed quantity proportionate to the spirit when the motor is running slow, and another consisting of ports which are opened and closed by a second piston actuated by the suction of the piston driven from the governor. The second piston is kept up by a spring to close the air ports, and as the suction increases it is drawn down and the ports are opened more or less according to the increasing quantity of gasolene drawn into the mixing chamber. Thus the mixture is always the same, and the engine will run as slowly as required, at the same time that its efficiency is increased by the fact that the gas is always of the same quality. There is undoubtedly a great deal to be done in the way of designing carburetters on these lines.

Another prominent feature of the Paris show will be the steel underframe stamped out of steel plate U section and tapering toward the ends. The usual armored wood frame is still employed for the lighter vehicles, but on the cars of 20 horsepower and more the steel underframe is becoming general. Its advantages over the wood frame are greater strength and stiffness, and in some cases it is claimed to be lighter, while it is probable that the cost is also less. The greater strength and rigidity, moreover, enables makers to suppress the secondary frame to which the engine is usually bolted. This is at present only done in a few cases, but if those makers who are bolting their motors to the main side members find that the result is satisfactory there is no reason why the system should not become general, for the suppression of the secondary frame undoubtedly means increased lightness. In the way of transmission gears the universal jointed shaft is being almost universally employed on the light carriages, and in change speed gears every one is adopting the direct drive on the top speed. These are the main tendencies of automobile construction, and they will be dealt with more fully in our report of the show.

Harkness to Build a Special Car.

One of those little birds who sometimes carry secrets has been flying ahound chirping a story to the effect that the car which H. S. Harkess expects to have represent the Automobile Club in the contest for the Bennett Cup, will be one especially built under his supervision in a private machine shop. It will follow closely the construction of the Mercedes, sings the bird, but then what he sings has occasionally been found to be untrue.

Wheels Replace Levers on Electrics

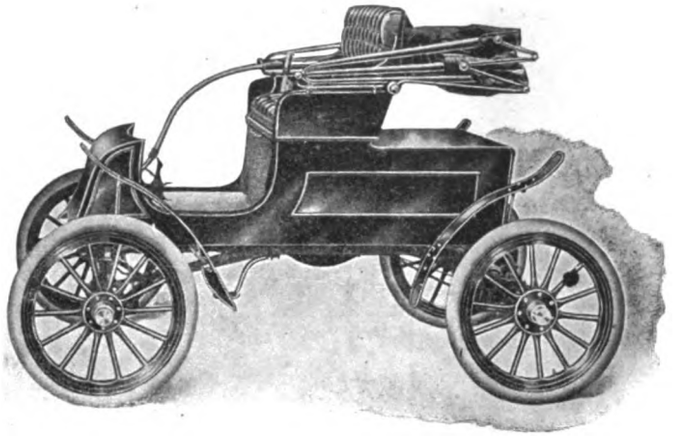
The Vehicle Equipment Company was the first to recognize the inadequacy of the lever on a carriage so heavy as a loaded brougham, and a couple of weeks ago the first of a new output of wheel steering broughams was sent out from its shops. They found ready sale. Now the Electric Vehicle Company and the first of its new wheel steering broughams has been purchased by William C. Whitney.

New York's Newest Firm.

The latest concern to launch its craft on the metropolitan sea with motors set for sails, is that of Fickling & Fulton, two novices, but enterprising young business men who have opened at 248 West Fifty-fourth street. They have storage facilities for eight or ten machines, and a repair shop on the second floor is conducted by C. F. Keuerleber.

Peerless Adds 12,000 Feet.

Although the two additions to the plant of the Peerless Motor Car Co., Cleveland, O., are now completed, adding over 12,000 feet of floor space, other and larger additions are planned. These may take the shape of an additional factory or even a removal to larger quarters.



Dates Set for Philadelphia Show.

March 2 to 7, inclusive, at Horticultural Hall, are the dates and venue, respectively, decided upon for the forthcoming Philadelphia automobile show.

Reliability Data and Morals.

Although so aggravatingly belated that it has lost much interest, the data found in the report of the reliability control committee of the A. C. A. still retains its value.

It is very doubtful whether anything more thorough could be compiled than the detailed story of each car told in the report. The tables lack some features that could reasonably have been looked for, and the lumping of the non-penalized stops—such as for water and on account of tire troubles—was a mistake, for it goes far toward vitiating the entire table. The error is shown most plainly in the steam division, where 84 per cent of the stops were for water and gasolene or for tire troubles—matters that should have been given under a separate head. The control repairs are not figured in the table, yet they are really the meat of the report, for they alone are new.

By a computing process we find that no less than 234 repairs were made at the night controls. As thirteen cars have a clean bill of health in this respect, those 234 repairs were made by fifty-five cars, so that the average is 4.2 per cent. The stops range from the maximum of thirteen for one to one each for four cars. A majority of these repairs were of a trivial character. In fact, many of them were really adjustments, not repairs. But the difficulty of separating them is a herculean one and it has not been made. Yet a separation is desirable, and next year it should be attempted at least.

In these repairs, as well as in the stops en route, it would have been much better had the reports been clearer and more explanatory. Frequently they are so ambiguous that they possess little value. Such explanations as "motor stalled" or "spark failed" do not explain. The cause of stalling or failing should be given as well as the fact. The deficiencies of the observers were to blame for many of these lapses, of course.

A careful perusal of the reports, with special reference to the control occurrences, shows conclusively what was pretty well known before—that no "rebuilding" of cars took place overnight.

When it is remembered that in only about half a dozen instances were cars that had arrived at the night controls on time, or near on time, late in starting, this will seem only natural. Two hours only could be spent on repairs, and frequently the dilatoriness of the observer cut this an hour, or nearly that much, short. Consequently nothing very elaborate in the repairing line could be done.

In point of numbers ignition troubles have a long lead; but without a table showing the duration of the stops it is impossible to ro more than guess at their seriousness. Most of them were of a minor character, easily located and quickly put to rights. Nevertheless, on the face of it, they were much more serious than tire troubles, although it is well known that the latter gave vastly more trouble and took more time to repair.

The mass of information contained in the report cannot be digested in one sitting. It will repay careful study.

Candidates for the Cup.

Probably there will be many points of controversy raised before the three machines to represent the Automobile Club of America in the race for the Bennett Cup finally are selected and shipped from these shores. A man who is in no way concerned with any of the candidates who have thus far declared themselves has already raised the point that only machines which are the product of responsible makers with established factories should be chosen by the club.

This point was raised because of the report that certain candidates would offer vehicles which would be the first ones they ever built.

While in one aspect this contention may seem narrow minded, there is some ground in it on which an argument could stand.

This will be the first time that America has formally asserted its pretensions as an automobile producer in competition with Great Britain and Europe. It will be done ceremoniously by challenge from the club recognized abroad as the representative body in this country. The eyes of the world will be wide open to see what are the machines that will be supposed to be the best produced here. It will be taken for granted that they come from the shops of our greatest manufacturers. Such will be the case with regard to the venicles representing England, France and Germany. Should it not be so with the American machines? Should not the competing cars from this country represent the American manufacturer? Should the car of a clever mechanic who is able to build one that may be better for the purpose of the race than any other be sent to represent the club and country when no such style of car exists as a regular product?

On the other hand it may be very aptly said that if such a car was built and sent over, and it won the cup or made a very creditable showing, it would not then be an isolated specimen. There would be a demand for others like it ,and American enterprise would see to it that such a demand was supplied forthwith. To bar such cars would be to put a damper on the spirit of inventiveness. If a man thinks he has the ideas that can bring into being a car to beat all others he should not be robbed of the incentive most apt to make him try to do it, and the winning of the cup would be such an incenetive. If a man could build his first car well enough to show by preliminary trials here its fitness to compete, why should it not have an equal chance with all others? Again, would it be just to discriminate against any one who is a member of the club should he choose to use his private means in having a car built especially for this event along the lines of his own ideas?

Digitized by Google

The question seems to be one worth considering, but it plainly has two sides to it.

Coal Stringency Affords a Moral.

Many widely diverse elements work for the motor vehicle, and, by a sort of cumulative process, make its almost universal adoption only a question of a limited time.

During two of the four seasons convincing object lessons of its superiority over the horse are taught and driven home, not only to those directly interested, but to others to whom the matter is of little direct importance. In summer the torrid temperature unfits the placid and uncomplaining equine for the work imposed upon him. He suffers intolerably and frequently succumbs, and business vehicular traffic is hampered and disarranged, to the great discomfort of perspiring humanity. Again in winter the same experience, aggravated, is gone through with, until at times it almost seems as if the limits of human endurance had been reached.

With this good, old fashioned winter hardly more than well started, and every indication of worse and more of it being in store, we have been brought up sharply and made to face a situation without parallel. A coal famine rages throughout the land, and relief is balked almost entirely by the inadequacy of the facilities for making deliveries of the precious anthracite by teams. Horses are worked until they can scarcely stand,

Trucks enough can be found and men to take charge of them; or if there is a lack other wheeled vehicles can easily be pressed into the service. But where are the horses to draw them to come from? Diligent search fails utterly to reveal them or to hold out the slightest hope of relief.

It may be said that the obvious remedy is to get more horses. Not so. The horse at his best is inferior to the motor, and at his worst—as now—is so hopelessly distanced that it requires a strong stretch of the imagination to convince one that he is in the race at all. His multiplication would accomplish little in such emergencies as the present.

The other horn of the dilemma is a much more inviting one. The motor vehicle does all that horses can do—and more—and does it more expeditiously and regularly, and with corresponding advantages on the scores of space, economy, cleanliness and lessened wear and tear on the road surface.

That the truth of all this is being borne in on vehicle users is no secret. The presence of increasing numbers of self-propelled wagons and trucks leaves no room for denial. Such experiences as we are now going through will hasten the day when the horse will be banished from cities and regarded in another light than that of drawers of wheeled vehicles.

Silence now a Feature.

As long as users were content to put up with the noise of gasolene cars no very determined effort was made to silence them. There were both difficulties and drawbacks in the way, and with the many other problems to be solved it was felt that the matter of undue noise could well wait a little while.

But the time for action has arrived, and real efforts to reduce the noise to a minimum are being made, and with no small degree of success.

The movement, as far as big cars are concerned, began early this year, when the Mercedes Simplex—frequently sub-titled the "silent model"—made its appearance across the water. Its marvellously silent running was much commented on, and, as the event proved, the lesson was laid to heart in many quarters. Silencers that really silence, in place of mufflers that merely muffle, were for the time neglected, and mechanically operated intake valves taken up and worked over.

If by means of improved valves, etc., an approach to noiselessness can really be reached, as seems to be believed by not a few makers, a big step forward will be made.

To strive to remedy the trouble at the exhaust end is to run the risk of encountering a boomerang. No one can avoid the conclusion that the exploded charge must find ready egress if back pressure is not to result. No matter how ingenious the construction of the muffler may be it will almost certainly be regarded with suspicion. Loss of power will not be readily put up with; if there must be a choice of evils ninety-nine out of a hundred users will choose the noise—at least, until there is some pretty convincing evidence brought forth on the other side.

The general public will welcome any diminution in the volume of sound emitted by the exhaust. Users, more discriminating, will first want to know whether it is an unmixed blessing.

Gentlemen:-

We enclose copy for your foreign edition, which you may also consider a compliment as it is the first ad. of this kind we have placed.

It is due you also at this time that we should say we have been well satisfied with results from The Motor World. It certainly reaches those interested in automobiles and their sale.

Yours very truly,

The Baker Motor Vehicle Co.

Commentary

Some kind soul, who probably thought that in this merry Yuletide whirl I had parted with my small supply of common sense along with the few spare pennies I owned, has kindly sent me a prospectus of the Novelty Exhibition, Christmas Fair and Street Carnival which is to occupy the arena so lately the scene of a six day bicycle "race." The prospectus starts off thusly:

"The object of the Novelty Exhibition is to give the public an entertaining show, appropriate to the Christmas season, where the latest inventions, novelties of all kinds, may be seen at their best. Thomas A. Edison intended placing his latest electric battery on exhibition, but was unable to complete it in time."

If there is any "novelty" in that you can use the ticket I'll never buy to see it with.

* * *

While I am on this easy money topic I'd like to say just a few words about the finest example of disposing of nothing for something I know of. To save time and to get at the subject quickly, the example is the present management of the National Association of Automobile Manufacturers. Here is an organization which, were its officers in the slightest degree representative of the automobile trade, would be a model of its kind. True, it is a model of its kind now, but this particular kind is one which no other trade would for a moment permit itself to be misrepresented and misjudged by. "Easy come, easy go!" The automobile trade has waxed so great and so powerful so quickly that the men who have made it so have had no time to worry about what its national organization was or whose its officers were. A very natural thing has happened. Those who could not in the industry itself succeed, whose failures in the automobile world have been monumental and lasting, have been allowed by the successful men to get control of the national organization with the result that the N. A. A. M. has become a sight for gods and men. Go over the list of national executive officers and on it see how many successful and thoroughly representative automobile manufacturers you will find there. When you have discovered the successes, then seek for the failures; it won't require any strain, mental or visual, to find them, they are there plentifully and prominently enough.

In one way or another there is about $10,000 per year being expended for and by this aggregation of personal and official failures. For what? For themselves chiefly. What does the automobile trade get for this $200 per week? The astonishment of every other trade organization at the kind of people who say they represent the automobile industry, is about all I can see. True, one of the leading misrepresentatives whose I-am-itness is chronic and mastodic, is enabled to find some remunerative berths for his old schoolchums and to further the pecuniary interests of a publication in which it is better than rumor that he has more than a brotherly interest in, but that does not benefit the automobile trade; to the contrary, it is positively detrimental to it. Why, then, should such a discreditable and unprofitable condition of affairs continue?

* *

Passing from the personality to locality, the executive board of officers is not by any means representative. Draw a circle fifty miles from Forty-second street, New York, and you will find that within it are located the large and successful plants of a majority of the board. The great West and New England, the two real homes of the successful automobile makers, are only accorded a minority representation. Why? Once again you will have to answer your own questions. I've been trying to discover an excuse for such an injustice for a year or more now and are no nearer finding it out to-day than I was when I first began to wonder at the supiness which has permitted such a condition of affairs to exist. It cannot continue much longer; indeed, to my mind, time has now come when the real automobile trade can no longer permit its national organization to misrepresent it in the persons of officials who, whatever else they may be, certainly are not representative successful men in the trade, therefore are not fair representatives of the trade which is one of the most successful ones of the day. Pride, self-interest, justice, good business and every other potent reason which should influence a man calls for a change and the call must not remain unanswered. The officials of the National Association of Automobile Manufacturers must be representative men of the trade and for the trade; they must be men who by their prominence in the trade will command the respect and the confidence not only of the trade, but of the commercial world; they must be men with no taint of failure or smirch of lust for private gain or personal animus upon them; they must represent all the trade all the time, not themselves always, and the trade seldom, if ever.

* *

How is this to be brought about? Easily. Let those who have made successes in their own branches of the industry take enough interest in the good repute and welfare of their entire trade to see to it that they and it are fittingly represented by a body of officers which is thoroughly national in its scope. Nominate only men who have shown by their ability to manage their own affairs that they are capable of doing the same for the association, elect them, and then loyally support them as they will deserve to be supported, and everything and every one connected with automobiling will be the gainer. Don't sit down and leave this to the other man. Doing this is what has permitted the organization to get into the hands of those who at present control it, and who fritter away its powers and possibilities for the furtherance of personal pockets, pride or prejudice.

* *

In this matter I hold no brief for any one. What I have written is the result of no personal grievance, but I have wearied of seeing the association made an annex of one man's business, and I shall free my mind at any rate by saying just what I think and by what is evident to any other man who cares to see. There is a natural dislike on the part of every one to be the first to voice a protest against such a condition of affairs as at present prevails in the management of the National Association of Automobile Manufacturers. That there exists a widespread dissatisfaction at the way things have gone I know, and for those who dissent and for myself I am entering this protest. What must come and come quickly, too, is a radical change in the affairs of the national organization and in the personel of those in control thereof. First, a broad-minded, successful man, must be chosen as president. Preferably the ideal man for the office should come from near the geographical, population and trade centre of the country, say, from around Cleveland. Then he should be a man who has a thorough knowledge of men and affairs; he must be a man who it will be a credit for the automobile trade to have act as its representative. Above all he must be a man so securely placed in regard to his worldly affairs as to make it no object for him to view with any interested eye the emoluments of his office, which he should look upon in the light of the highest honor his fellow tradesmen could confer upon him.

* * *

Where is there such a man? Surely you don't mean by this that you think there is any dearth of this kind of presidential timber in the automobile trade! There is plenty of just such men as are needed if you will only open your eyes. Take George Weiss, for example. Isn't he a man who is all and more than I have said the next president of the National Association of Automobile Manufacturers must be? Then, why not elect him to the office, and in doing so honor the organization, the office, the man and yourselves? You've got to face the issue. You can't let things go on in the way they have been going. You have got to elect a man like the one I have named, if you would be true to yourself and to the best interests of your national organization, which is in the end but another name for your business. In the inspired words of St. Tammany: "What are you going to do about it?

* * *

I don't know that Mr. Weiss will thank me for thus bringing him into the glare, but I am not looking for thanks, and Mr. Weiss, I feel sure, would prove the man for the place. If he won't have it, then he and the men of his calibre should get together and find a suitable man, and, having found him, remove the office itself from its present location to one far from schoolchum relationship and "inspiration."

THE COMMENTATOR.

ENGLAND'S 1903 TRIALS

Rules to be Made More Stringent and Hill Climbing to be Featured.

Already the ground has been well threshed over and the outlines of the 1903 British trials have been decided upon. A meeting of the Automobile Club of Great Britain was held in London a couple of weeks ago, at which twenty-five representatives of the industry were present, and the recommendations of a special committee of the club were discussed.

Some slight alterations in these were made, and, as amended, they are as follows:

(1) That the automobile club shall hold a trial (generally on the same lines as the 650 miles reliability trial of 1902) in the year 1903.

(2) That the Crystal Palace shall be the centre, and runs should be made to seaside places at which there are numbers of visitors, such as Brighton, Eastbourne, Folkestone, etc.

(3) That the trial shall include as many hill climbing records as possible.

(4) That the trial shall take place early in September.

(5) That the total distance shall be 1,000 miles, comprised of eight runs of about 125 miles a day.

(6) That cars shall be required to be within the gates of the Crystal Palace by 12 noon on a Wednesday, the first run to take place on the Friday, and the trial to terminate on the following Saturday week.

(7) No manufacturer or seller to enter more than one car of a type in a class. No duplicates.

(8) That the public should be given to understand that the trial is a trial of trustworthiness—not appearance.

(9) No washing shall be allowed, but the car shall be driven straight into the storage building, from which the public, the owners, drivers, mechanics and every one except the club's stewards shall be rigorously excluded. In the morning, when the observer has taken charge of a car, the driver and mechanic may be admitted to the storage building and the word will be given to start. Adjustments and repairs may then be made, but one mark will be deducted in respect of every minute during which the car is stopped or during which the driver or mechanic leave their seats for the purpose of adjustment, washing, repairs or replenishment.

(10) As the exclusion of the public from the storage building might interfere with opportunities of doing business, arrangements should, if possible, be made by which one exact duplicate of each car entered and running may be shown in the upper part of the palace.

C. AIRCOOLED BENJAMIN TESTING A FRANKLIN CAR DURING THE RECENT SEMI-BLIZZARD.

President A. R. Shattuck, of the Automobile Club, says that the Committee of Fifty in New York City, which steadily opposed the passing of an ordinance permitting a speed of ten miles an hour in the city, has now agreed to recommend to the Board of Aldermen that a speed of fifteen miles an hour be allowed outside of the Borough of Manhattan.

Beginning with the New Year the capacity of the Winton plant will be increased to four cars per day. More than 250 of the new touring cars have been sold already, representing a turnover of more than $600,000.

The Subject of Ignition.

One of the most interesting problems in connection with motor-cars has always been the question of the most suitable ignition. Incandescent platinum tubes held their sway for years, and some of the best manufacturers of automobiles would not hear of any other system, and ridiculed electricity as a means of igniting the explosive mixture in the cylinders. Notwithstanding all opposition, however, electric ignition made its way steadily and finished by entirely supplanting tubes, which are now a thing of the past.

They have been banished for two reasons, first, on account of bother with the burners and the attendant risk of fire, and, second, on account of the fact that tube ignition cannot be retarded or advanced. The only defect of the electrical ignition is, perhaps, the attention required to the batteries and the recharging or renewing of the same. In order to overcome this trouble dynamos and magnetos have begun to replace batteries. With the first there is the danger of burning out the armature, if too high a speed be reached, and the difficulty of getting a spark at a slow speed for starting purposes. The magneto, on the other hand, gives a current at a low speed, and for all practical purposes cannot be burnt out. Hitherto with the magneto the spark has been produced by means of a sudden rupture of the circuit in the cylinder. This necessitates a mechanism more or less complicated, worked by the cam shaft, and requiring several small springs; the method of retarding or advancing the ignition has to be applied to this mechanism, which needs also provision to prevent an accident, should the motor backfire. All of this constitutes a certain difficulty, and adds to the cost and care of a motor. It is, however, perhaps the most satisfactory form of ignition, and as such is adopted in most high-class cars on the Continent.

At the Standard Depot.

J. W. Chisholm, of the Standard Automobile Company, 136 West Thirty-eighth street, New York, is preparing for an active spring campaign with the Decauville and American cars, for both of which lines he has the agency. The American cars will be exhibited at the Eastern show by the makers, but Mr. Chisholm will have a special display of two Decauvilles, one of eight, the other of ten horse-power, in a separate space.

Receiver Still Mum.

Receiver Brownell of the Taunton (Mass.) Automobile Co. says that no figures of assets and liabilities can yet be given out regarding the affairs of that company. Nor will he say whether or not its continuance is likely.

Open for an Agency.

The Metropolitan Motor Car Co., which conducts an up to date automobile station at No. 164 East Fifty-seventh street, New York City, is open to taking on the agency for one or two good makes of cars.

Two new Types of Closed Cars.

Two entirely new vehicles which will almost certainly attract a great deal of favorable attention and meet with large sales are just being marketed by the Electric Vehicle Co. of Hartford, Conn. These are coupes of similar design and construction, with the exception that one is operated from a driver's seat at the rear, while the other is driven from the inside, dispensing with the necessity of a separate operator. Both of these vehicles are built exclusively for private service.

The passenger compartment of the rear

driven model is furnished to meet every requirement of elegance and luxurious taste, and regularly accommodates two occupants. If additional seating capacity is required a hinged seat forward, facing the main seat, may be lowered and brought into service. The location of the operator at the rear leaves the forward view from the compartment entirely unobstructed, a feature which makes the vehicle an especially desirable one for sightseeing or pleasure driving at times when the use of an open carriage might be undesirable. In pleasant weather the windows in front and in the doors may be dropped, making the vehicle practically

an open one. The upholstering is in claret colored broadcloth, and the interior furnishings include silk curtains, electric light in dome fixture controlled from the inside, card case with memorandum pad, a mirror and a speaking tube connecting with the operator. Every recent improvement is embodied in the electrical and mechanical equipment. The weight of the divided battery is distributed over both axles, and the battery compartments have removable coverings, so that the cells are accessible for inspection without removing the trays. The double motor equipment affords three speeds forward and three backward, with a maximum speed of fourteen miles an hour. There are foot operated regular and emergency brakes of the latest pattern, side lamps of the most modern style, and other standard features include a combination voltammeter, foot operated emergency switch and an electric alarm gong operated by foot push. The wheels are equipped with three-inch solid rubber tires.

The inside operated coupe is similar except that the controlling, steering and brake levers are within the compartment, and there are large side windows at the rear, making the sides practically all glass. This vehicle has been produced in response to a widespread demand for a new, thoroughly up to date, closed in electric automobile operated from the inside. It is peculiarly suited to physicians and others requiring a vehicle which may be used comfortably at all times without regard to weather conditions.

Showing the Olds's "Insides."

One of the exhibits at the forthcoming New York show that is certain to be interesting and instructive is now to be seen at the New York branch of the Oldsmobile Company, 138 West Thirty-eighth street. It is a regular stock Olds engine mounted on a low stand, with sections cut away so that every detail of every working part can be watched and studied. A battery is coupled on, and when the crank is turned by hand the movement of the piston inside the cylinder can be seen and the spark in the explosion chamber; it is easy to see how the valves work and just at what part of the stroke an early or a late spark occurs. This is the sort of an exhibit of which there can hardly be too many. The veriest numbskull could be made to understand by such methods just what it is all about and the why of it.

The Good Roads Committee.

A committee to look after matters pertaining to the National Good Roads Convention to be held in Chicago during the week of the automobile show was last week appointed by the executive committee of the National Association of Automobile Manufacturers. Messrs. John Brisben Walker, M. J. Budlong and J. Wesley Allison comprise the committee.

Kemble Coming Back.

Manager Kemble, of the Central Automobile Company, of 1,684 Broadway, N. Y., is due here next week on the Philadelphia. Mr. Kemble has been over to the Paris show seeking for things that are new and excellent in French manufacture. What he has done in the way of contracts will not be known until he arrives.

Remington Future in Doubt.

The future of the Remington Automobile & Motor Co., Utica, N. Y., was discussed at a largely attended meeting of the stockholders held last week. No action was taken, although it was the general opinion that a reorganization and continuance of the business was feasible.

REBER IS READY

Reading Manufacturer now has Cars on Market —Some of Their Features.

Designed upon the most approved modern lines, the gasolene car shown herewith, the product of the Reber Mfg. Co., Reading, Pa., bears every appearance of possessing quality of the kind that has made the Pennsylvania city's manufactures famous. The Reber company has been at work on it for some time, and now puts it forth with the full confidence that it merits the approval of autoists.

The concern has ample facilities for turning out a first class car. It occupies the plant of the Acme Mfg. Co., one of the factories of the American Bicycle Co., being, in fact, the legitimate successor of the former, James C. Reber being the ruling spirit in the present company, as he was in the former one. The car was designed by James G. Heaslet, whose experience in the gasolene manufacturing field has been long and extensive.

The car, which is fitted with a removable tonneau, weighs 1,650 pounds, has a wheel base of 6 feet 6 inches and a gauge of 4 feet 6 inches. It is propelled by a double cylinder vertical gasolene engine, placed in front under a bonnet, which develops 12 horsepower at 1,000 revolutions a minute. The transmission is of the slide gear type, having three speeds forward and a reverse, the gears being readily removed without disturbance. The speed is controlled by a throttle governor and positive lubrication is provided.

The cylinders are water cooled, the circulation being effected by a centrifugal pump. Although inclosed and running in an oil bath, the parts are readily accessible. Thirty-inch ball bearing wood wheels are used, the rear ones of which are driven direct by double chains.

A foot brake on the differential and hand emergency brakes on each rear wheel are provided, the brakes being double acting. The engine is released from the running gear by the application of either brake.

The frame is trussed, and the springs are semi-elliptical. A positive wheel steering is employed.

The Reber company will be ready to make deliveries by January 1.

Percy Owen's Good Work.

Parisian methods in handling advance sales have developed in New York. The 1903 20-horse power Winton touring car is selling at a premium. At least one has been thus sold. The 1903 models are not quite ready for delivery, but the forehanded Percy Owen has taken orders for forty-one of them. One of the purchasers was a prominent furrier of the city, who had a call on one of the first dozen machines. A few days ago the furrier sold his order claim at a premium to a man more impatient than himself.

The Harkness Way.

Although they are not yet being voted for at church fairs, there are several ways of obtaining an automobile beside making it. One real nice way is that in which H. S. Harkness recently acquired a 20-horse power Mercedes Simplex. Mr. Harkness, sr., preparing to go to California for the winter, decided to take a string of horses and not his automobile, which, by the way, is finished in a rich olive green and is about as handsome a machine as there is in New York City.

"I don't know what to do with the Mercedes," remarked Mr. Harkness, sr.

"Why don't you give it to me?" asked the son.

"But you have one."

"That makes no difference; I'd like to have it."

"Well, if you want it take it."

Now the handsome big machine is on the market.

Grout Tonneau Coming.

It is understood that a Grout tonneau car will be a feature of the Orange, Mass., concern's exhibit at Madison Square Garden. The car will weigh about 2,500 pounds, has large steam generating capacity, with a 12 horsepower engine. It will also be equipped with a condenser.

WHY HE INSURES

And in View of Present Conditions This Particular Insurance is Wise Precaution.

Referring to the comment in these columns last week on the advertisement in a daily paper of a 10 horsepower Peugeot car, in which the fact was mentioned that an accident insurance policy was included with it, a correspondent writes:

"I have a car of this make, which is my seventh automobile, I having driven a car for over five years. I have always insured all my cars against fire just as I insure my household furniture, house and other valuable possessions. The accident policy mentioned is not to protect the owner from loss or damage caused by smashups to his own car, but to protect him under damage suits which might be brought against him by owners driving fractious horses that might take fright at the automobile.

"The manufacturing concerns in which I am interested insure themselves in the same manner against lawsuits which might be brought against us by our employes who are sometimes injured in the performance of their duty, such injuries, however, being due to carelessness, yet at the same time shyster lawyers are always found in abundance to undertake such suits for damages. A large number of my friends carry accident policies to protect themselves in the manner I have stated. It does not mitigate in any degree against the automobile because such policies are carried by the owners. Any party purchasing the car advertised would naturally insure it against fire, and would have to pay the insurance just as the present owner has had to pay it. The accident insurance is, of course, optional with the owner, though I believe it to be a safe and conservative course to pursue so long as judges are found who will take the word of anybody else against that of an automobilist.

"You take the stand that by advertising the insurance policy the owner has overcome to a certain extent the dangers of automobiling. You might as well draw the conclusion that it is dangerous to live because so many people carry accident policies against injuries in riding on trolley cars, trains, steamboats, etc., and I do not therefore think your ground well taken in regard to it nor your criticism quite just."

Foul Weather Protection.

That the automobile is an all season, all weather vehicle is evidently an article of faith with the Automobile Equipment Co., Indianapolis, Ind. Rain aprons of all shapes and sizes, chain boots, engine cases, antifreezing compounds, winter oils, etc., are timely articles described in a little pahphlet got out by them. It bears the catch phrase, "'Tis an idle sheet does no one good."

New Panhard Carburetter.

In throttling a motor with inlet valves actuated by suction, it is a matter of great difficulty, if not an impossibility, to regulate by hand the admission of air to the mixing chamber in a way to secure an absolutely uniform mixture when the motor is rrunning at far below its normal speed.

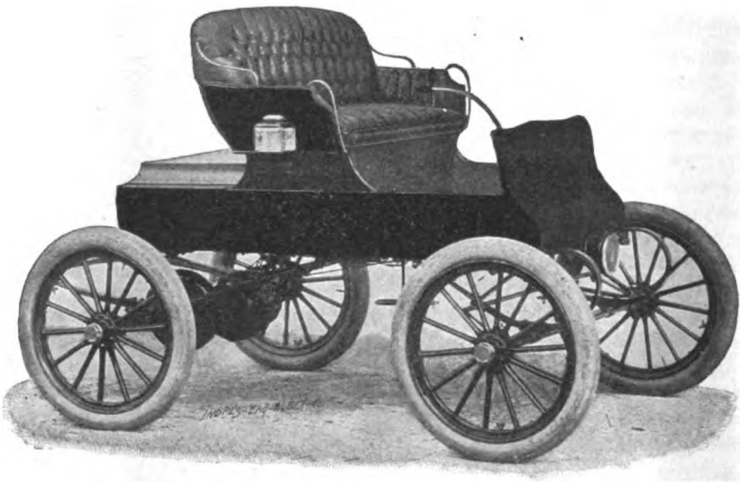
To avoid this inconvenience, Major Krebs, director of the Société Panhard et Levassor, has designed a new system of carburetter, in which the admission of air is regulated automatically by the engine, so that, as the mixture is always the same, and only varies in quantity, the motor will run at a low speed without danger of stopping through the admission of poor gas. This carburetter is regarded as of so much importance for the economical and efficient working of a motor that it was recently described before the Paris Academy of Sciences.

As will be seen from the accompanying drawing, it is designed in three parts. The first consists of an air inlet A communicating with the mixing chamber C. The spray nipple D descends into the receptacle E, which communicates with the float chamber. The second part forms a regulator consisting of a piston F moving in the cylinder G. The piston rod H is actuated by the centrifugal governor of the engine. The cylinder G, moreover, is in communication with the motor cylinders by the port I and the pipe J.

The third part is the extra air inlet, consisting of another piston K in the cylinder L, which communicates with the chamber C. The piston K opens and shuts the ports M M in the cylinder L, and the rod R is joined at its upper extremity to a piston P of smaller diameter than the large cylinder O

in which it moves. The periphery of the piston P is connected with the sides of the cylinder by a loose elastic diaphragh Q. A small aperture S admits air above the piston and diaphragm. The piston is kept in position by a spring N. Its operation is as follows: The piston F varies in travel according to the speed of the motor, the suction of which draws spirit through the pulverizer D and air through the orifice A, and at the same time tends to draw down the piston K, and uncover more or less the air ports M M, which are closed when the piston P is kept up by the spring.

When, therefore, the motor is running at nigh speed the piston F has a long travel and takes in a large quantity of spirit, but at the same time, as only a small fixed quantity of air is admitted through A, the piston K is sucked down to uncover the ports M M, which admit the necessary quantity of air for the mixture. As the motor slows down, the piston F, actuated by the governor, has a shorter travel, and the ports M M are only partially opened during suctional strokes; and when the piston F is at its shortest travel, the suction is insufficient to overcome the resistance of the spring N, with the result that the ports M M remain closed, and air is only admitted through A in quantity proportionate to the smaller admission of spirit through D. The air is thus kept strictly proportionate to the spirit, and the mixture is uniform at whatever speed the motor may be running.



Recent Incorporations.

Yonkers, N. Y.--The Turbine Electric Truck Company, with $100,000 capital, to make electric motors, etc. Directors, J. D. Sullivan, H. D. Crippen, J. J. Crippen, William C. Dodge, New oYrk; F. A. Curtiss, Nutley, N. J.

Jersey City, N. J.—Thermobile Co. of America, with $1,000,000 capital; to build and deal in automobiles, motors, etc. Corporators—William H. Lake, Z. Wirt and D. M. Bell, all of Chicago.

SYRACUSE CLUB ACTIVE

Selects an "Official Attorney" and Starts Plans for Road Reform and a Race Meet.

That the Syracuse (N. Y.) Automobile Club is very much alive and aggressive these days was convincingly demonstrated last week. Arrangements for the annual meeting and banquet, to take place at the Yates House on January 5, were made, and the devising of a plan for the betterment of roads and for obtaining the permission of the State Fair Commission to run a race meet next September in conjunction with the fair set about.

A good roads committee, with George S. Larrabee as chairman, had been appointed at a former meeting, and an official attorney, Henry Waters, was selected. An organized effort for the improvement of the neighboring roads will be begun at once.

The plan is to compel the toll companies to live up to the charters by which they control the roads—to force them, if they will not do it of their own free will, to expend the greater part of the earnings of the roads upon improvements, or at least enough to make them reasonably good. If this plan does not succeed the club will be a factor in a fight for State roads running parallel to the present toll roads.

The toll roads will be asked to fall in line with the farmers, the automobilists and the Good Roads Commission in the interests of better highways, as covered by the Rigbie-Armstrong bill, Chapter 115 of the Laws of 1898, by which a portion of the expenses for the improvement of the roads is paid by the State.

Chairman C. A. Benjamin, who, with Secretary Frederick H. Elliott, compose the committee which is seeking the sanction of the State Fair Commission for an automobile day at the fair, made the statement that the club's request will be presented to the commission at a meeting to be held in Albany this week..

Given Justice in Jersey.

It is a genuine satisfaction to set one common sense decision in an automobile case against the multitude of outrageous ones that have been rendered in the last year. At Hackensack, N. J., last week Richard M. Willis, a wealthy resident of Englewood, was defendant in a suit for damages brought by Herbert Quinting and tried before Judge Dixon.

Quinting testified that Willis's auto scared his horse and his wagon was upset, causing injury to his wife and himself. Evidence for the defence showed Quinting was more frightened than his horse, which he drove into a ditch, causing the wagon to upset. Mr. Willis stopped his machine, helped Quinting and his wife from the wreck, ordered a carriage to take them home and paid for all damage done the harness and carriage. The jury non-suited Quinting.

Stewart Rushes Eagle Rock.

After standing for more than a year at 2 minutes and 43 seconds, a new record that will probably hold for a long time was made on Eagle Rock Hill last Tuesday when W. J. Stewart, of the Automobile Club of New Jersey, negotiated the mile long ascent in 1 minute and 53 seconds, a cut of just 50 seconds.

"The record is official in every way," said Stewart to the Motor World man just after the ride. "I obtained sanction from the A. C. A., and had a corps of officials, timers, etc., present. The road was in good shape, and, barring a nasty head wind on one part of the hill, the conditions were nearly ideal. I think the mark set will stand. It is so much better than anything I have been able to do—although I have made several cuts of five and ten seconds—that I think it has been put where it will stay."

It will be recalled that on Thanksgiving Day, when the New Jersey club held a hill climbing contest on Eagle Rock, Stewart's time of 2:53 was the best of the day, although a Stevens-Duryea car was at first credited with having covered the distance in 2:45. Afterward it was announced that an error had been made and that the correct time was 3:45. On both occasions Stewart, who is the chairman of the A. A. A. racing committee, used a steam car.

Butler Watched at a Dinner.

Last Monday night a "reunion dinner," arranged by a few of the participants in the reliability run of Ostober 9-15, was partaken of at the New York Athletic Club, and a most enjoyable evening was spent by nearly three score of the contestants and observers. The dinner was made the occasion of a presentation to Secretary S. M. Butler of a very handsome gold stop watch, tendered as a mark of the appreciation of his services in connection with the run. Winthop E. Scarritt acted as toastmaster, and the following themes were responded to in a happy vein: "The Automobile Club of America," President A. R. Shattuck; "The Reliability Contest," John A. Hill; "The Contestants," Percy Owen; "The Observers," C. H. Gillette; "The Press," Angus Sinclair; "Free Lances," W. J. Stewart, E. E. Britton and J. Dunbar Wright.

Will Have Upright Engines.

The gossipy little bird that carries news has a twitter to the effect that the Winton machines which will be built to compete for the Bennett Cup will have four-cylinder engines and that the engines will be upright

Motor League's Annual Meeting.

The annual meeting of the American Motor League will be held in this city on Thursday, January 22, during the Madison Square Garden Show. The election of officers will take place and routine business transacted.

CONVERTED TO FURS

Derided Them at First but one Ride in Open Country Dissipated all Doubt.

Furs look just as good as they feel these wintry days, and the more the autoist is able to pile on himself the better he is pleased.

"I really believe they take delight in zero weather," exclaimed a man who had been invited to ride with a friend in a big touring car, "and would be thankful if they had a blizzard every week or so. Then they would be able to put on a few more thicknesses of furs.

"When I came to take my ride I was, as I thought, pretty well prepared for it. A big, warm overcoat of Irish frieze, heavy gloves and a cap that could be pulled down over my ears—that seemed to me all that was necessary, even though the thermometer was hovering around ten degrees above zero. But no. Nothing would do but I must put on half a hundredweight or so of wraps right off the reel. The pitying look my friend gave me was enough to make me submit tamely.

"And, to be perfectly candid, it did seem all right after I got into the togs. I had only to sit down in a roomy, comfortable seat, so that the weight and bulk of the covering did not inconvenience me.

"When we got out in the open country it soon became plain that I was weatherproof. There was a pretty stiff wind blowing, but I was so bundled up that I did not feel it and the cold never reached me at all.

"So I guess these furs, etc., are all right, although they do look theatrical and seem as if they were intended mainly to make their wearers look 'sporty.'"

Adams Again Heads Long Islands.

On Wednesday evening, December 17, the Lond Island Automobile Club held its annual meeting and dinner at the Lincoln Club, Brooklyn. The following officers to serve for the ensuing year were elected: President, L. R. Adams; vice-president, Lawrence Abraham; secretary, Read Halliday; treasurer, Edwin Melvin; governors, Adolph Mollenhauer, Read Halliday, Nathaniel Robinson; L. A. Hopkins; F. G. Webb and Lawrence Abraham.

In President Adams's case the club returns to its old love, he having been its first president, serving until President Grant was elected last year.

About twenty-five members sat down to the dinner. A. R. Pardington acted as toastmaster. L. R. Adams spoke on "The Future of the L. I. A. C.," F. G. Webb talked on "The Club and Its Past," W. W. Grant, the retiring president, spoke on "The Present." Conspicuous in the dining hall were three of the prizes awarded by the club at its races on the Brighton Beach track last August.

Nickel Steel for Motor Cars.

Nickel steel, in automobile work, for rivets, pins, exhaust valves, rods, shafts, axles and springs is recommended by a transatlantic writer. Its chief merits are (a) Stiffness or resistance to deflection under impact, and toughness or resistance to fracture under repeated impact. Steel with 3 per cent nickel shows 48 per cent greater stiffness, and 45 per cent greater toughness, than similar carbon steel. With 5 per cent nickel the difference is even greater. (b) Elastic limit.—The elastic limit of mild and medium hard steel is usually taken as 46 to 50 per cent of the ultimate strength. With 3 per cent nickel steel it is stated to be 63 to 74 per cent. (c) Tenacity.—In simple carbon steel, a crack once formed quickly develops, and the material breaks short. In nickel steel the rend is gradual. The latter gives warning, the former does not.. (d) Temper.—Nickel allows a reduction of carbon, makes the steel more sensitive to temper and facilitates the tempering of irregular shapes. Where a forging is too complicated for oil tempering the requirement may be met by using a somewhat softer and tougher steel and introducing from 3 to 4 per cent nickel. (e) Resistance to oxidation and heat.—An 18 per cent nickel alloy is said to be practically incorrodible. A high nickel alloy also withstands well the action of heat. (f) Antifrictional properties.—The nickel renders the wearing parts of machines which run on other parts less liable to cut, the nickel apparently having the property of making the surfaces smooth with wear, even though not always properly oiled.

India a Land of Promise.

There is said to be a magnificent future for the motor car in India. The climate kills the individual horse and demoralizes the breed. Added to this, a high speed car on the splendid wide and unfrequented Indian roads would furnish an ideally cool recreation. Everybody in India has "money to burn," railway travelling is horribly hot. India is a country of magnificent distances, and nobody shrinks from long journeys. In fact, the country, its customs and its roads fit the car better than any other corner of the globe.

DeDion's Big Business.

Some idea of the magnitude of the De Dion-Bouton business may be obtained from the statement that the 1902 output of De Dion-Bouton cars and frames approximated 2,000, and that of engines 5,000. The total number of cars or frames made to date is 6,000. The total number of motors made to date is 33,000; this, of course, includes motors of all kinds, from the old 1¼ h. p. air-cooled tricycle engines of some years back. The number of workpeople employed is 2,150, independent of office staff, which is about fifty.

Court Sanctioned Law's Violation.

In granting special dispensations for exceeding the speed limit England has set the fashion. In connection with a recent murder trial at Ipswich the judge and jury expressed a wish to see certain letters written by the prisoner during the period of his incarceration. In order to obtain these it was necessary to send to Peasenhall—a distance of twenty-seven miles. Counsel for the defence promptly requisitioned a motor car, which started with the messenger at 11:30 a. m. The journey to Peasenhall and back to Ipswich was made under three hours, the return being accomplished in just over the hour. This speed was made possible by a special permit for urgency and a tacit understanding that no penalties should attach to violations of the law as to the speed of motor cars.

In this progressive country physicians going on a "hurry call" in the city must not go faster than eight miles an hour—if they use an automobile. If they drive a horse hard enough to cripple him it is another matter.

Salt as an Anti-Freeze.

An effective and very cheap anti-freezing solution is said to be made by putting three-quarters of a pound or thereabouts of ordinary salt well dissolved in each gallon of water carried by the car. Salt only costs about a cent per pound, so the expense is

FOR RURAL DELIVERY USE

Unofficial Test Shows the Value of Motor Cars for That Public Service.

It is just beginning to be realized what a splendid field the rural mail delivery service affords for automobiles. No horse can compare with the motor vehicle in either speed or endurance, and the balance inclines the same way as regards economy.

Out in Montevideo, Minn., one day recently, an Oldsmobile was put on the route of a horse drawn vehicle, and the trip is thus graphically described by F. E. Sharlow, the owner of the car:

"Not long ago the rural mail carrier of Route No. 3 asked me to take him on his regular twenty-six mile trip with my Oldsmobile. He wanted to give his horses a rest and also see whether much time was to be gained by delivering the mails with a horseless carriage.

"The morning was cool, with threatening clouds overhead, and I was not pleased at the outlook, for rain seemed almost certain. While I had confidence in the ability of the machine to go through almost anything, I was not prepared for all kinds of weather on this occasion, and hesitated somewhat before deciding to help him out of his difficulties. It was a generous thought; for I felt that I might get into difficulties of my own. However, I would have company in pulling him into it with me. At 8 a. m. I was on hand, after replenishing the gasolene, water supply, oiling up, etc.

"On arriving at the postoffice I found the carrier equally as prompt, so we lost no time in getting off at 8:03. Uncle Sam, as you know, takes the right of way over everything, so we didn't stop to observe speed limits, and soon had the machine doing twenty miles an hour through the main street of the village. Over railroad tracks, through timbered sections, across bridges, along roads good and bad, uphill and down, the faithful little Oldsmobile carried its burden of 400 pounds in steady and speedy fashion.

"My companion had arranged his bundle in five smaller packages to make sorting easier en route, and yet he was kept busy with both hands and teeth in order to have each farmer's mail ready for the box when we would reach it.

"First I would turn up toward the box on the right, pull it open, in would go the mail, shut it again and off to the next, perhaps giving my friend an opportunity this time to exercise his skill in doing the act quickly.

"Well, we kept this up, box after box, yes, seventy-five of them, starting and stopping, and just once in our hurry did we put mail in the wrong box, which necessitated our turning back to replace it with the proper bundle.

"Why he selected the busiest morning of the week for this trial I do not know. The horses would have enjoyed so many short rests—I didn't, for I was anxious to make as good time as possible.

"Such a morning surely gave us a test of what the machine would do any other day of the week, and, too, the roads were not the best. At one place, a new turnpike extending one-half mile, was in construction. Here we were compelled to go out in the grass, through the slough over which the new road was building. Talk about rough places, well, we won't try to describe them here. Again, three miles of sandy road, three to six inches deep, made speeding impossible. The best roads we found were tracks made by one wheel following another without a sod turned or work of any kind. Where they had ploughed up and scraped into the centre, at some time or other, the going was quite rough and rutty. Such roads are a waste of time and money. What they should do is haul on the road, without ploughing it, until they are able to construct properly.

"We were bothered by teams but very little, however; it is aggravating to get behind a string of heavily loaded wagons when the width of the road will not permit you to pass, and still more aggravating when the road is smooth and level.

"As we pulled into town we looked at our watches again to note the time we had made. The hands pointed to 10:29 a. m. This was two hours and thirty minutes better time than the carrier had ever covered the territory with team.

"I think the test a creditable one, and was made without a missing, explosion or hitch of any description. At one halfway house we added a little cooling water and oiled a few bearings, not from necessity, but to be on the safe side. The Oldsmobile was in service the balance of the day and evening, and is always ready just for such trips."

Cuba as a Market.

Although automobilism is in a very backward state in Cuba, there is an opportunity to do considerable business there. Such is the conclusion of George M. Dickson, who has just returned from a trip to the island, undertaken in the interests of the National Vehicle Co., Indianapolis, Ind., where he secured satisfactory representation for his concern. He says there are very few automobiles in use. Local conditions, customs duties and lack of charging facilities prevent their extensive use, although the future trade at Havana and other points should be considerable. The entire city possesses but twelve or thirteen automobiles, several of them being old patterns and out of commission; there are but two or three up to date machines in the city.

Darracq's Big Profits.

Just under half a million dollars is said to have been cleared by the Darracq Co. on the year's business.

7000 MILES ON ONE SET

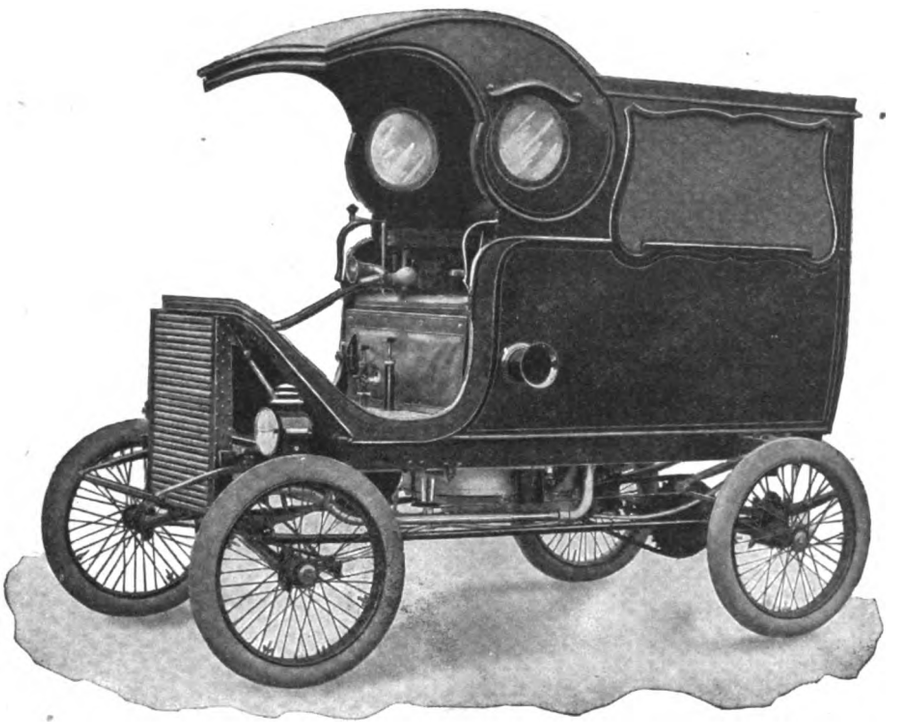
And Affidavits are Ready to Back it up—The Batteries as a Scapegoat.

If there is any scapegoat about the motor vehicle, it is probably the battery. Although usually unjustified whenever a man cannot locate a cause of trouble, he promptly suspects if he does not outwardly blame the battery. This weakness applies not only to the car owner, but to many supposed expert repairers; in fact, one of them recently laughingly admitted that it was common practice when "stumped" to throw the blame on the batteries, "and," he added, "it really is queer how often a new set will make things rights."

When this remark was repeated to William Roche, the well-known maker of Autogas batteries, he stated that he was not at all surprised.

"They have to appear wise," he said, "and I suppose it is as easy to blame the batteries as to blame anything else. But the right batteries are as dependable as any other part of the machine. The trouble with too many people is that while they will pay or ask several hundreds or several thousands of dollars for a car, they will try to save a few cents when it comes to the purchase of the batteries. You may take my word for it that any man who is willing to pay the price can get a good battery. Why, I several months ago sold a set to Mr. Harlan W. Whipple and up to the time of the New York-Boston reliability run he had got 3,800 miles out of them. When he entered the run he bought a new set. After it was over he replaced the old one, and so far as I know, he is still using it. I sold another set to a Wall street man, Mr. Deisinger, and he used them for 7,000 miles. Yes, sir; seven thousand miles, and Mr. Deisinger told me that if at any time I wanted affidavit to the fact he would execute one. I repeat that any one who pays the price can obtain a good battery without any trouble at all."

Here's an Oily Guess.



"What is the annual consumption of oil?" asks the Car, and goes on to say: "It reaches the respectable total of 630,000,000 tons, of which 170,000,000 are consumed in the United States, 148,000,000 by Great Britain, 74,000,000 by Germany and 38,000,000 by France. As 500 grammes of oil (1 1-10 pound avoirdupois) produces an energy of one mechanical horsepower, and as this equals in continuous effect the efforts of twenty-one men, it follows that the consumption of oil by the entire world permits of a power development of 1,238,000,000 horsepower, which equals the work of 26,000,000,000,000 men.

Royal Phelps Carroll will leave New York this week accompanied by his twelve-horsepower Panhard for a tour of several months in Italy, France and Spain.

The White Delivery Wagon.

Just prior to the reliability contest last October the White steam delivery wagon made its first appearance. Almost immediately two of these vehicles were started in the famous run to Boston and return, and the splendid showing they made is a matter of history. If any doubt as to the practicability of a vehicle of this sort had been entertained to that time it was effectually dispelled by this contest.

Launched thus quietly, the vehicle has in a short space of time demonstrated that it is the equal of the regulation White car in reliability and efficiency. More than this cannot be said.

This delivery wagon is intended particularly for the light retail trade, such as drygoods, laundry, mail service and small parcels of all kinds, the total of the load, aside from the driver, not to exceed 500 pounds.

The total weight of the wagon is 1,700 pounds. The carrying space in the body is 42 inches long by 44 inches in height by 32 inches in width, and its height is divided in the centre by a rack, which can be removed if desired. The wheels are 30 inches in diameter, and are fitted with 3½ inch clinches tires. The wheel base is 6 feet 9 inches, the tread is 54½ inches, and the total clearance from the dust caps on the wheels is 60 inches. The car is 9 feet 6 inches in length over all.

The engine and steam generator in the car are the same as in the regular White Stanhope, the arrangement being different, the engine being back of the generator, and is the latest style of encased engine. All these cars are equipped with condenser in order to avoid any appearance of steam in the crowded traffic, where they are certain to be used.

Glycerine to Prevent Freezing.

One part of glycerine to five parts of water is a mixture that has a freezing point of about 24 degrees Fahrenheit, and it would seem a suitable one, provided no deleterious action was established in the circulatory system by its use. In trial it has been found to attack rubber tubes used to connect various pipes of the system, causing their failure, but not to affect metal tubes.

While pure glycerine is decomposable by heat, this mixture will be found stable at any temperature short of the boiling point, yet it must not be supposed that when a glycerine solution has been put into the cooling system it is only necessary to fill it up with pure water to make up the loss through evaporation. While it is true that glycerine itself cannot be said to evaporate, yet it is carried off in minute particles in any steam which may be given off. Therefore, in the course of time, the proportion of solution would so alter that the freezing point would become higher, and unless more glycerine were added to make up for losses one might easily find the radiators frozen after a little extra frost.

About Picric Acid.

Less than a year ago it was asserted that picric acid might knock gasolene sky high, since which time nothing has been heard of it. Now a French chemist claims that five parts of a saturated alcoholic solution of this acid to ninety-five parts of gasolene produces an excellent working mixture, requiring considerably less air for its combustion and saving at least 30 per cent per horsepower an hour. Also that the resulting exhaust is almost odorless. So gasolene would still seem to be safe, as 5 per cent of picric would not cut much figure any way.

Letts Explains Some Things.

W. M. Letts, of London, who sells Locomobiles to confiding Englishmen, is in New York for a short stay, but will return to London in time for the show. Mr. Letts offers the interesting statement that the British are taking more kindly to American machines and that there is plenty of room there for good machines. He says that any kind of a good machine will sell there, but still he sold as many Locomobiles this year as he did last. The chief demand in England formerly was for French cars, but this, he says, is now being changed and the Napier is becoming the most popular, because of S. F. Edge having won the Bennett Cup with one.

Concerning the tale of the tubs told recently in The Motor World, in which an Englishman explained how ingeniously Mr. Letts avoided stops in the endurance contest by having his carriage circle about tubs while taking water, Mr. Letts said that it was all wrong. The rules prohibited the use of tubs, so he used pails, but they were not set in a row along the road, he said. Mr. Letts took exception to the story, but did not explain just how he did manage to get a car through and get a certificate.

Lubrication in Cold Weather.

Cylinder oils which have been found to feed perfectly through drip feed lubricators and their leads during the warmer months of the year will, in many cases, require to be replaced by somewhat thinner oils when the temperature is low, particularly if the car is stored in a cold place and the oil tank is so situated that it is not affected by the heat radiated by the engine or water tank. Cylinder oil, which, in use with drip feed cylinder lubricators, dripped nicely at nine to ten drops a minute in warm weather, will only feed at half that speed in colder weather, and it is necessary to use a thinner variety. Automobile owners should look to their lubricators and verify their action, watch in hand, now that the winter is here.

How They Help Fire Engines.

The boilers of the steam fire-engines used in Hanover, Germany, while they are in the stations are kept continuously heated by gas. The steam is maintained at a pressure of nine pounds per square inch. On the engine is a tank containing about twelve gallows of methylated spirit connected with a cylinder of liquid carbnic acid. The pressure exercised by this drives the spirit into the furnace on the sounding of the fire alarm, and in six minutes brings up the pressure of steam to 84 pounds. Heating the furnace during the run to the scene of the fire does away with noise and smoke. Immediately on arrival at the conflagration the ordinary fuel is used to maintain the steam pressure.

For the Nice festivities next spring a French concern, Gobron-Brillie, are said to be building cars fitted with 100 horsepower engines, four cylinders and eight pistons.

Is There Room for her?

The feminine professional chauffeuse and mecanicienne—is there a field for her? Can she be entrusted with the task of driving and generally caring for the motor car of a fellow woman with advantage to the latter as well as herself?

These questions are brought up by the plea of an Englishwoman to be given a trial in such a position.

Hitherto her family circumstances have been easy and comfortable. She has driven her father's car during the past three years, but his sudden death and the overwhelming fact that they have long been "living above their means" make it imperative for all who are of an age to do so to turn out and earn their own living.

"I have been trained to nothing which would gain me a decent salary," she says, 'but I understand our car through and through, and if I could hear of a probable post I would also try and get permission to take a course of practical repair-doing at some motor works.

"I have a natural taste and talent for mechanics, and with a little more training in the technical side of the car am sure that I should make an excellent mecanicienne and driver. I must live an outdoor life, and I do not see why a girl chauffeur should not be as acceptable at a country house as a girl gardener, many of whom find well-paid employment. All the three years I have driven the car I have never had one accident, and I am 'just as good as a man' at repairing tires."

Compression in High Altitudes.

A motor which shows a certain compression at sea level will not, if carried to a higher altitude, show so high a compression, and the loss will increase with the height above sea level to which it is carried. The cause of this is obvious. Since the piston displacement is constant, a full charge of rarefied air, when compressed, will not register as high a gauge pressure as would air of greater density.

Since the spark ignites the mass of mixture immediately surrounding it first, and the resultant flame must be propagated throughout the entire mass before complete ignition takes place, an autoist suggests that several sparks occuring simultaneously at different points in the explosion chamber would be more effective than anything yet devised, especially in high speed motors.

His Idea of Price.

Being asked, "What do you consider a moderate price for a car?" one maker is said to have replied: "Any price is moderate for a machine that will take you in one day further than a pair of horses could pull you in two days and will go back over the same ground the next day, while your pair would be in the hands of a veterinary surgeon."

WEARIED OF WATERING

Tried Using a Collapsible Pail and a a Syphon; now Wants a Condenser.

"People advise me not to buy a steam car on account of the bother of filling the water tank so often," remarked a man who was about to become an automobilist to a Motor World representative, "but I can't see why that should be sufficient objection.

"They tell me that it takes, roughly, a gallon of water for each mile travelled, and that the water tank holds 25 gallons. Well, that is sufficient for 25 miles running; or, if you have to make a little allowance for the—well, the optimism of the salesman—we will say 20 miles. Now, why should there be any great objection to that? You can't drive a horse 20 miles without stopping to give him water and other things as well. And it is not often that you will want to drive more than 20 miles without stopping for something; and if you do stop what trouble is it to put in some water?"

Fortified by these self-directed arguments, the speaker bought his steam car. For a while he was taken up with the task of mastering the control of the car and of acquiring a fair knowledge of its construction, and so did not take any long runs.

When the period of his novitiate had passed, he approached the water filling task with enthusiasm. A collapsible pail was carried and used to transfer the water from the trough or other recepticle to the water tank. By and by this became a little bothersome, and he invested in a rubber hose and syphon. This was found a great improvement, as the water ran into the tank itself after the arrangement had once been connected and started. But it was rather a slow process, and by and by the autoist came to the conclusion that the hose was too small in diameter, so he got a bigger one, with the result that there was some improvement.

Meeting him the other day, the Motor World man brought the conversation around to the water filling point.

"Do you know," the autoist confided, "this water matter is about the worst thing in connection with the steam car. In fact, it is a confounded nuisance, especially in cold weather. I am looking into the matter of condensers, and if one can be fitted to my car I think I shall try it."

Have a new Carburetter.

Homan & Shulz, agents for the dapper Northern, at No. 34 West Thirty-eighth street, New York, have brought out a new carburetter for light cars, which looks more than good. Commendable enterprise on the part of the agents is shown by their willingness, when it is desired, to put their new invention on the Northern cars without extra charge.

Goggles for Town and Country Use.

Much fun has been poked at goggled automobilists, who are frequently accused of using eye-protectors because they like to make themselves conspicuous. Particularly is this true when in cities. As a matter of fact, the eyes need more protection in town than in the country. In town the dust is unwholesome and chemically injurious, and his dust is kept in perpetual circulation by the traffic; but in the country the dust (when there is any) is left behind, and a journey can be made without the use of glasses, until almost in town, when it is found that the eyes begin to "smart." Without goggles the eyes "run" continuously, and at the close of a long ride, and for several days afterward, grit is found exuding from the corners of the eyes, especially in the mornings, on awakening from sleep. The wearing of the glasses a portion of the day and then omitting to put them on might cause neuralgia, and therefore if one can travel safely without their absence causing inconvenience it would certainly be an advantage.

Carbonization of Lubricating Oils.

The question as to what the tendency of gas engine oil to carbonize should be attributed is an exceedingly difficult one, and suggests a prior question, viz., whether the carbon found in gas engines proceeds from the fuel (gas, oil or gasolene,) or from the lubricant. In the case of a gas engine the relations of gas and of lubricating oil used, gas being reduced to actual weight in accordance with its known specific gravity, are about 96 to 97 per cent of gas against the balance in lubricating oil. Analysis shows that the composition of town gas, or of gases from mineral oil or from spirit, closely approximate one another, viz., hydrogen, say 84 per cent, carbon about 16 per cent; and, on this assumption, it seems not unfair to suppose that the bulk of the carbonaceous deposits which are found in gas and oil engines is due to the fuel rather than to the lubricant.

To Discuss Debased Alcohol.

Many applications are being received for permission to take part in the forthcoming International Congress at the Paris Automobile Salon on the "Uses of Debased Alcohol." The chairman of the organizing committee calls the attention of applicants to the necessity of specifying the section in which they desire to be placed, viz.: automobiles, fixed motors, physics, chemistry and economical questions.

But it is the Proudest Moment?

"When a man has lain on his back on the ground under an automobile and has been thumping pipes and tightening clutches, with the oil, grease and water trickling down his neck, and he gets into the machine, if it goes it is the proudest and happiest moment that can come to any human being," is the way Frank Miller, a member of the Automobile Club of Bridgeport, Conn., sums the matter up.

CAN'T ABIDE CRANKS

User of Gasolene car Sight for a Substitute for Them in Starting.

"After all it is the little things that count," remarked a man actively identified with the manufacturing end of the industry. "A little defect or shortcoming will frequently irritate more than a broken shaft, a smashed wheel or some other serious trouble.

"To my mind the starting mechanism of a gasolene car is about the most indefensible thing about it. To have to get out a crank and wind up the machine every time you start is an infernal nuisance. Not even the insignificance of the mechanism redeems it. In the perfect car, the car of the future, it will have no place. Some one will come forward with a device that will make the starting as easy as pressing a button. That I feel as certain of as I do that the gas engine of that same future will be infinitely more flexible and controllable than it is at present.

"It positively makes me sick every time I have to turn the crank. It is the work of only a few seconds, of course, and when the knack is acquired there is no trouble to get explosions inside of half a dozen turns. But it is distasteful to me to think that every time that engine has to be started the crank turning process is necessary."

Phenomena of Ignition.

Referring to the temperature at which gasolene, vapor and air would ignite, the following phenomena is observable: 1st. Failure of gasolene vapor and air to ignite at even partial red heat. 2d. Ignition of lubricating oil under similar conditions. 3d. Automatic ignition of petrol charges in water-cooled motors at comparatively low temperature.

The conclusion to which these phenomena point is, that the automatic ignition of gasolene charges is due, not to compression or temperatures attainable under running concooled motors because the oil used has a comparatively low flash point; and it occurs in air-cooled motors at a higher temperature because the lubricant employed has a higher flash point.

The arguments that ascribe premature ignition to the flashing or burning of the lubricant, might be countered by ascribing it to incandescent carbon in the cylinder or ports. It is quite possible that this also may be a cause of pre-ignition. But it does not fully meet the case. As incandescence would be continuous, it should also lead to continuous pre-ignition; it should make pre-ignition independent of the amount of lubricant used, but the reverse is the case; it should confine premature explosion to cases where such deposit is present, but this is not in accordance with fact.

Touring in Algieria.

There seems a likelihood of the automobile becoming for pleasure purposes at least a "ship of the desert." Some time ago an enterprising French promoter of tours mapped out a motor car "circuit" through the North African States. Now, writing from Mustapha, in Algeria, to the president of the Touring Club of France, M. Le Normand de la Fosse states that the project is in good shape for being realized. The suggestion originated with Baron de Crawhez and the "winter committee" of the French colony on the southerly shores of the Mediterranean. Already steps have been taken to secure the patronage both of the French Automobile and Touring Clubs. M. de la Fosse states that the Prefect of Algiers has given a report in favor of the "Circuit"; he is awaiting a report from the Prefect of Oran, which has been laid before M. de Maisonseul, the President of the Court of Assizes. M. de la Fosse has further entered into negotiations for the chartering of a vessel that will suit admirably for the transport of the tourists and their cars. This was the greatest difficulty to be overcome. If the "Circuit" is duly authoized on both sides of the Mediterranean M. de la Fosse believes that numerous tourists and constructors will respond to the appeal for support. The advent of the automobile in the domain of the sons of Ishmael is one which will cause many of the gray-beared Arab sheiks to open their eyes with wonder.

To Help Steamers Start.

Should an engine prove refractory in starting in cold weather, gasolene squirted into the cylinders very often overcomes the difficulty; or, if the mixing chamber has a removable top with a cone, warming up the cone will nearly always effect a ready start.

The Week's Patents.

715,784. Puncture Healing Compound. Lewis C. Grant, Cleveland, Ohio, and Nelson B. Chester, Caldwell, N. J. Filed August 15, 1902. Serial No. 119,785. (No specimens.)

Claim—A compound for the purpose described composed of asbestos, borax, mica and cork, substantially as set forth.

715,954. Vibration Equalizing Support for Motors. Adrien Bochet, Paris, France. Filed March 23, 1901. Serial No. 52,501. (No model.)

Claim—1. A motor vehicle having longitudinal frame members connected with the axles thereof, transverse supports connected with said frame member, a motor mounted in said supports and adapted to swing laterally, said motor being provided with laterally arranged supplemental supports loosely connected therewith and with springs which are connected with the axle centrally thereof, substantially as shown and described.

716,031. Pneumatic Tire. Henry N. B. Good, London, England. Filed March 17, 1902. Serial No. 98,574. (No model.)

Claim—1. In a pneumatic tire, the combination with the outer flexible covering, of an inner inflatable tube provided with a plurality of slits, valves inserted in said slits and secured to the interior surface of said tube, and means for closing said valves for separating said inner tube into a plurality of inflated compartments.

716,065. Automobile. Joseph Ledwinga, Chicago, Ill., assignor, by direct and mesne assignments, to Imperial Electric Motor Co., Chicago, Ill., a corporation of Illinois. Filed January 31, 1902. Serial No. 92,050. (No model.)

Claim—1. In a vehicle, the combination with one of the wheels thereof of a motor member arranged at the inner end of the wheel hub, means for mounting the motor member so that it in effect forms a single unitary structure with the wheel axle, and a pivotal connection between said unitary structure and the axle member, whereby the motor member and wheel together can be turned relatively to the axle member, substantially as described.

716,076. Brake. Leo Melanowski, Cleveland, Ohio, assignor to the Winton Motor Carriage Co., a corporation of Ohio. Filed June 6, 1902. Serial No. 110,525. (No model.)

Claim—1. A brake of the character described, including a stationary member, a brake band, a movable operating member connected directly with one end of said band, the opposite end of the band laterally movably connected with said stationary member, and a coacting surrounding brake member.

716,083. Tire Repairing Compound and Process of Preparing Same. Milton McWhorter, San Francisco, Cal., assignor of seven-tenths to James Uhler Hastings, Edward McGary and Usher L. Davies, San Francisco, Cal. Filed May 26, 1902. Serial No. 109,077. (No specimens.)

Claim—1. A tire repairing compound consisting of a residue derived by distilling asphaltic petroleum below 350 degrees Fahrenheit, of crude rubber and essential oil of sassafras, substantially as herein described.

716,099. Tire for Motor Vehicles. Max Polack, Waltershausen, Germany. Filed June 9, 1902. Serial No. 110,942. (No model.)

Claim—1. A vehicle tire having a portion of its sides constructed slightly convexo-concave in contour, the outer face of said convexo-concave portion adapted to straighten when the tire is compressed.

716,113. Driving Mechanism of Motor Cars. Albert Schmid, Havre, France. Filed January 28, 1902. Serial No. 91,607. (No model.)

Claim—Motor car driving mechanism comprising an internal combustion engine, a dynamo having a double wound armature and driven by said engine, said dynamo having two commutators and two sets of brushes, a pair of electric motors connected to the dynamo and arranged to drive the vehicle, and a controller arranged to change the connections of the dynamo, substantially as described.

716,168. Vehicle Brake. Augustus A. Ball, jr., Lynn, Mass., assignor to Elihu Thomson, Swampscott, Mass. Filed January 27, 1902. Serial No. 91,299. (No model.)

Claim—1. In combination, a revolving element, a brake therefor, a motor which is separate from the said element for applying the brake, a body of non-compressible fluid which is independent of the motor for regulating the setting of the brake, and a manually actuated device by means of which the fluid is controlled.

716,183. Steering Column for Automobiles. Henry B. Brazier, Philadelphia, Pa. Filed August 13, 1902. Serial No. 119,490. (No model.)

Claim—1. In a steering column for vehicles, a standard or support, means for operating the steering mechanism, means for controlling the mechanism for changing the speed of the vehicle, means for operating the governor, means for controlling the circuit breaker, and means longitudinally movable within the others for actuating the alarm, said parts being arranged adjacent to each other and freely movable with respect to each other, and means for counterbalancing the weight of the speed controlling means.

716,314. Igniter for Hydrocarbon Engines. William W. Tuck, Richmond Hill, and August Wassmann, Astoria, N. Y., assignors to Abbot Augustus Low, Brooklyn, N. Y. Filed December 18, 1901. Serial No. 86,356. (No model.)

Claim—1. The combination with the ignition chamber of a gas engine, of an ignition plate disposed centrally within said chamber, with its outer edge substantially concentric with the walls of said chamber and having integral extensions passed through insulated openings in the opposite walls of said chamber, and electrical connections with the outer ends of said extensions, substantially as and for the purpose specified.

716,143. Motor. Basil V. Szabo, Chicago, Ill., assignor of two-thirds to Ferdinand Siegel and Joseph Alexander, Chicago, Ill. Filed March 5, 1901. Serial No. 49,833. (No model.)

Claim—1. In a rotary motor, an axle or shaft having two concentrically disposed flanges thereon, a drum eccentrically fixed between said flanges, a cylinder inclosing the space around the drum between the flanges and having bearing on the shaft or axle outside of the flanges, and movable plates held against the surface of the drum and fitted closely between said flanges.

A Fable and its Morals.

Once on a Time there were Two Young Men, each of whom Bought an Automobile.

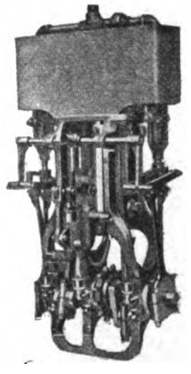
One Young Man, being of a Bold and Audacious nature, said:

"I will make my Machine go so Fast that I will break all Previous Records."

Accordingly, he did So, and he Flew through the Small Towns like a Red Dragon Pursuing his Prey.

Unheeding all Obstacles in his Mad Career, his Automobile ran into a Wall of Rock, and was dashed to Pieces. Also, the young Man was killed.

The Other Young Man, being of a Timorous and Careful Disposition, started off with great Caution, and Rode at a Slow Pace, pausing now and then Lest he might Run into Something.



The Result was that Two Automobiles and an Ice Wagon ran into him from behind, spoiling his Car and Killing the Cautious Young Man.

Morals: This Fable teaches Us, The More Haste the Less Speed, and Delays are Dangerous.—Carolyn Wells, in Smart Set.

"Chauffeur" too Much for Berry.

The word "chauffeur" has aroused the ire of Alderman Berry, of Kansas City, Mo. It is too "Frenchy" to suit him. In a discussion of an ordinance pending before the board of which he is a member the belligerent lawmaker wanted an amendment to the ordinance designating the operators of the machines as "gripmen."

"That is something easy," said Berry, "and hasn't got any frills to it."

The WHITE Steam Carriage

AN AUTOMOBILE THOROUGHBRED.

In the 500-mile Reliability Contest from New York to Boston and return, arranged by the Automobile Club of America, three **WHITE STEAM STANHOPES** covered the distance without stop or trouble of any kind—a perfect performance.

The White Steam Generator is absolutely non-explosive, gives pressure in five minutes from cold water, and once in motion is self-regulating. In touring, the **WHITE** will make 100 miles without adding a drop of water or fuel to the original supply.

Write for full particulars, including Prof. Thurston's report on our steam generator, and the official reports of important endurance contests.

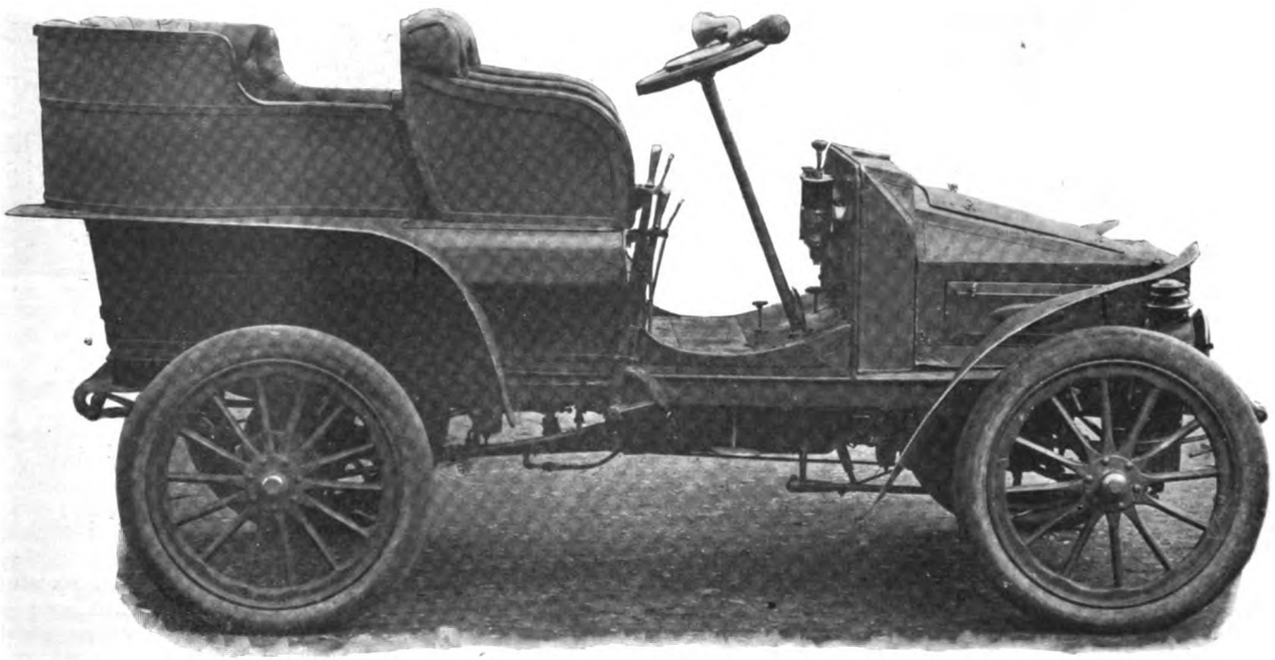
A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS.



Volume V. New York, U. S. A., Thursday, January 1, 1903. No. 14

WHITE SPRINGS A SENSATION IN STEAMERS

Departs Radically From Preconceived Notions and Produces a Car Looking so Like the Gasolene Model as to Render Recognition Difficult—Rumor That One of Them May be a Candidate for the Cup.

The traditional methods of steam vehicle construction have beep swept aside in designing the 1903 White touring car, shown herewith.

It bears not the slightest outward resemblance to the White car that has become so familiar during the last two years. Not a vestige of the horse drawn vehicle remains.

The shaftless carriage, as some one dubbed the average steam vehicle, has gone, and in its place is a car designed on the most approved European lines—a long, low car of massive construction, bonneted, artillery wheeled, tonneau bodied—in short, a car of the type that has commended itself by a sort of survival of the fittest evolution to Continental automobile makers as the best and highest form of the art.

The car does not come altogether as a surprise. It was known that the White people had something good up their sleeve, ready to be shaken down at the proper time—that period just before the show, when the automobile world is hungry for novelties.

It is fitted with a compound engine, generating 10 horsepower, and placed in front under the bonnet. The time tried semi-flash system of steam generating is, of course, employed, and water and gasolene tanks of ample capacity—holding fifteen and ten gallons, respectively—are carried, the use of the well known White condensers doing away with any necessity for frequent refilling of the former. The arrangement of the tanks and other impedimenta is so made, the bonnet in front especially conducing to this end, that there are no unsightly protuberances to mar the harmony of the lines or be in the way.

The strength and stability of the car are self-evident. It has a wheel base of 6 feet 8 inches, and a tread of 4 feet 8 inches, 30-inch artillery wheels and 4-inch tires. The extreme width of the car is 5 feet, the extreme height 5 feet 2 inches, and the weight, with tanks filled, 1,650 pounds.

The car is designed to seat four passengers comfortably, the tonneau body being of the roomy, high backed, finely upholstered type found on the best foreign cars.

The price of the touring car has been fixed at $2,000.

A peculiar significance attaches to the appearance of this new car at this time because of a rumor which comes from a very trustworthy source to the effect that the White concern is at work on a car that will be a candidate before the race committee of the Automobile Club for selection as a competitor for the Bennett Cup.

THE WINTON OF 1903

Best of the Famous Line of Cars—Its Many Features of Interest.

A bigger, better and more powerful car, a vast improvement over even the notable touring car of the present season, must be the verdict of any candid person who examines the new Winton production.

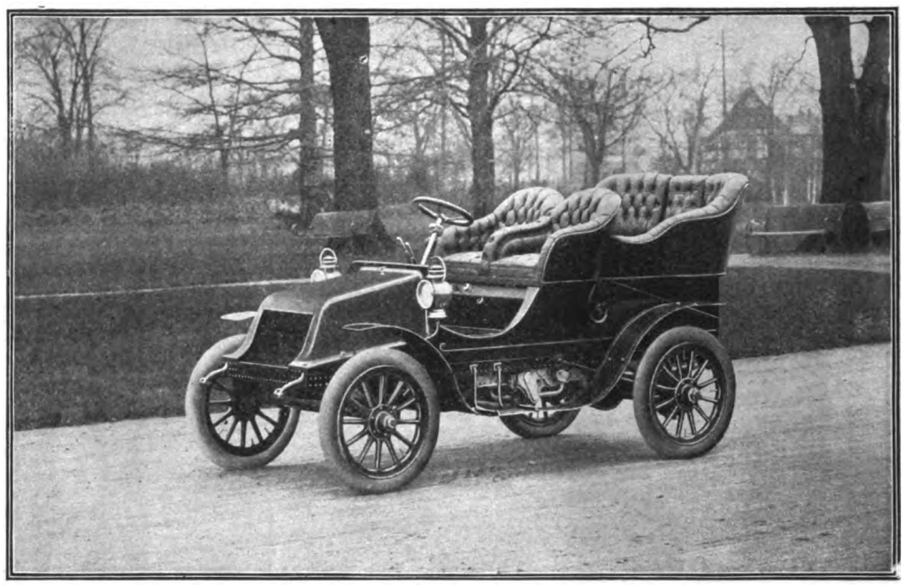
It has become an axiom with the connoisseur that an excellent racing car makes an equally excellent road car. It has proved no exception in the Winton case.

Last summer, when the Cleveland concern put forth the subsequently famous "Pup," it was known that that car was really the result of the skill and "know how" possessed by the Winton designers and workmen, exercised to produce a car that would be the fitting successor of the touring car then in the heydey of its successful career—in short, a new and improved touring car. The expectations thus formed of the car were not disappointed. It proved itself to be on the track what its builders hoped it would be; and the improving process continued and the car itself rounded into a perfected road vehicle, it is now presented to the public for its verdict.

Like the 1902 model, and yet strikingly different in some respects, the car impresses one at first sight as a marked step forward.

It is handsomer, roomier, better finished, more powerful than its predecessor—a more finished product in fact.

The motor develops 20 horsepower, instead of 15, as in the present car. It is the double opposed, water cooled, standard Winton type, with cylinders cast from the best grade of hard, gray iron, a superior metal for gas engine construction. The top and bottom covers of crank pit are cast aluminum, so alloyed as to combine lightness and present exceeding strength.



The cranks are secure within this housing, and as a consequence no oil from the motor will leak away and drip upon pavement or carriage house floors, nor is it possible for dust to work in and do injury to motor bearings. The crank case cover may be easily removed to permit a ready inspection of interior.

The connecting rods are of drop forged, open hearth steel, with phosphor bronze bushings, and the crank shaft is forged in one piece from open hearth steel, and is sufficiently heavy to withstand any service. The accurately proportioned crank shaft bearings are of phosphor bronze. Pistons are ground to size with micrometer gauges, and the boring of cylinders is accomplished in the same manner. Piston rings are cut before being turned to size, accomplished by the use of special fixtures, insuring an effective and even bearing throughout the entire circumference. The air pump connecting rod is well secured to a lug, cast solid within the forward motor piston.

With the transmission employed nearly all of the power generated is transmitted to the driving wheels. The transmission gears are contained within an oil tight and dust proof case. Steel gears operate against bronze, and the steel gears are cut from drop forged disks. The phosphor bearings are very carefully made and accurately proportioned. The differential gear is of the spur type, contained within an oil tight drum.

The driving chain represents a threefold increase in strength and durability. The sides and rollers are made of best cold rolled open hearth stock, the pins of nickel steel.

The new ignition system possesses many features of merit. It is simple and wonderfully efficient. Everything in the circuit is protected from electrical losses due to the presence of moisture and oil. The car is

equipped with two sets of batteries—one being held in reserve.

There is but one coil used and no vibrator to bother about. The contacts on the circuit breaker both move and are self-aligning and adjusting. The type of spring used in the breaker is such as to preclude possibility of breakage. Contacts are so constructed as to give positive results. They will free themselves of any foreign deposit which, if permitted to be present, would cause trouble. A heavy glass dial upon the breaker box makes it possible to observe the operation of contacts without removing box cover.

The transmission gears are incased and run in an oil bath. For the motor there is a reservoir beneath bonnet lid which is connected with the float distributing chamber by a brass tube. The float chamber is cast solid with crank pit cover. From the float chamber are feed pipes connecting with the several motor bearings, and the reservoir is so much higher than the float chamber that the gravity force makes a pump unnecessary. The float regulation insures an even feed of lubricant to the bearings. The differential gears are incased and packed with solid lubricant.

With a centrifugal circulating pump and an ample system of radiation a minimum amount of water is required. The water pump is driven by gear and its action is positive.

The steering gear is not rigid beyond the point of preventing shock upon the guide wheels being communicated to the steering wheel, or causing the car to deviate from its proper course. It is a development of the worm and segment principle. Steering joints are of the ball and socket type, adjusting themselves to all uneven road conditions. Steering post is of extra heavy gauge one and one-quarter inch steel tubing. Aside from the base bearing it has a strong support in the floor of car eight inches from the base. Steering wheel is heavy brass armed, with a mahogany finished laminated wood rim. Post is hinged near the top so that wheel may be swung forward to permit easy entrance to operator's seat.

The frame is of double angle and sheet steel securely riveted, with substantial cross braces. The strong iron box corner connections insure perfect rigidity to joints under all conditions of strain. The front axle is forged solid from one piece of best axle steel, and the steering heads contain phosphor bronze bushings, which give bearing to the pivot axles. The front wheels are equipped with double ball bearings. The rear axle is of the tubular tri-strut type, the live axle extending through from each rear wheel to the differential gear at the centre, where it is secured by means of a key and pin. The live axle revolves in parallel anti-friction roller bearings.

Semi-eliptic springs, both front and rear, are employed. Each spring is six inches longer than those in 1902 construction. They are also wider, much more elastic and so attached as to prevent shifting upon the axles. Tests with these springs have shown

Digitized by Google

them to be admirably adapted for the special service imposed. They are very powerful, and at the same time so elastic as to insure maximum comfort in riding.

A special wheel, of the artillery type, is used. The spokes and felloes are of best grade second growth hickory, and metal hubs are used. The steel clincher rim is shrunk upon the felloe, but as a means of additional security tire bolts are used at each felloe joint.

In addition to the emergency brake there are two others, one acting upon each drum cast solid with the rear wheel hubs. These hub band brakes are operated by a single lever convenient to the left foot. This lever works against a ratchet, which permits of brake being set to hold car, forward or back, on the steepest incline.

The muffler insures a silence in motor operation that is altogether pleasing. It is equipped with a relief slide for use on track when it is desirable to "cut out." This slide is controlled by hand from the operator's seat.

All lumber in the body is air seasoned and of first quality. The ash frame mounts panels of poplar. These soft and hard woods are mortised securely with glue and screws. All outside joints are carefully avoided. The bonnet, excepting the side panels, is made of sheet aluminum. Front seat is divided, the divisions being sufficiently wide to insure comfort.

The tonneau is especially roomy, and will comfortably seat three persons. Backs are very high, and the top of door is flush with the top line of the tonneau. A third seat fits in the door space when door is closed. The lines of both front and tonneau seats are especially graceful.

Merseles is Out.

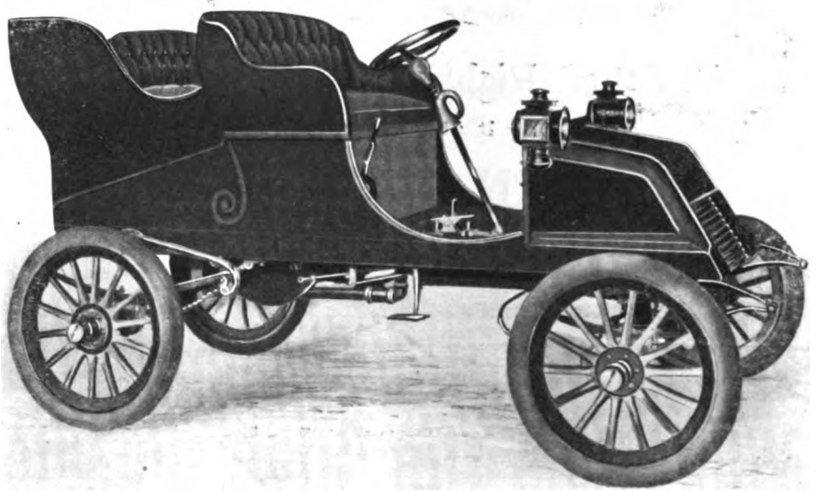
Theo. F. Merseles, vice-president of the International Motor Car Co., has resigned that office, the resignation taking effect today. He intends to devote himself to a wholly different line of business. Colonel Albert A. Pope is now president of the company, although A. E. Schaaf, the former head, continues in control of the factory at Toledo.

Date of N. A. A. M. Annual Meeting.

The annual dinner of the National Association of Automobile Manufacturers will be held on Friday night, January 23, at the Waldorf-Astoria. The annual meeting and election will be on Saturday forenoon, January 24, at Madison Square Garden.

Contraction in Canada.

Report has it that the Canada Cycle and Motor Co., of Toronto, is to absorb the Canadian Motors, Limited, also of that city. The latter named company does a considerable business in electric vehicles and storage batteries.



A local show for Indianapolis, Ind., is being talked of among the makers and dealers there. So far it has not got beyond the talking stage.

HERE'S THE GENERAL

Designed for the Man of Modest Means and Seems a Bargain at its Price.

From Cleveland, Ohio, that beehive of automobile industry, there came a short time ago another of that class of medium priced, pleasingly designed and well constructed gasolene cars that have done so much to make automobiling a popular pastime for people not millionaires, to wit, the General automobile, formerly known as the Cleveland, and the product of the General Automobile & Mfg. Co.

A roomy, comfortable, four passenger vehicle, the General car here illustrated, is propelled by a double cylinder horizontal

engine, with 4-inch bore and 4½-inch stroke, giving 8 horsepower. The cylinders are opposed, and so perfectly balanced there is practically no vibration. The transmission is direct for the high speed, with an adaptation of the sun and planet system for the slow speed. There are two speeds forward and one reverse, both of the former being controlled by one lever. On the slow speed the car will average a speed of from four to twelve miles an hour, and from fifteen to thirty on the high speed.

The steering is by wheel or side lever. The running gear is of the reachless pattern, with 72-inch wheel base and standard thread. Four 28-inch artillery wheels are fitted with 3-inch clincher tires, and are equipped with roller bearings.

The oiling is accomplished by use of a mechanical force feed lubricator, which gives the proper amount of oil at all times. All the gears are run in oil baths, and require no attention except an occasional renewal of oil. The power is transmitted by a roller chain to spur equalizing gear on the rear axle. The water is cooled by a radiator in front, and the circulation is secured by a Brown & Sharp force pump. The ignition is by jump spark and batteries. The weight of the carriage equipped with fenders, tools and all necessaries is approximately 1,100 pounds. The body is finished in seventeen coats of paint in either royal blue, automobile red, maroon or black. The trimmings are brass or nickel plated. The seats are upholstered in the best hand buffed leather in red or black, tufted or French style, to suit the purchaser. The price of the car is $900.

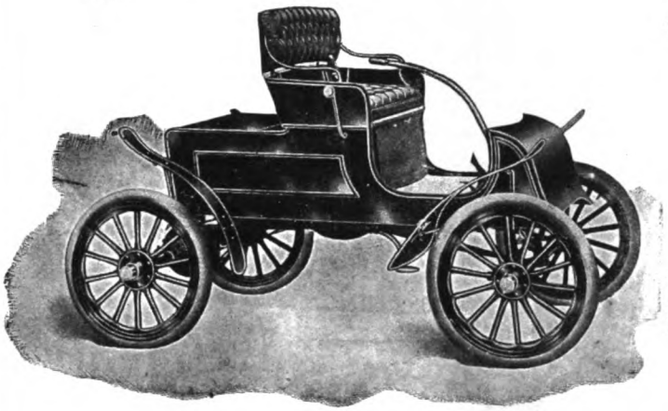
Electric Vehicle's new Depot.

The entire building at No. 134 to 138 West Thirty-ninth street, this city, will be occupied by the Electric Vehicle Co. as a New York branch as soon as the work of fitting up can be accomplished. It is expected that it will be ready by January 17, the opening day of the automobile show.

The building, which is just a few doors west of Broadway, has a frontage of 75 feet and a depth of 100 feet. It is an ideal building for the purpose, being one story in height, with immense windows and an imposing entrance. It will be handsomely fitted up, and a full stock of Columbia vehicles will be installed. There will be accommodations for nearly 100 of the latter.

Gasmobile Creditors get 10 Percent.

Creditors of the Automobile Club of America, Marion, N. J., will get a 10 per cent dividend as a sort of New Year's gift.



Vice-Chancellor Stevens signed an order on Monday allowing Henry C. Cryder, receiver of the company, to pay a dividend of 10 per cent to all creditors of the corporation. The report of the receiver up to date was offered for confirmation. It showed a total of $63,000 cash in hand.

Sherrerd Depue, counsel for some creditors, agreed to the dividend proposition, but he opposed the confirmation of the receiver's report. The court adjourned the latter phase of the matter for one week.

The gathering of chain makers in Cleveland, Ohio, as noted in these columns last week, did not take place for nothing. It was immediately followed by an advance in price.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y, Post Office, November, 1900.

NEW YORK, JANUARY 1, 1903.

The Year.

"If drunk with sight of power, we loose wild
tongues. . . .
Lest we forget, lest we forget."

It is one of the customs of conventionality that is wholesome to pause before tearing away the last sheet of the calendar and consider the retrospect.

The small boy on his birthday feels his muscle, squares his shoulders, stretches to his fullest height and revels in thoughts of how big and strong he is. He is proud to be able on and after that day to say, "I'm ten, going on 'leven," and his mind is aglow with fanciful pictures of the great things he will do when he is a man. How like is the birthday spirit of the small boy to that of a youthful industry, such time as it completes a calender year, and, vaunting its rapid growth, steps forward with new models in a confidence almost arrogant. The automobile industry of America is yet in its adolescence. It has grown remarkably fast, but it has not reached the adult plane. Like the growing boy, it is swollen with pride because of its growth, and is looking forward to sweeping conquests. Beyond this the comparison fails, for the youthful industry has some adult attributes of mind that the boy has not. It is not possible for the boy to rise in philosophy above his conceit and reflect upon how much bigger and stronger he might have been at the year's end if there lay behind him less of wasted opportunity. He cannot estimate the significance of his shortcomings and make the appreciation of them a profit to him in the future. The old head of the infant industry can do this.

During 1902 giant strides of progress have been made in automobile sport and manufacture in the United States. There is ample reason for the producers of motor cars and for those interested in the sport to be proud of what has been achieved. On the threshold of the new year the country stands a challenger in the competitive market of the world. American cars are being forced into the markets of foreign nations, and we are about to send three homemade cars to champion the country's claims in contesting against an open field for the trophy which is emblematic of international supremacy. Established manufacturers have greatly improved upon their products, and new makers have sprung up with newer designs, and we are on the eve of an exposition at which all the improvements will be shown and the progress made will be vividly presented.

During the last year there have been many performances in the line of sport also which are causes for just pride. On track and road the records for all classes of cars, except the heavy gasolene type, have been reduced, and, in view of certain track performances, it seems probable that lack of opportunity for road contests is the single thing that has prevented the straightaway record for heavy gasolene cars from being held by a vehicle of American make. Contests to demonstrate reliability have returned results not simply gratifying, but so excellent as to be surprising to all engaged.

Yet in the contemplation of all that has been accomplished, and of the radiant prospect, it is well not to "loose wild tongues" of boasting. It is better to reflect upon the advantages that were offered and wasted and to consider how much is still lacking and still to be achieved; better to recall how much more might have been made of the opportunities—"lest we forget."

American automobile manufacture began with its European preceptor offering it five years of practical experience as an example. It is the American way to overtake and outstrip its preceptors, but this has not yet been the case in automobile production. No doubt it will yet be done, for while we are slow in getting under way, we gather headway most rapidly, and take the lead going into the stretch. But what a waste there has been! If in humble spirit all the teachings of what Europe had learned had been accepted, how much greater progress there might have been. The domestic manufacturer has little more than just begun to be receptive of teaching. There is many a note in the trade that does not ring true.

Most of the faultiness of American product is due not to inability or lack of resource, but to traits that are temperamental. The American habit of mind is to approach a goal by bounds. The essential truth of the motto, "The more haste the less speed," has not been learned. Laboring feverishly with a plethora of ideas, the mechanic finishes imperfectly because of the impatience to follow out some new thought. There is such a thing as too much originality and too much faith in the soundness of one's own inventions. The national character is that of the workman who continually conceives some new idea while working out an old one and rushes his work, or even stops in it, in order to try the new. So it is too often the case that American workmanship lacks completeness, thoroughness and finish. No man executes one idea to the fulness of its possibilities if another is being entertained and developed while working on the one. Such is the mental habit that begets fickleness and slouch work. American automobiles show some evidence of the trait. Novelty and variety are in greater proportion than substantiality. More sincerity, more patience, more faithful and receptive plodding will be better than more ambition, more novelty and more haste. Our machines show this, and the history of the industry shows it. It would have been better if we had earlier learned to take what had been done by foreign makers as a model, not in servile imitation, but in the proper spirit of tyros. Building upon the experience of others, rapid improvement would have been inevitable, and they would have had a secure foundation. The scrap heap of our early attempts at originality is a big one. This is a lesson of the past.

It is not the time for bombast when a re-

Digitized by Google

trospect shows as much of failure as success. Even though success is often built on failure, it is hardly the material to select for foundation when choice is offered. Much of the failure in motor vehicle construction can be traced to a wilful and headstrong attempt to depart from proven principles in order to experiment with self-conceived theories. If the number of manufacturers has largely increased during the last year, there is a record of almost as many who have experimented mechanically and commercially to the end of their resources and then dropped from sight. If there are a greater number of exhibitors at the coming show than ever there was, who is there to doubt but what several of them will be missing in 1904? Enough new ones will spring up to more than replace them, but all goes to show that we are not yet through with frivolity and waste. If there have been new records made, more than one of them has been made with vehicles not suitable for mercantile offering, and the building of which did not aid in practical constructional progress. If there have been reliability contests which yielded highly praised results, it is well to remember that the tests were but child's play as compared with runs that in Europe are accepted as commonplace. If the social elements of the sport have been well organized into clubs, and the regulation of racing begun, there is still much to be desired in the spirit of the organizations, in the concentration of their efforts for good roads, and in the races, rules and methods of their administration. If the manufacturers have been organized into a protective and aggressive body, there is still very much to be desired in the harmonious, progressive and effective conduct of its affairs.

All this in the retrospect can be reflected upon without inducing a spirit of pessimism, and it is not mentioned with any such spirit. It is well not to forget in order to correct, yet there has been genuine and commendable progress, and the outlook is clear for a Happy New Year.

In many respects the last year differed markedly from its predecessors. It was distinctly a year of progress, and, to a lesser extent, of prosperity for the industry as a whole. Experimenting was not entirely foregone. But it played a smaller part than heretofore. Most makers knew at last what was best or, pretty nearly the same thing, what was wanted by the purchasing public. Consequently they set themselves to produce it.

A resume of the exhibits of makers at the three New York automobile shows—two already held and the third scheduled for this month—will illustrate this point.

At the first show, that of November, 1900, twenty-eight makers exhibited, eight of whom had withdrawn from the field—whether by failure, absorption or otherwise—within a year. In 1902 there were thirty-six makers showing, only five of whom have given up the ghost since, and most of them were in distress at the time of the show. For the forthcoming show fifty-six makers have taken space, no less than sixteen of them having come into being within the year. Of these, how many will have survived when the roll is called twelve months hence? Time alone can answer. But assuredly some of them will fall by the wayside.

This unusual stability was unquestionably due largely to the success—pronounced or moderate—that attended the efforts to produce the sort of cars that was wanted. The demand has crystallized into two widely opposing and differing tendencies—the one a runabout type, cheap, simple and easily handled; the other designed on European lines, imposing in whatever aspect viewed, a veritable road locomotive, powerful, speedy and costly.

To say that there is no room for anything between these two types would be going much too far and fast. There is considerable between, and probably will continue to be. But that does not detract from the accuracy of the statement made. The lines of demarcation have been drawn, and sides are rapidly being taken. Runabouts at less than $1,000, touring cars at $2,000 and upward—these are the chief lines of development, and along them much the greater portion of the industry will be found working during the next few years.

These tendencies are radically opposed in every way. One represents the European way, the other what seems destined to go down in history as th American method. The former is extolled to the skies, claimed to be the only defendable way, progressive, logical, inevitable. The latter is defended feebly and perfunctorily, acknowledged to be out of "fashion"—and yet persisted in, and, if anything, growing in popularity.

The truth of the matter is that there is reason for the existence of both types. Each has its advantages and disadvantages, its advocates and opponents. This is proved conclusively by the fact that each year the types get further apart. The features complained of in both are more and more emphasized, their simplicity or complexity, respectively, for example, resolved into something still more simple or complex than it was before. In this makers and users are only logical. If a certain thing is good more of it would be better, and this more is forthwith added. Consequently the gulf widens perceptibly.

If the past year witnessed the initial steps in the direction of adopting European designs and methods, it also saw the practical culmination of its opposite movement embodied in the runabout type of car.

Two years ago such cars were underpowered and frequently underweighted; wheel bases were too short, and in reliability, stability and simplicity there was much to be desired. At the 1901 show much of this was changed, and during the last season the alterations made were given a working trial and were abundantly justified by the event. At this time comparatively few shortcomings are properly chargeable against them, so great has been the improvement.

Changes that mark epochs are sometimes made with great rapidity. One short year ago there were not wanting observers to predict that the decline and fall of the steam car had set in. To-day it is pretty thoroughly rehabilitated and strong in popular favor. Mismanagement and mistakes gave it a bad name; new methods and new cars have reversed the situation.

In electric vehicles there was no lost ground to recover, and the progress has been steady. Battery efficiency plays the most important part still, and while the great strides noted at the end of 1901 have not been duplicated, there has been undoubted improvement.

During the last year we have been honored with a most unusual share of the public attention—a publicity that carried with it penalties as well as privileges. All eyes were on the automobile, or so it seemed, and the iron hand of the law was also felt all too frequently.

Nothing could exceed the severity of the treatment accorded automobilists at the hands of a portion of the public. Provoked by the actions of a few inconsiderate and reckless users, an outcry, violent and long sustained, was raised, starting with the yellow journals and participated in by others that are not usually classed as saffron. For

Digitized by Google

a time it seemed as if every man's hand was against the new road vehicle. A flood of legislation, municipal and State, followed, and was accompanied by petty persecution, notably in Long Island, Yonkers and other places.

Like all such ebellutions, this one partly burned out in a comparatively short time, spending itself largely by its own violence. The automobile ceased to be a nine days' wonder, and there came a lull, let us hope a long one, in the tide of legislation. While there is still much of a harassing nature ahead of the automobile, it is reasonably certain that it will in future be permitted to take its place in the world's political economy as a useful part thereof.

A year ago the exportation of American made automobiles had not much more than begun. A few concerns had opened up foreign connections, and were just beginning to perceive the possibilities of the trade.

Since then an advance all along the line has been made. An established and steadily increasing trade has been built up in European and other countries. Shipments are made almost daily, and the volume of business for the year bids fair to approach the million-dollar mark. Steam and electric vehicles have so far been the chief beneficiaries, although American gasolene cars have also made a good name for themselves in some quarters.

A notable change has come over the tire situation. Where ae year ago the detachable type was in a decided minority, it has advanced by leaps and bounds, until it now falls but little short of dominating the trade.

Whether or not this popularity is destined to be permanent it is not easy to say. By some it is regarded as but one more step in the direction of recognizing the leadership of Europe, where detachable tires have always been almost universal. A more probable explanation is the desire to find a better tire than was obtainable, a desire seemingly gratified by the adoption of one radically different.

However this may be, detachable tires form the equipment now most favored and most seen. A year hence we shall be able to forecast their future more accurately than now.

For the departed twelvemonth a better showing in the way of speed trials, hill climbing, reliability and other tests is afforded than for any previous year.

The main interest, of course, centres in the one-mile and one-kilometre straightaway record, and those do not belong to America. It was August, 1902, before the record of 0:51 4-5 for the mile, made by Fournier on the Coney Island Boulevard in the fall of 1901, was shaded. It was W. K. Vanderbilt, jr., who made the first cut in the record. He carried it to 48 2-5 seconds, and made the kilometre in 29 2-5 seconds. Fournier lowered the figures in November to 47 2-5 seconds, and a few days later "Angieres" made it 46 seconds flat. The kilometre record of 29 seconds has been made by both "Angieres" and Fournier.

On this side of the Atlantic glory enough for a new industry has been gained. In May the Automobile Club of America promoted a "non-stop" contest of 100 miles to Bridgeport and back that was the first truly successful endurance competition held. The result was one that testified to a higher degree of efficiency and reliability in domestic machines than had been supposed. Of the fifty-three starters forty-four covered the entire course and twenty-eight got certificates. This affair showed also a very low percentage of gasolene consumption.

On May 31, the day after the reliability run, came the only speed trials that were held on the road during the year, the sad accident that terminated them preventing any further attempts for road records. Although these trials were interrupted and not completed, the Baker electric vehicle that ran amuck made the record of 36 1-5 seconds for a kilometre, while S. T. Davis made a record for a steam carriage of 1:12 for the mile and a record of 46 1-5 seconds for the kilometre.

Through August, September and October new world's track records were repeatedly made by various classes of motor cars, and, although the straightaway figures for the mile and kilometre do belong to France practically all others were made in the United States. The mile in 1:02, made by Alex Winton, and the unaccepted record of a mile in 1:01 1-5, made by Oldfield, warrant the belief that either of these men might be dangerous to the French road records if they could but try for them.

The finest showing for the American made automobile came in October, when sixty-eight of the seventy-five cars that started on the reliability run from New York to Boston and return completed the trip, of which number sixty-five earned first class certificates and seventeen scored a clean bill of health and were equal claimants for the Shattuck Cup.

All of this is history that warrants an increased confidence in the home product, and justifies a reaching out after greater things. The American machine is ready for severer tests on the road and on the track than it has had. Very soon it will have one in competition with the best products of the world. Until the cars that will compete for the Bennett Cup are made known it is impossible to form any opinion on what will be their chances to make a creditable showing or possibly to win.

Variety is truly the spice of life, and no one knows it better than the autoist. To have too much freedom from accident—or incident, which is frequently the same thing—is only a degree less exasperating than to enjoy (?) too much trouble. What is really wanted is the happy medium—enough incident to give spice to existence, enough successful effort at putting wrongs to rights, to leaven the monotony of life. And, it may be added, the autoist usually gets this fillip.

No repairs or adjustments, except while running, is to be one of the requirements of the 1903 British trials. That is to say, all time spent on the cars will be deducted from the running time. The rule is severe but fair, for the car that somes through without repairs is undoubtedly entitled to more credit than one that has to be tinkered with. Such a rule brings this fact out.

Reports of mysterious cars being built in secret to compete in the Bennett Cup race, one being fathered by H. S. Harkness and another of anonymous origin, smack strongly of America Cup preparatory methods. The yachtsmen of the land appear to like the ways of the devotees of Neptune.

An English autoist was arrested and fined recently for driving his car at the rate of ninety-seven miles an hour. The A. C. of G. B. should see that he is put on the Bennett Cup team.

Some owners have such bad luck that not only automobiling, but life itself, seems like one grand confidence game to them.

Snow several feet deep is not sufficient to feaze a well behaved car.

French Bureau Motor World.
2 Rue d'Abbeville.

Paris, Dec. 15.—As the automobile industry is accurately reflected in the annual show organized by the Automobile Club of France so the growing importance of the motor vehicle is to be judged by the increasing number of carriages exhibited, the larger space devoted to the display of vehicles, and the remarkable interest taken by the public in this annual exposition.

At each of the previous shows the industry seemed to have about reached high water mark so far as it proved the popular success of the automobile, but on the present occasion, at least, all previous manifestations of the kind have been eclipsed, and in the light of past experience it is by no means certain that the Paris shows have even yet arrived at the limit of their success as one of the great spectacular events of the year. Nothing, indeed, is more remarkable than the way in which the automobile has taken a hold upon the affections of the French public. It is easy to understand that they should be attracted to shows and expositions of all kinds which appeal in their artistic sentiment, and offer something which pleases their taste and are looked upon as a convenient rendezvous of the pleasure seeking classes, but with all due respect to the automobile it is difficult to associate it in any way with the highest forms of art, though as we shall show art has taken a pretty big place in the Salon de l'Automobile, and if the public flock to the Grand Palais in their thousands it is solely because they take an interest in the vehicles themselves. The Frenchman is, in fact, proud of the standing which the motor vehicle occupies in his country. He regards himself as the inventor of the automobile, and having originated and developed mechanical road locomotion, he believes it to be the duty of France to keep well to the fore and maintain the supremacy which nevertheless it does not seem in danger at the moment of losing. The construction of motor cars is the one branch of the engineering trades which is really flourishing in France, and it is a patriotic duty to support the industry and show the world that this country is successfully tackling the various problems which are to change the whole aspect of road locomotion.

BENZ.

The number of exhibitors is far more considerable than was the case last year, and the organizing committee have had the greatest difficulty in finding room for them all. Every available inch of space has been taken up in the main hall, a vast glass covered building upward of two hundred yards in length, and all around the two circular galleries the exhibitors are cramped for space, and they fill up the annexes with stands of motor cycles, tires and accessories, and down in the basement there is a big exhibit of alcohol motors, and alcohol as a heating and lighting agent has also taken possession of the rear hall. Contrary to the usual experience with shows of this kind, the appearance of the main hall is extremely picturesque with the great variety of artistic signs, for the committee have wisely decided to encourage the artistic taste of exhibitors by offering special prizes for the best arranged stands, with the result that the artist and decorator have done marvels in the way of providing beautiful settings for the automobiles. Clement, for instance, has a sign painted in relief representing various automobile scenes, and De Dion et Bouton have called in the aid of the "new art" with graceful sculptured signs, and others have relied mainly upon the skilful arrangement of plush drapery. This feature of the show is well worth the attention of foreign makers who will find that one of the secrets of successful exhibiting is to make their stands as attractive as possible, for though the man who goes to buy vehicles may not be influenced by the way in which the cars are staged an artistic show is a very important factor in drawing the public, among whom are a large number of prospective buyers who only need convinc-

ing to take a practical interest in the automobile.

Another thing that may be mentioned as proving the increasing vitality of the motor vehicle is the considerable number of cars arranged outside the Grand Palais. These made a show of themselves. Most of them belonged to private owners who were visiting the Grand Palais, and others were duplicates of the vehicles shown inside and were intended for trial purposes. Manufacturers are no longer content with merely explaining the mechanism of their cars. They are anxious for the public to try them, and the prospective buyer has now an opportunity of going direct from the stand to the car outside, instead of being required to go away somewhere out in the suburbs to the works, when he will more often than not intentionally forget all about the appointment.

Again the show was formally inaugurated Wednesday by the President of the Republic. M. Loubet has certainly visited the previous expositions, but he has never been there to inaugurate, and, in fact, none of the shows in Paris have ever been able to secure such a high distinction as to be officially inaugurated by the President. The event is therefore one of the greatest importance as showing that the Salon de l'Automobile is regarded by Paris society as something more than a social function. The French aristocracy and the wealthy classes have, in fact, built up the automobile trade, and they are proud of the part they are playing in the development of the industry.

In our preliminary article on the Show we covered most of the new features in motor vehicle construction, and, in fact, what we said then can only be repeated now as giving a general idea of the constructional improvements in the carriages exhibited. The steel frames, motors with mechanical induction valves, and carburetters we have already described, and with the combination of the mechanical valve and the new carburetter we have got a car which is as silent as the most exacting user would wish. The mechanical valve and throttled carburetter are of course copied from the Mercedes, and it is a curious fact that even in external appearance the new carriages have a close resemblance to the Mercedes pattern. Patriotic Frenchmen deplore this tendency to copy the German machine, and copied, too, with almost slavish imitation, since it seems to show that the Gauls are no longer able to rely entirely upon their own ingenuity and are taking ideas from a country which has never shone brilliantly in the automobile industry, and, apart from the Mercedes, has never produced a satisfactory pleasure carriage. The influence of the Mercedes is real and far-reaching, and is undoubtedly an excellent one except that it appears to keep the mechanical design of cars too much in one groove. Whether this influence will be permanent it is impossible to say, though it is to be feared that the French makers will be a long time breaking away from it, especially in view of the fact that the Cannstatt people are still keeping ahead, and will be producing in 1903 certain improvements which may once more put them in front of the French cars. At the same time it must not be overlooked that the Mercedes have been copied in the essential features which conduce to silent running, and having almost entirely suppressed the noise of their motors they have got to a point when they may give more attention to other parts of the mechanism, such as increasing the efficiency of the transmission gear

FIAT.

BELGICA 35 H. P. LIMOUSINE.

The French have indeed already begun to successfully tackle a problem which is almost, if not quite, of as much importance as the suppression of noise. This is the invention of the "compensating carburetter." The difficulty with motors so far has been in regulating the gas mixture, which has always had to be done by hand, and even the most skilful driver is unable to do this satisfactorily. With the new Krebs carburetter, of which we gave a description in the last show article, the proportion of gas and air is regulated by the motor itself, and an engine running in the alcohol section

Digitized by Google

works with remarkable regularity and with scarcely any noise at all. By using the ordinary types of carburetters the quality of the mixture is constantly varying with the difference in the running of the engine, and as the motor slows down the proportion of air increases, with the result that the gas becomes so poor that the motor stops. With the compensating carburetter the mixture is always the same, so that the impact on the pistons is the same, and some makers employ carburetters in which the richness of the gas is increased with the slowing down of the engine, though whether there is any advantage in using a mixture with a higher proportion of gasolene is open to question. The improvements in carburetters and the mechanical valves are thus tending toward the design of motors of greater elasticity, and this is one of the features of the Paris Show.

In dealing with the stands we will describe first of all the novel features on the well known types of cars. The Mors people have entirely changed the design of their engines, which are now cast with the valve chambers on each side, and the inlet valves are operated mechanically by means of half time shafts driven from the engine shaft with fibre spur wheels. They are still employing the magneto, but are adopting a new mechanical device for advancing and retarding ignition. The system of radiator has also been changed, and the one adopted is on the Mercedes principle, with small elongated cells forming thin walls of water, and an air circulation is induced by a fan behind. The lubricating oil is fed under pressure of the warm water from the motor before it returns to the tank, this system being used to prevent the oil from getting thick in cold weather. The employment of the radiator tank has also changed the appearance of the motor bonnet, which is now long and straight, as is the case on nearly all the cars employing this type of radiator. The crank chamber is carried on arms which are bolted to the main members of the steel frame, which is of the section introduced by the Mercedes and now being very largely adopted by the French makers. While it may be doubted whether there is really any advantage over the armoured wood frame from the point of view of lightness and strength, unless the metal used is of special selection, the construction of the steel frame is certainly cheaper, and makers evidently believe in the superiority of the steel frame, since they are building it to a greater length and in this way are allowing it to be fitted with larger and more roomy carriage bodies.

In the carriages of Charron, Girardot et Voigt we again see the steel frame of the usual section, with the motor bolted to the side members. As the result of their experience with the racing cars which were fitted with steel cylinder engines, the firm intend in the coming year to build all their motors with steel cylinders, and the cast motor will be abandoned altogether. And here we must rectify a statement we have made in previous letters to the effect that the steel cylinder motor is more expensive to produce. According to certain makers this is not the case, and if some steel cylinders are more expensive it can only be in the cost of the material employed, as some manufacturers give more homogeneity to the metal by submitting it to a hammering process or to hydraulic pressure. The sole advantages claimed for the steel cylinder are lightness and the absence of blowholes. The new C. G. V. engines have mechanically operated inlet valves, the valves being on each side of the cylinders, and every part of the engine can be got at independently. The firm have their usual transmission gear, modified to give direct drive on the top speed, as is now usual in most of the vehicles. Besides their standard types of two and four cylinder motors the C. G. V. concern exhibit a frame with an incomplete eight cylinder engine of forty horse power, with the cranks set at 45 degrees. This is an entirely new departure in automobile construction, and it is intended to do away with the change speed gearing altogether, since the makers claim that with the facility for running at any speed from 200 revolutions up to 1,600 the eight cylinder engine will allow of the car being driven at any rate without the intervention of gearing of any kind, the speed of course being varied by simply advancing and retarding ignition. As the new vehicle has not yet been terminated, the claims of the makers can hardly be accepted without reservation until the car has been put to the test. The firm also exhibit a new war automobile in the shape of an ordinary tonneau armored with steel plate and carrying a Hotchkiss gun. This is not the type of vehicle required for war purposes, as the motor and tanks and every vital part need quite as much protection as the man behind the gun, who, however, gets very little. With the concentrated fire employed in Continental tactics an automobile would have little chance within range unless it were armored all over.

The features of the C. G. V. cars are to be met with on most of the other vehicles at the show, with the exception of the steel cylinders, which are still confined to a few firms. Whether the steel cylinder will become general it is difficult yet to say, for the French manufacturers are not usually ready to jump upon a new idea unless it is a proved success, and it is by no means certain that the steel motor has any advantage beyond lightness and freedom from blowholes. The C. G. V. firm are the only people who have decided on building all their engines upon this system, the other makers preferring to leave the steel cylinders for the big engines of 50 and 60 horse-power and employ castings for smaller motors.

As we have said, the similarity of design observable in the vehicles is largely due to the influence of the Mercedes, and even the firms who have always taken the lead with new improvements are adopting the features of the German vehicle. On the Mors stand, for instance, we see the U section frame pressed out of steel plate, and the engines have mechanically operated inlet valves. The only change in this vehicle from the usual practice is the method of advancing and retarding ignition with the magneto, which is done by a special form of cam, and the carburetter has also been modified so as to secure a constant quality of gas mixture, a condition which is very necessary in engines designed to run at a very low speed. The usual method is to govern the carburetter by the engine so that the air ports are opened or closed by the action of the governor, but in the Mors the gas is always kept in proper proportion in the mixing chamber, and the quantity only is varied by ports over the induction valve. Of course, the quality of the mixture can be regulated by hand, if required. There is no change in the type of transmission which was adopted for the first time on the Paris-Vienna vehicles, and is now used on all the firm's vehicles. The outward appearance of the Mors cars has been entirely modified by the use of the tank radiator, which fits in the end of the motor bonnet, so that it is not rounded off, as formerly, but is straight, with the top forming half of an octagonal section. This gives a much neater look to the vehicles, and, in fact, the radiator tank has done much to improve the appearance of the automobile all around.

In the way of novelty it cannot be said that the show has anything particularly striking, for when makers begin to copy standard systems they do not find much scope for the display of their own ingenuity, and, moreover, the failure of so many new

NAPIER.

Digitized by Google

and ingenious systems in the past has made inventors chary about bringing out new mechanisms unless they are designed upon thorough mechanical principles. The "crank" is beginning to lose ground in the annual shows, and as the automobile passes the experimental stage, and manufacturers see that they have everything to gain in following the best practice, they are not inclined to trouble themselves with any startling innovations, which, however ingenious they may be, are not likely to have much success in a road vehicle which calls for the greatest possible simplicity and the suppression of everything that may result in unnecessary loss of power between the engine and the driving wheels.

Still, on many of the stands there are a good many interesting new devices, and some of these are to be found in the Decauville cars, the mechanism of which has undergone a complete change the last few months. Like all the other leading firms, the steel frame carries a four-cylinder vertical engine, with mechanically operated inlet valves, and a special feature is the casting of the crank chamber and gear case in one piece, the two being connected by a sort of well for the fly wheel. An advantage of this arrangement is in getting a perfect alignment of all the bearings. Another point in the Decauville cars is the method of applying the power to the rear wheels. The universal jointed shaft is employed, but instead of motion being given to the rear axle, it is carried through the tubular axle to the hubs of the wheels. The axle is formed of two tubes forming extensions of the differentiad box, and inside run two shafts, each having a square end to fit into the differential, and the other end has projections fitting into the outside of the hub, over which is screwed a cap to keep the shaft in position. This is an entirely new method of power transmission and it will be interesting to see how it works. The idea, of course, is to take any thrust off the axle, which, in the case of shaft transmissions, is very considerable.

Panhard et Levassor have evidently not thought it desirable to follow the general practice of building their frames with steel, for they are still using armored wood and the transmission gear has not undergone any change, but there are several interesting improvements in the motors. They are exhibiting two types of engines, a four cylinder vertical engine of 60 horse power and a three-cylinder motor of 8 horse power, the latter being of a type introduced by several makers who aim at getting over the noisy action of the two-cylinder motor by setting the cranks at 120°. Any one who has used a four-cylinder motor will never return to the two cylinder, and by effecting a compromise it looks as if makers were getting the same sweetness of running with the three-cylinder engine. It is probable that the system will become very popular in the future for light carriages. On these smaller engines the induction valves are automatic, but the results obtained with the Krebs carburetter in the way of slowing down are startling. In the alcohol section there is a big four-cylinder with automatic valves, coupled to a dynamo, and it is slowed down to 200 revolutions with the greatest facility, while even when running at high speed the noise is extremely small. The carburetter is doing something wonderful in the way of improving the gasoline motor, and what with the mechanical valves and carburretter a big advance is being made in the production of motors giving a high elasticity of power. On this car another feature is the steering wheel control, consisting of a cross piece fitted to the wheel and forming three parts, so that the throttling and ignition are controlled by pulling away one or another of the tubes from the central toothed ring, and on turning them as required, letting them slip back to be fixed by the teeth. On the big car the four-cylinder engine with steel cylinders is carried on a couple of steel bars passing through the crank chamber and fixed to the side members of the frame. The accumulators are charged by a small dynamo from the fly wheel, as is the case in the Decauville and other types of vehicles. The radiator tank is also employed, with rectangular air chambers on the Mercedes pattern. The firm exhibit some very fine finished cars in the form of the coach, limousine and French cab.

The Georges Richard vehicles have been entirely remodeled since the last show. This firm formerly made a feature of voiturettes, in which they used small air cooled engines and belt transmissions, but when the business came under the management of Brasier, the late engineer of Mors, the whole mechanism was changed and the firm have been giving their attention specially to big cars. These are propelled by four and two-cylinder motors, the larger ones developing 40 horse power. The makers have very closely followed the Mors pattern of transmission gear with direct drive on the top speed, though in certain respects it has been simplified. Clement et Cie make an excellent display of light carriages with motors of one, two and four cylinders, and they are designed with either automatic or mechanical inlet valves, the valves in the latter case being on the same side and operated by the cam shaft. The carburetter is regulated by the governor. It has magneto ignition, which, by the way, is very prominent at the show, and this system seems likely to very largely replace the battery in the future. There are several new features in the Clement cars, notably the expanding clutch forming sectors which are expanded inside the female cone, which has the advantage of preventing any slipping action of the clutch and at the same time allows of its being applied progressively. The expanding clutch is to be seen on the C. G. V., the Pascal, Berliet and several other vehicles.

An international flavor is given to the show by the presence of a number of cars of foreign origin. From England comes the Napier and Wolseley; from Germany the reconstructed Benz and the Mercedes—the latter being confined to 1902 patterns shown by a local agent; Belgium sends the Belgica; Italy the Fiat, and America was represented by a lone steam car, which is not wholly honored in its own country.

Following their usual custom, the Serpollet Company contributes a freak racing car, "Le Torpilleur." It resembles an inverted coffin as much as anything else; it has a section scooped out of the center, into which the operator sits and directs the progress of the car. The chassis is long and low and the body overhangs the rear wheels by several feet.

GUESSING THE GRADIENTS

Hills, Like Speed, are not Always What They Seem, as Witness These Examples.

As not one man in five can determine with any degree of accuracy the speed at which an autoist is travelling, so very few of the latter have anything but hazy ideas of the gradients of the hills they climb.

That a 30 or 40 per cent grade has been ridden is often claimed—and really believed. They do not stop to think, or to figure the matter out and see how absurd such claims really are. A 25 per cent grade—an ascent of 1 foot in 4—is about as stiff a grade as an automobile can climb, and then only if the roadbed is good. Thirty and 40 per cent grades are utterly out of the question.

Nor is it motor cars alone that would meet with failure on such excessive rises. No horse drawn vehicles could surmount them. No road builders would be so stupid as to include such gradients in their plans, knowing, as they do, that they would be entirely impracticable.

Ordinarily roads seldom reach a gradient of 20 per cent; the exceptions being in mountainous regions, and even then it is doubtful if 30 per cent is ever exceeded for more than a few feet. The notorious Nelson Hill, near Peekskill, N. Y, did not reach 20 per cent at its steepest point, yet for miles around it was looked upon as a formidable "pimple," and one likely to cause many automobiles to come to grief—as it did in the 1901 endurance run. Since then, so excessive was the grade considered, a new road has been built around it.

On the Boston run last October the steepest hill encountered in either direction did not reach 20 per cent. Eagle Rock hill in the Oranges does not reach this figure, either. It would probably be difficult to find a hill, unless in remote districts, that is as steep as 30 per cent.

It will be found, too, that ordinary grades, such as the autoist encounters on the average road, seldom exceed 10 or 12 per cent. A grade of half this much would sometimes be accounted "a pretty good hill."

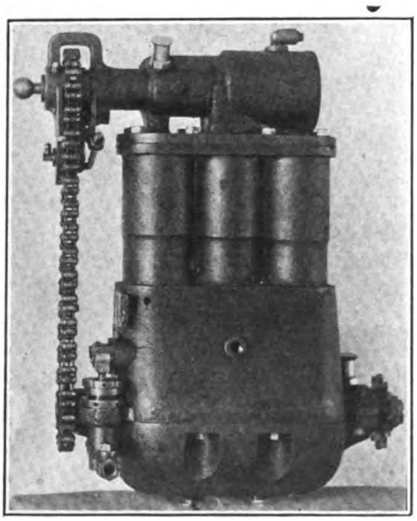
Baltimore Park Officials Defy Law.

Baltimore autoists and park commissioners are at loggerheads again. In defiance of the State law, which was passed with this very matter in mind, the commissioners have a rule which forbids the use of Druid Hill Park to automobilists. The rule bars heavy vehicles and others not drawn by horses.

A short time ago William Keyser, jr., president of the Automobile Club of Baltimore, invaded the sacred precincts for the purpose of making a test case, and was promptly arrested. The magistrate before whom he was brought as promptly discharged him, citing the act of the legislature.

Asked for an expression of opinion, President Clendinen of the Park Board, who is one of the most prominent of the autophobes, said:

"I am very much occupied with my private business, and I have no statement to make concerning the matter."



Carter's Runabout.

A good looking steam runabout is that made by the Carter Automobile Company, Jackson, Mich., and shown herewith. The vehicle is equipped with a three cylinder engine possessing some novel features. A rotary valve constructed on the same pdinci-

ple as the slide valve is used, which will keep seated at all times; wear will not affect the valve in any degree. There are no stuffing boxes.

The body is hung very low, a construction made possible by the fact that the shaft runs through the engine with driving sprocket on the side instead of through the centre. By so placing it the chain

passes alongside the boiler instead of under the firebox.

The carriage has a low water alarm as well as a gauge glass and try cocks, a steam air pump and a 11-16 inch bore to boiler. The feed pump has two six gallon tanks of gasolene, with separate cut outs, which sets under front hood, or seat.

COLD WEATHER CARE

Small Attentions That Will Save Large Repair Bills and Much Vexation.

One would think that any autoist who had the slightest regard for the value of his car would take some simple precautions to render sudden cold snaps harmless. To put a car away for a night, or nights, in a place but little sheltered, without drawing the water from the tanks, the pipes and the water jacket is to invite an accident. A drop in the temperature is all that is necessary to precipitate it.

The winter has scarcely well set in, yet there have been a number of cases reported in which cracked cylinders and burst pipes figure. The cars to which they belonged had been left open to the attack of the frost king just once too often; and the penalty had been paid.

With water jacketed engines the best plan is, of course, to use a non-freezing substance. If this is not done not even the most assiduous care and attention will avail to keep off Nemesis in the shape of a congealment of the liquid that is almost certain to bring havoc in its train. Circulation may be relied on to prevent this to a certain extent; but if a stop of any length is made freezing is likely to occur, while in extremely low temperatures this may take place even while the car is running.

Many owners prefer, of course, to go through the winter without using a non-freezing mixture, arguing that for the limited use they make of a car it is not worth going to the bother and expense.

On the comparatively few occasions when the car is levied on a very little attention given to the drawing off of the water will prevent any trouble of the kind apprehended. But pains must be taken to see that the draining of the pipes, tanks, etc., is done thoroughly, for a few drops of water left behind will do almost as much damage as a large quantity. A burst is a burst, and it will sometimes cost just as much to repair the ravages of one caused by imperfect draining of the water receptacles as one due to the neglect to take any precautions whatever.

As long as a car is kept in commission through the winter it ought to be looked after properly; and there can be but one way of thinking about the matter of freezing, i. e., that an ounce of prevention is worth a pound of cure.

Olds Helps the Postmaster.

To relieve the congestion caused by the accumulation of Christmas mail at Detroit the Olds Motor Works placed three automobiles at the disposal of the postmaster, and they were put to good service in making deliveries.

PHILADELPHIA'S REQUIREMENTS

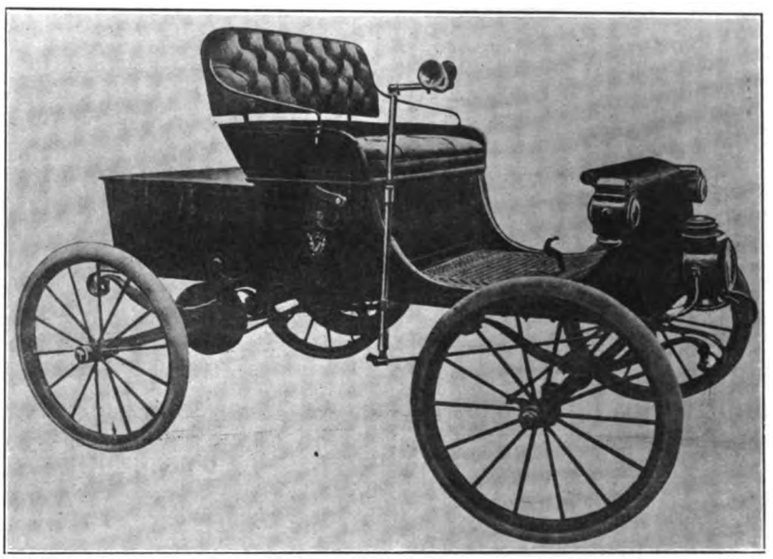
The Quakers Reduce Speed and Define What Manner of Car Shall be Used on Their Streets.

By accepting the amendments proposed by the Common Council the Philadelphia Select Council last week advanced the vehicle traffic ordinance calling for a maximum speed of seven miles an hour one more stage. It now requires only the Mayor's signature to become a law, and that is confidently expected.

The ordinance passed provided that "no person, driver or operator in charge of any automobile or motor vehicle, or carriage described as above, shall drive, operate, move or permit the same to be driven, operated or moved on, over and upon any public street, alley, highway, road or driveway in the built up portion of the city of Philadelphia at a rate of speed greater than seven (7) miles per hour, and within all other parts of the city of Philadelphia at a rate of speed greater than eight (8) miles per hour."

In the original measure the rate of speed beyond Vine, South and Sixteenth streets was eight miles, and beyond Erie avenue, Porter and Fifty-second street, first a speed of fifteen, then of ten miles, was permitted.

In addition to the regulation regarding speed, the ordinance contains many provisions calculated to render the lot of an automobilist an unhappy one. The Bureau of Boiler Inspection is given control of automobiles, and to it they must be submitted for examination. Licenses and numbers will be issued by this bureau upon the payment of the required fees.



Before being passed by the bureau these stipulations must be fulfilled by the various vehicles:

The reservoirs, tubes and whatever parts employed for the holding of explosive or inflammable products shall be so constructed as not to allow the escape or falling out of any material which could cause an explosion or a fire. The steering gear shall be so grouped that the driver can manipulate the same while watching his route. There shall be nothing in front of the driver to obstruct his view, and the indicating apparatus shall be placed where he can easily see it. The vehicle shall be so arranged as to respond readily to the steering gear and to take sharp curves easily. Every part of the steering gear shall be solidly and safely constructed. Automobiles whose dead weight shall exceed 500 pounds shall be furnished with machinery for backward motion.

They shall be provided with a good and sufficient brake, which brake, or a separate or special arrengement, shall make it possible to check any forward or backward motion, and suitable bell, horn or other audible signal, which shall be rung or blown by the operator only to warn other vehicles and travellers upon the highways of his approach or whenever there is danger of collision or accident. They shall also be provided with all other appliances and apparatus, such as sufficient condensers to prevent the unnecessary escape of steam or vapor, and improved muffiers, etc., to stop any unnecessary noise in the operation or management of said vehicle upon the highways.

Improvements in the Spaulding.

The 1902 Spaulding runabout, manufactured by the Spaulding Automobile and Motor Co., of Buffalo, N. Y., is here shown for the first time. In common with the general tendency, it has longer wheel base, more powerful motor and has also a new style of body that gives it a very substantial, attractive appearance.

It is not expected that many will be seen in this country, the bulk of them going abroad, the company having taken a contract that will absorb nearly, if not quite, all of this type they are able to produce.

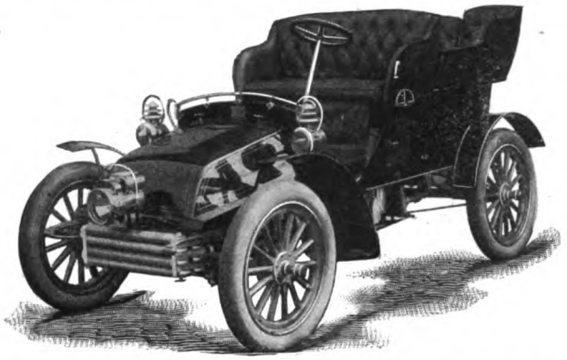
They will, however, show a new 25 h. p. tonneau touring car at the show that, rumor has it, is likely to be somewhat of a revelation in construction and price. The company are on the eve of important changes, due to the accession of new capital and men, all of which will be anounced in due time.

Where the Credit is Due.

Through a slip of the memory it was made to appear in the Motor World last week that the Electric Vehicle Co. had but recently begun to produce wheel steering electric broughams. As a matter of fact, this concern was by many months the first one to produce such a vehicle, having turned one out as long ago as January, 1902.

ALAS! SAYS LETTS OF LONDON

He Sells American Cars, but Doncher Know, he Avers, They Have no Chance for the Cup.



A story calculated to fill the hearts of American makers with awe is brought here about the wonderful prowess of the Napier machines that will compete for the cup. W. M. Letts, the Locomobile man of London, is the courier. He said: "So you folks over here think you will go over and lift the cup?" Then he smiled as if the idea was intensely amusing, and continued: "My, but you have no chance. The new Napiers that are being turned out are wonders, simply marvels. Well, when I tell you they have a machine now good for eighty miles an hour, steady going, you can guess that it will be hard to beat. And Edge always has something up his sleeve, too."

In the course of further talk Mr. Letts, with the unqualified confidence of a loyal Englishman, expressed confidence that the Napier machine would again win the cup against all comers. He does not think that the new course in Ireland now being considered will do, although it is ninety-four miles long, but expects to see the race held in France, and he commented that the Americans would have less chance there than they would if the race was run in Great Britain. One reason given by Mr. Letts for his confidence that a Napier will win is that S. F. Edge will drive one of the two entered and Jarrott the other, and Jarrott, says Mr. Letts, is the greatest automobile operator on the face of the earth to-day.

The house committee of the Automobile Club of America has made arrangements to keep "open house" to-day, New Year's, and refreshments will be served to members and their friends.

Commentary

Talk about hitting the nail on the head! Why, judging from the indorsements I have received of my last week's protest against the Mismanaged Mutual Admiration Association, that kick of mine must have banged a kegful of nails and landed on the head of each particular plank fastener therein. Most of my correspondents seem to think I did not make my protest sufficiently strong, and they forthwith proceeded to supply me with ample proofs of more foolish actions on the part of the N. A. A. M. that even I had never known of. I cannot, however, allow myself to be made the medium of publicity for the many grievances which my correspondence shows me exists against the existing mismanagement of the National Association of Automobile Manufacturers. As I said last week in this matter, I hold no brief for any one, nor will I. The injury this alleged representation of successful automobile manufacturers has caused the trade and the pastime is so manifest to any one who will for a moment look into the matter that it would be a sheer waste of time and space to make use of any of the proofs thereof which my indorsers have so kindly and so plentifully placed at my disposal. The disease has been diagnosed, the remedy for it is known and close at hand. Those who believe that the automobile trade is worthy of a representative organization, officered by men who have succeeded, not failed, in the automobile trade, have it in their power to secure such an organization and such officers whenever they will take the small amount of trouble necessary to relegate the present incompetents to the back door of prominence and the front door of a well earned and unregretted obscurity, from which unfortunate circumstances have temporarily detained them.

* * *

The way of the speed transgressor may be hard, but that of his victim is generally a little worse.

* * *

I went to a dinner recently which was given in honor of the New York-Boston reliability run, wherein first honors were based on "no stop" performances. Such is the perversity of man, however, that the memento presented to the guest of honor at the dinner, who had charge of the no stop affair, was a stop watch. This apparently incongruous gift had been chosen for the very good and sufficient reason that the official previously to the presentation had no stop watch.

* * *

It is a mighty poor rule in regard to an automobile that doesn't work at least four or five ways.

* * *

While at the banquet above referred to I was astonished to hear a prominent member of the Automobile Club of America address the diners in an impassioned appeal to organize themselves into a vigilance committee for the purpose of dealing out summary punishment to the owners of the light American type of motor vehicle. According to the speaker, who is the owner of one of the biggest and reddest foreign vehicles, and who, as he told the diners, has several times been arrested for speeding at a rate which he admitted was dangerous to the public, the latter really finds no fault with being run over or scared by an automobile, so long as it be a big imported automobile. When, however, the runner over or scarer is seated in nothing but an ordinary American made vehicle, then the public feels insulted and raises ructions. I tried to follow the gentleman's arguments in favor of his advocated lynchings of all owners of light vehicles, but I suppose my mental calibre was too small to grasp the logic of the speaker's ideas, if he had any, since it seemed to me like his plea was nothing but a very silly attempt to claim that only the owners of big and expensive automobiles had any legal or moral right upon the highways. I had previously heard that among other foreign ideas some of the members of the Automobile Club of America had sought to transplant here was the one that the automobile was something which was only for the rich, and for whose exclusive use it should by all means be kept; yet I must confess before this speech I had never heard any one unwise enough to publicly declare in favor of the idea. It takes all kinds to make a world, and I suppose because it does that this speaker has some excuse for being here, even though it is difficult to discover just what his excuse is.

* * *

As a rule, the owner of an automobile who possesses the largest stock of hard luck stories is the man who possesses the least practical knowledge of the vehicle itself.

* * *

All men are equal before the law! Of course they are, and if you have any doubts as to there being so I'll proceed to prove it to you. Two ladies entered a public conveyance and told the driver thereof to take them to a neighboring theatre. The driver—and he was licensed too, please note you who are preaching licensing as a sovereign remedy for automobile scorching—whipped up the poor beast from whose torture he lived, and at the risk of the lives of his passengers, and of every other user of the public thoroughfares, he tore through the streets and finally landed at the theatre. The ladies, almost frantic with fear, sought as quickly as possible to escape from the vehicle, whereupon the driver, licensed, please note, seized one of them by the throat, flung her upon the pavement and proceeded to amuse himself by kicking her. Along about this time a policeman strolled up and arrested the licensed driver. Next morning the gentle beast told the judge before whom he was brought that he was so drunk when he attacked his fares that he really did not know what he was doing. Whereupon the judge pityingly fined him $5! And took away his license, of course? Oh, no indeed; you see, he was a cab driver. Now, had he been a sober, respectable automobilist proceeding along an unfrequented street endangering no one, he would have been fined $50, perhaps imprisoned, and certainly deprived of his license, if he had one. Equal before the law are all men, eh? In story books may be, but elsewhere they are not.

* * *

Don't do any worrying about break downs in advance. The future never becomes really serious until it is transformed into the present.

* * *

There is a gentleman employed as a cartoonist on one of the yellow papers who when he is not cartooning dons a yellow road coat and races a trotting horse over the $5,000,000 Speedway which a generous city has provided for him and his kind. In Sunday's paper this cartooner has a scratchy drawing which I presume is a cartoon. It is entitled, "Which road will you take?" To the left of the picture is a stony hill labelled "Success." Up this hill three human things are walking. To the right of the picture is a broad, smooth road, leading downward into darkness, and this is called "Failure." Over the smooth road two equestrians, one bicyclist and three automobilists are proceeding, but not a single road wagon or any other form of horsedrawn vehicle is shown. Wonder why? Can it be possible that we can only go to failure on horseback, on a bicycle or in an automobile? Certainly that seems to be this "famous" cartoonist's idea, and yet the man who pays him what every one else thinks is a ridiculous price for his scratchy picture allegements uses an automobile upon every possible occasion. Evidently this is a case where like master is not like man.

* * *

In his annual report the Secretary of the Navy has this to say of the conclusions the navy experts have reached after extended experiments regarding the employment of oil as fuel:

"That the best results are obtained by atomization of the liquid fuel; that the oil before being fed to the burners should be heated; that the air requisite for combustion should also be heated before entering the furnace, in order to assist the gasification of the oil product; that either air or steam may be used for atomizing purposes, but that thermal efficiency is not increased by the use of steam; that the efficiency of an oil fuel plant is more dependent upon the general character of the installation of the auxiliaries and fittings than upon the form of the burner."

It is as sure as anything in the future can be that the automobile of to-morrow is going to look to the cheapest form of oil for the generation of its propulsive power, and such experiments as the ones the United States government is making in the navy will be the means of most quickly bringing about this much to be desired condition of affairs.

THE COMMENTATOR.

Driving on Rutted Roads.

After a hard frost it is well to drive very carefully if the road is at all rutty. Especially is this the case with small tires, for a sudden twist in a rut may pull them off entirely. Big tires fare better, for they will override even the deep ruts, but the frozen edges of the ruts will frequently cut the tires and render them temporarily useless.

The Hotel Gregorian

A New Fire-proof Hotel upon

35th STREET, bet. 5th and 6th Aves.,

Alterations in the Exchange.

Another change has come over the spirit of affairs at the Automobile Exchange and Storage Company, at 133 West Thirty-eighth street, and this time it is one that seems to promise prosperity. The present officers of the company newly elected are: John H. Robinson, President and Manager; Rodney K. Haines, Secretary; Robert Sproul, Treasurer. Manager Robinson has some enterprising ideas, and has under way a number of alterations that will result in decided improvements. The second floor is being extended so as to cover the hatchway space next to the west door, and a stairway has been built from the main floor up to the front part of the upper story, where there will be a show room for light vehicles, while the rear will be partitioned off for a shop. A waiting room for women and one for men are being installed and the office room curtailed. President Robinson says he expects to take on the agency for several lines of American cars, and also two or three lines of foreign make. The concern has engaged M. Jarridge to look after the business in imported cars.

To Organize in New Orleans.

Autoists of New Orleans, La., have called a meeting for the purpose of organizing a club. There are about thirty cars in the city. The objects of the proposed club are thus set forth in the call:

"To furnish a means of recording the experience of members and others using motor vehicles or automobiles; to promote original investigation in the mechanical development of motor carriages by members and others; to arrange for pleasure runs and to encourage road contests of all kinds among owners of automobiles; to co-operate in securing rational legislation and rules governing and regulating the use of automobiles in city and country; to maintain the rights and privileges of all forms of self-propelled pleasure vehicles whenever and wherever such rights and privileges are menaced; to encourage the construction of good roads and the improvement of the public highways, and generally to maintain a social club devoted to the sport of automobilism and protection."

Winton Will Protest.

It is understood that Alex. Winton is very positive in the opinion that the Race Committee of the Automobile Club should not select any individual with a car that is his first product to go abroad as a competitor for the Bennett cup. So earnest is he in the matter that Mr. Winton proposes to ask permission to appear before the Race Committee and present an argument to show that only established manufacturers should be recognized by the committee in making its selection of entrants, in case the committee makes its choice without trial races, as it is now deemed likely that it may.

The stand taken by Mr. Winton is right in line with the argument presented editorially in the Motor World last week.

Recent Incorporations.

Camden, N. J.—The Reserve Automobile Co., with $50,000 capital; to manufacture all kinds of automobiles. Corporators—Henry J. Kingsbury, John A. MacPeak and James F. Cotter.

New York, N. Y.—Westchester Automobile Co., with $15,000 capital. Directors—Sanford Robinson and L. E. Holden, of New York City, and Thomas Holden, jr., of White Plains.

Newark, N. J.—The Motor Car Co. of New Jersey, with $50,000 capital. Corporators—Inglis M. Uppercu, Richard T. Newton and C. V. Childs.

Exports Still Expanding.

The exportation of American automobiles continues to show gradual and encouraging expansion. The returns for November disclose shipments to the value of $55,473, as against $39,383 in November of last year. For the eleven months ending with November the exports were valued at $1,026,083, as compared with but $301,920 during the corresponding period of 1901:

TRIALS OF THE TESTER

The Ignominy to Which he is Subjected by his Unsympathetic Townsmen.

"That a 'prophet is never without honor save in his own country,' is often true of an automobile maker, that is if you substitute town for country." remarked a man who should know to the Motor World representative. "At least that has been my experience.

"When we first began to turn out completed cars the testing department was, of course, called upon to pronounce them right—or, as it frequently happened, wrong—before they were shipped.

"FAR FROM THE CITY'S BUSY STREETS."

"Now, there was but one way of giving them a real test, and that was to send them out on the streets and run them. Then we could see what would happen. And, it must be admitted, we did see, oftener than was at all pleasant. Looking back at it now, it was only natural; for how could any one expect a complicated piece of machinery like an automobile to emerge perfect from the factory—like Venus from the foam flecked sea. At any rate our cars did not.

"They went wrong—persistantly, and, as it seemed to us, maliciously. And they seemed to take delight in going wrong in the most public manner possible. The most frequented places—where a huge crowd could gather in the space of a second or so and make unkind and facetious remarks, such as 'there's another—busted,' suited them best it seemed.

"When this happened the man in charge had the choice of locating the trouble then and there, or of telephoning to the factory for help. Whichever he tried he came to the conclusion that his choice was the worse of the two evils. If he worked on the car the crowd increased until it seemed as if there was a fire or a riot, and the police would politely inquire if they hadn't better ring up an ambulance, while the front row of spectators would offer suggestions gratis. If another car was sent from the factory to haul the ailing one home the agony was less drawn out, but the ignominy was, if possible, intensified.

"That is, unless the second car should develop a perverse tendency also. That did not happen often, but it did once or twice, and you can readily conceive my poignant anguish when the crowd offered to haul the two vehicles to the shop.

"But there was no help for it. We had to test the cars before sending them away, and there was no other place, except the country roads outside the town, and these, in the early stages of manufacture, were sometimes difficult to reach, so chronic were the balky habits of the cars.

"The men who tried them used to come to me and complain of the hardships they underwent. They had their lives almost 'joshed' out of them by would be facetious onlookers. The now familiar 'git a horse' had not come to the front then, but its equivalent were numerous—'ice wagon' being the most popular. Indeed, it became a synonym for our car in some quarters, the harassed testers told me.

"'Never you mind; you go ahead and attend to business without paying attention to them,' I would say. 'The work has got to be done, and the best way is to do it with as little fuss as possible. The time will come when you won't have all this trouble.'

"This prediction proved true, for it is a long lane that has no turning. But it seemed an eternity before we reached the end. By that time the car was utterly, and as it seemed irrevocably, damned in the place of its birth. Everybody knew of its trials and tribulations, and the only way it could have been made to go in that town would have been by donating it with our compliments; and I am not sure that even then there would not have been some declinations.

"Thus it happened that long after the car had a good reputation elsewhere and sold readily wherever we tried to push it, the home market was closed tightly against it. Recognizing the fact, we made no effort to push it there. We went on building and shipping away, testing as usual in the town, but with much better results.

"As these testing cars were seen running, instead of broken down as of old, and the workmen kept telling of the popularity of the car in other localities—as evidenced by repeat orders—public opinion began to veer around. People said that maybe our cars had some good points after all, and after awhile we got to the point where we could sell one here and there.

"But it was an up hill job, and even yet we have to work much harder to make a sale here than to some one outside the town."

The Springing of Cars.

The proper springing of cars is a matter of no small importance. When light, very easily sprung cars are driven with but one or two passengers on the front seat, the plunging of the car over rough roads will be found to affect the gasolene feed to the float chamber of the carburetter. The plunging will cause the float to lift and flood or drip, and shut off the feed, or vice versa, so that for a few moments the engine is starved of gas. This involuntary cutting out of the engine, when gasolene is fed by gravity, may be largely prevented by keeping the tank filled.

Lengthening the Battery's Life.

When the electrolyte or liquid in an accumulator cell falls below the level of the plates by reason of evaporation it should be filled up with a little clean, soft water, distilled if possible. Further additions of sulphuric acid are not required. The solution should never be allowed to get beyond a quarter of an inch below the top of the plates, as it may cause them to buckle. If for any purpose the acid solution is emptied from the cells they should be filled up with water to prevent the plates sulphating.

There is a probability of the Panhard people introducing a "mixed" car for 1903; that is, one driven by both gasolene and electricity on the style of the Lohner Porsche Austrian cars.

The Week's Patents.

716,382. Steam Engine. William S. Colwell, Chicago, Ill. Filed October 29, 1901. Serial No. 80,403. (No model.)

Claim—1. The combination with a direct acting engine having a reciprocating piston, and a piston cylinder provided with valved ports for supply and exhaust; of a vacuum chamber; an attachment to the piston cylinder comprising a shell or casing having a port connected with the main exhaust port of the piston cylinder and branched to form a couple of ports which are connected with the vacuum chamber, and an intermediate port arranged for discharge into the atmosphere; a rotary three way valve arranged for alternately opening and closing the branaches of the port which connects with the main exhaust passage, and operating during each stroke of the piston to first direct the exhaust from the main exhaust passage into the atmosphere and to then cut off such exhaust and place the main exhaust passage in open communication with the vacuum chamber; and a valve actuating device applied for operating said rotary valve and comprising a crank connected with the valve, a reciprocating rod for actuating the crank, and connection arranged between the reciprocating rod and the eccentric strap of the engine and involving a vibratory lever.

716,388. Steering Mechanism for Motor Vehicles. Charles Crompton, Worcester, Mass. Original application filed September 25, 1901. Serial No. 76,548. Divided and this application filed January 29, 1902. Serial No. 91,659. (No model.)

Claim—1. In a motor vehicle, a steering shaft, steering wheels a connection extending directly from said shaft to the steering wheels, a second connection between the shaft and steering wheels, said second connection including gearing, and means to render either of said connections operative.

716,492. Engine or Motor Louis Sterne. London, England. Filed April 11, 1902. Serial No. 102,446. (No model.)

Claim—1. In an engine of the type described, the combination with the pistols of rollers and operative cam united by a guiding construction for holding the two devices in the same vertical plane, substantially as described.

716,497. Hydrocarbon Burned. Hugh L. Warner and William H. Lonsdale, Dayton, Ohio, assignors to the Dayton Motor Vehicle Co., Dayton, Ohio, a corporation of West Virginia. Filed July 25, 1901. Serial No. 69,679. (No model.)

Claim—1. In a hydrocarbon burner, a burner the base of which has a series of tubes projected therefrom, and the top plate of which has a corresponding series of openings into which said tubes project, and a washer of less diameter than said openings mounted on the upper end of each of said tubes within the openings in said top plate, whereby there is provided a series of annular gas jets surrounding said washers, substantially as specified.

716,523. Multiple Expasion Steam Engine. Jackson Deneal, Toledo, Ohio, assignor of two-fifths to Stephen Brophy, Toledo, Ohio. Filed March 9, 1901. Serial No. 50,503. (No model.)

Claim—1. In a double acting multiple expansion engine, the combination of a series of cylinders of progressively increased diameters respectively, connected together side by side in the order of their progression, with their axes in the same plane, comprising a valve cylinder, a high pressure cylinder, and one or more expansion cylinders, a pair of ports in each of the division walls between the cylinders, leading from centrally located openings in the smaller cylinder, in opposite directions, to openings in the larger cylinder, adjacent to its heads, that are exhaust ports for the smaller cylinder and inlet ports for the larger- exhaust ports in the low pressure cylinder, located centrally of its length and opening into an exhaust, a steam connection for the valve cylinder, provided with a pair of branch connections opening into opposite ends of the valve cylinder, a piston in each cylinder, adapted as a valve to close the exhaust ports of its cylinder in the middle of its stroke, and open them alternately at the end of each stroke, the pistons being connected with cranks of a common shaft, the crank for the piston of the valve vylinder being set at 90 degrees from the centres of the other cranks, which alternate at 180 degrees from each other, and a manual valve in the steam connection, adapted to progressively open or close either or both the branch connections to the valve cylinder separately or simultaneously, substantially as shown and described.

716,573. Carburetter for Explosive Engines. Carl N. Nelk, Palo Alto, Cal. Filed September 4, 1902. Serial No. 122,084. (No model.)

Claim—1. A device for vaporizing liquids comprising a casing having a closed top, a conical diapragm located between the top and bottom, means for delivering the liquid upon the apex of the diaphragm to allow it to flow downwardly and outwardly, a chamber located between the top of the diaphragm and the interior of the casing, and a discharge passage therefrom, a series of open ended tubes connecting the chamber with the space below the diaphragm, and having openings coincident with the base of the diaphragm through which oil may enter the tubes.

716,590. Joint Closer for Rubber Tire Setting Machines. Will C. State, Akron, Ohio, assignor to the Goodyear Tire & Rubber Co., Akron, Ohio. Filed May 8, 1902. Serial No. 106,413. (No model.)

Claim—1. An improved clamp for rubber tire setting machines consisting of two oppositely disposed hinged jaws having in their inner faces grooves arranged diagonally with reference to the line of the tire, substantially as shown and described.

716,610. Motor Vehicle. William O. Worth, Chicago, Ill., assignor of two-thirds to William R. Donaldson, Louisville, Ky., and Henry W. Kellogg, Battle Creek, Mich. Filed June 16, 1899. Serial No. 720,837. (No model.)

Claim—1. In a motor vehicle, the combination of a motor shaft, a pair of bevel pinions mounted thereon; a secondary shaft, a pair of bevel gears mounted on said secondary shaft both meshing with one of said pinions, and a smaller gear on saeid secondary shaft meshing with the other of said pinions; with clutch mecnanism substantially as described, whereby power is transmitted from the motor shaft to the secondard shaft through either of the large gears and the pinion meshing therewith, or through the smaller gear and pinion meshing therewith, for the purpose and substantially as described.

716,615. Explosive Engine. Benjamin F. Bain, New Brighton, Pa. Filed September 28, 1899. Serial No. 731,969. (No model.)

Claim—1. In combination with an explosive engine, a puppet valve controlling cylinder port, and slide valve controlling communication between exhaust and fuel ports and said cylinder port, and connections for positively retaining said puppet valve open during the exhaust period and the suction or recharging period, and successively opening the exhaust and fuel ports, substantially as and for the purposes set forth.

716,593. Pneumatic Tube for Tires. Chas. E. A. Erse, Ormskirk, England, assignor of one-half to James Hamilton Cobley, London, England. Filed May 16, 1902. Serial No. 107,670. (No model.)

Claim—1. An inner tube for pneumatic tires, characterized by a long length with closed ends overlapping each other, the valve being placed near one end, and the other end formed with an elastic sleeve solutioned all around the tube at one part, so as to leave the extreme end free all around inside the sleev to form a pocket for the reception of the opposite end of tube, and yet permit the outer sleeve to be drawn back so as to expose the end of the tube which was previously inside the sleeve to enable any repairs to be effected.

716,656. Electric Battery Compound. George Bastedo, Brooklyn, N. Y. Filed March 28, 1902. Serial No. 100,472. (No specimens.)

Claim—The herein described composition of matter consisting of dilute sulphuric acid fifteen pounds, nitric acid fifty drams and bisulphate of mercury one ounce, substantially as described and for the purpose set forth.

716,664. Distributing Device for Steam or Air Engines. Charles A. Brunner, Levallois Perret, France. Filed July 13, 1901. Serial No. 68,272. (No model.)

Claim—1. A steam engine having a cylinder, a reciprocating piston, a valve chamber, a valve mechanism comprising the combination of a rotary valve, co-operating parts between the valve and cylinder and a spindle for the valve, a sector head on the spindle, a frame journalled on said spindle, a weight on the frame, and a projection on the reciprocating piston to act on the frame, substantially as described.

Where he got his Accent.

"Hello, Mulcahey! Well, well! How are you?"

"Clever, old chap; quite clever. I'm jolly well glad to see you, too. And how have you been?"

"Say, Tim, chop it! Where in blazes have you been; over in London for a year? Where did you get that accent, eh?"

"No, I haven't been away, you know. Have I an accent, really?"

"Oh, drop it, Tim. What are you doing?"

"I am demonstrator in an automobile establishment."

"O-o-o! I understand."

Their Ideas of Speed.

There's more truth than fiction in this summarization by the Smart Set of automobile speeds as viewed by interested persons:

WHERE'S THIS WONDER?

Specifications of a Mysterious American Cup Candidate That Come Via London.

'Round Robin Hood's barn—that is, by way of London, comes an account of an anonymous racing car that is being built on this side to take part in the Gordon Bennett Cup race. Premising its story with the remark that "the promises made in the name of this prodigy are entitled to respect on account of the standing of its sponsors" Motoring Illustrated goes on to say:

"The project of the constructor is to build a vehicle which shall, by a mere alteration of gear ratio, serve equally well for a 'terrific racer' or for a comfortable, high class touring car. Up to the present, he considers, cars have been built to possess a certain time or mileage, having accomplished which they require to 'go into shop' for repairs. 'The car we are building, and those to be patterned after it,' he says, 'should run 25,-

000 miles withotu needing more than ordinary attention. The following are some of its chief features.

" 'The motor is composed of 103 pieces, far fewer than found in other four cylinder petrol motors used in automobiles.

" 'Intake as well as exhaust valves are opened and closed by positive mechanical action.

" 'The composition of the explosive is invariable; the compression variable. With sharp throttling the mixture at the end of the compression stroke indicates little above atmospheric tension.

" 'The petrol and air feed mechanism is on distinctly new lines, but resembles that of the Mercedes Simplex engine somewhat.

" 'The drive on the high speed gear is direct by longitudinal bevel gear shaft to bevel gear on live axle with differential gear. The shaft and bevel gears are after the Renault type.

" 'The rear axle is trussed, but is relieved of all bending stresses by supporting its quota of the weight of the vehicle practically in the planes of the wheels.

" 'The front wheels are internally pivoted, but the construction differs from that used in European cars embodying this feature.

" 'All severe stresses arising from rough and speedy travelling have been localized with extreme care.

" 'Wide bearings, large wearing surfaces, broad faced gears are the rule throughout.

" 'Experiments show a fuel economy at the lowest throttling equal to that registered at full speed and power. The motor is of 50 indicated horsepower, but is capable of developing 75.

" 'Throttled low, each of the four cylinders give less than one to two horsepower, showing the enormous range obtainable by perfect throttling.' "

The Rambler of 1903.

In the 1903 model of the Rambler touring car, Model E, is presented a vehicle in which are embodied all the excellencies by which this make has commanded ready sale in the past, together with a few improvements of interesting character. To begin with, an addition of two horsepower has been gained by increasing the dimensions of the cylinder one inch each in bore and stroke. The next most important change is the adoption of artillery wheels instead of wire wheels, but the new ones have the Rambler stamp in the width of the bearings. The hubs are of steel, and have more space between the ball cups than other wheels of similar size. The wheel base has been lengthened six inches the the body brought two inches lower. The differential has been radically changed; the whole case and sprocket is now made in one piece, and an end thrust bearing provided for the rear axle so as to avoid end play. A new carburetter with float feed has been introduced, of which great things are expected. The cooling system has been enlarged so that there are now nearly 400 radiating tubes instead of 200. The axles are heavier, and the front one has been reinforced throughout its entire length. There is a solid panel seat back to the new car, and complete mud guards are furnished as a regular equipment without extra charge. While the body is of the same general type, the lines have been softened and the rather blunt appearance of the front bonnet has been overcome. The tires used will be three inches in diameter instead of two and one-half inches, as were used last year, and the gasolene tank has been enlarged so that it now has a capacity for 150 miles.

Three hundred of the 1903 Rambler cars have been contracted for by John Wanamaker, who has taken the New York agency, and R. A. Greene, who has charge of the automobile department, expresses serene confidence that they will all be sold.

ON RURAL ROUTES

Results of a Month's Test Demonstrate Motor Car's Advantages for Mail Delivery.

After a series of exhaustive tests over a number of rural mail delivery routes in Lenawee County, Mich., the automobile is pronounced a success by the postmaster having charge of the tests, and he is likely to send a strong recommendation to Washington concerning them.

The tests, which lasted for a month, were made in all kinds of weather, and were wonderfully successful, failing only once, when heavy snowdrifts over icy roads were encountered.

One of these routes is twenty-nine miles long, contains 140 boxes and accommodates 700 people. On this route the start is made at 10 o'clock in the morning, and the return to the postoffice is made at a little after 1. By using automobiles the carrier can leave the postoffice much later than with his wagon, and is thus enabled to deliver much mail received on the later morning trains that would otherwise not be carried until the next day. In addition to this the routes are covered in fully half the time required by the wagon.

These are two strong points in favor of the auto, yet there is still one other which has been brought out, and that is the improvement of the roads which would follow the installation of an automobile system. With the excuse as a lever, that the rural route will have to be discontinued over any certain portion of road because of its poor condition, a community would go to a great deal of expense rather than have the threat carried out.

An example of this can be cited. On route No. 4 was a piece of road that was almost impassable. Mr. Priddy went to one of the leading farmers on the route and pointed out that unless it was remedied they could not expect to receive his mail by the auto. Although the section referred to was quite a distance from his home, Mr. Priddy's companion replied at once, "If those people will not fix their roads I and some of my neighbors will." And they did.

The following report of Postmaster Priddy gives a good idea of the work performed:

December 18, Route No. 3, Carrier E. H. Hendereson; length, 29 miles; number of stops, 125; number of pieces delivered, 409; pickup, 59 pieces; weather, clear; condition of roads, partially frozen and very muddy; amount of gasolene consumed, two and one-half gallons; time for delivery, three hours and fifty-six minutes.

The Clemick-Hirsch Co., Milwaukee, Wis., makers of gasolene motors for launches, has entered the automobile field, and expects to have its first car ready by February.

Franklin's Coal Scuttle.

Both seasonable and suggestive is the little Christmas remembrance which C. A. Benjamin, of the H. H. Franklin Manufacturing Company, sent to a number of his friends last week.

It was a match safe made in the form of a coal scuttle, and with it went a letter, part of which follows: "Under separate cover we are mailing you a reminder of a recent great disturbance, the outcome of which has been the cause of enough inconvenience and annoyance to make a man swear like a pirate. We trust you are not in this class. We sincerely hope your coal bin is full to the limit and your cup of joy is working overtime. When you look at this little match safe, keep in mind that no motor car of its class matches the Frankling, and we hope things will be red hot with you from now on."

How the De Dion was Tested.

In order to test the new "Popular" De Dion car, the well-known French concern recently sent it round Europe on a course whwich included Geneva, Turin, Florence, Bologna, Venice, iVenna, Prague, Dresden, Berlin, Hanover, Amsterdam and Brussels, making 3,100 miles in all. The car had to traverse the Juras and the Alps, and also to climb the famous Semmering mountain near Vienna. It also had to travel along the notorious Austrian roads, with their deep ruts running crosswise and dos d'anes, and had to negotiate the equally famous granite setts of Belgium.

Using the Compression as a Brake.

If the compression of the engine, with a slow speed in, is being used as a brake, take care not to switch the spark on again suddenly, as great strain will be put upon the engine and gear. Crankshafts have been broken in this way.

Vague Ideas of Chains.

"Some otherwise well informed autoists seem to have the very vaguest ideas about chains," remarked a tradesman the other day in conversation with the Motor World man.

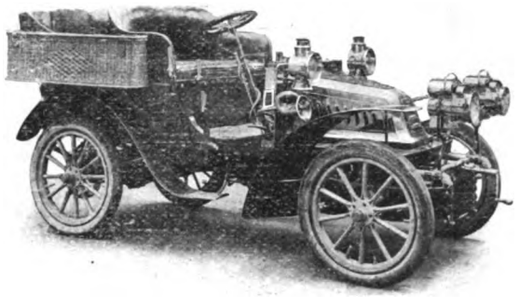
"There are men who come in here and ask for complete chains or parts, and a little talk develops the fact that 'pitch' is Greek or Sanscrit to them. Even width is a sealed book, as far as knowing how to measure a chain is concerned. So many chains are alike that we make out pretty well, but frequently we are quite unable to divine what is wanted.

"We try to impress on users of cars that the pitch is the distance between link centres, not, as some think, the length of the open space into which the teeth of the sprocket teeth fit. A one inch pitch chain is just as many inches long as it has links.

"Chain widths, on the other hand, are the measure of the space or clearance between the side links, not the distance outside of links. With a car using a chain ½ inch in width, for example, the teeth of the sprocket wheel will be a scant ½ inch wide—just enough scant usually to allow clearance so the chain won't bind as it passes over the teeth.

"If people would only bear these facts in mind when ordering chains we should get rid of a lot of trouble, and they would be better served."

It is an excellent idea, especially during the winter, to protect the lower part of the engines. It is surprising how much work a leather or similar material cover slung from the sides of the frame and carried beneath the engine flywheel and gear box will save. Though such an arrangement is not a thing of beauty, it is extremely useful, if not absolutely necessary.



How They Tricked Miller.

"Had a cute trick played on me last week," remarked Chas. E. Miller, the well known jobber, pulling a reluctant smile.

"A man came in and got a pair of lamps 'on approval.' He paid cash for them—list price—and was to return them if they did not suit. A day or two later he brought them back, and we paid him his money without hesitation.

"Then by a mere accident we learned what was back of the occurrence. The lamps had been procured for a competitive lamp concern—a big one, too—taken to a photographer and 'snaps' made of them complete and in parts and examined minutely. This was bad enough. But it was adding insult to injury to return them and get their money back.

"I guess I am too honest to cope with people like this," concluded Miller with great soberness.

THE HAYNES-APPERSON

is the only automobile that has been consistently developed through 10 years of successful experience on American roads.

The same development that has given foreign cars their reputation has given the Haynes-Apperson its proved reliability, but because of the more severe conditions under which it has been produced there is no car of equal horse power that will last as long, handle as easily and ride as smoothly on American highways as this American product.

Runabout, 7 horse power, 2 passengers, $1200.
Phaeton, 12 " " 2 " 1500.
Surrey, 12 " " 4 " 1800.

CUP COMMITTEE MEETS

Orders All Candidates to be Ready April 11—Winton Enters no Protest.

In the action taken by the Race Committee of the Automobile Club of America last Monday, there was strong indication of a desire and an intent to hold preliminary trials for the international cup race candidates, if such a thing is at all possible. The meeting of the committee was held behind closed doors at the club, and it is known that there was a lengthy discussion of plans for a trial contest, and that various forms of tests were considered. What these were would not be revealed by any of the committee, the full quota of which was present. The committee comprises G. Isham Scott, chairman; Dave H. Morris, Harlan W. Whipple and A. R. Shattuck.

The official announcement made by the committee after the meeting was that all candidates for the race team must have their cars in New York City ready for whatever call upon them the committee may choose to make, by Saturday, April 11. Although this announcement was prefaced by the explanation that the move was a precautionary one, due to the fact that under the rules the race may be held as early as May 15, it was generally understood that there is no likelihood of the race being held before June or July, and that the order was issued because the committee had positively decided to hold trial races. It was further announced that no nominations would be received after February 1.

Messrs. Percy Owen and H. S. Harkness both were present at the meeting and went before the committee by invitation. The nature of their communications was said to be confidential, but from what could be gleaned it had to do with suggestions for the contest, and in no way related to a protest against the selection of cars not made by established manufacturers. The fact that a protest was not made by Alex. Winton or his representative, is a further indication that the selection of the competitors will depend upon a practical test, in which case Mr. Winton has no objection to competition against individual builders.

An announcement was made by the committee that a second machine has been entered by C. W. Matheson, of Grand Rapids, which makes six candidate cars in all, one of which, that of Alex. Winton, has been formally accepted. The other five from which the committee has to select two, are the two Matheson cars, and those of H. S. Harkness, L. P. Mooers and Percy Owen.

Dame Rumor still has it that a White steamer is apt to be a candidate before February 1.

Blood from Kalamazoo at $400.

Organized with ample capital, a strong board of directors, and having a $400 gasolene automobile almost ready to be placed on the market, the newly incorporated Michigan Automobile Co., Ltd., Kalamazoo, Mich., will undoubtedly prove a factor in the trade.

The concern will make the Blood automobile, the invention of M. E. and C. C. Blood, of the Kalamazoo Cycle Co. The vehicle has been tested in an exhaustive manner, and although the lightest as well as the cheapest, on the market, weighing only 400 pounds, is a thoroughly practical and reliable car. It will be of first class construction, its simplicity accounting for its extreme cheapness.

Property, with buildings and four acres of ground, has been purchased, and work will be started at once. It is expected that deliveries will be made by April 1.

At a meeting of the Board of Directors the management of the company was placed in the hands of these active officers: Frank D. Fuller, secretary and business manager; M. E. Blood, treasurer and general superintendent. C. D. Fuller is chairman of the board.

Buffalo to Hold a Show

One more city has been added to the list of those that will hold local shows. W. C. Jaynes, of Buffalo, N. Y., announces that he will hold an automobile and sportsmen's show in Convention Hall during the second week in March.

GASMOBILE IS OUT

Reorganization Finally Fails — Pan-Am Buys Machinery and Increases Capital to $500,000.

By the purchase of the machinery and stock of the Automobile Co. of America the Pan-American Motor Car Co. becomes possessed of the principal remaining assets of that company, and the latter will positively not continue the manufacture of automobiles. Incidentally, the Pan-American company, in which A. C. Bostwick is largely interested, has been reorganized, its capital stock increased and plans are on foot looking to the removal to a new factory.

Such is briefly the result of the negotiations that have been pending for some little time between the two companies, and which have been the subject of a number of more or less misleading paragraphs in the newspapers during the last few days. There is no consolidation or combination. The Pan-American car will not be built at the Marion plant, nor will the Rochet-Schneider or any other cars be manufactured there. The latter will be closed, and, if possible, sold.

To a Motor World man on Monday George F. Chamberlin, who was applied to for an accurate statement regarding the matter, said:

"How the reports published got out is beyond me. But they are utterly wrong. Speaking solely as counsel for the Pan-American company, I will say that these are the facts:

"The capital of the Pan-American Motor Co. has been increased from $100,000 to $500,000. The company has just acquired by purchase the entire machinery and stock—the latter including both complete cars and parts—of the Automobile Co. of America, Marion, N. J. This machinery is of the highest type, and cost a large amount of money. It will be removed at once—the work has already begun either to our present factory at Mamaroneck or to a new one

MORE FRENCH FEATURES

How Some of the Most Famous Makers Have Improved Their Cars—New Steering Gear that Appears Sensational.

French Bureau Motor World.
2 Rue d'Abbeville.

Paris, Dec. 21.—Among the other cars at the show that bore evidence of no small refinement was the Rochet-Schneider. They displayed a four-cylinder, 16 h.p. petrol car, with vertical motor placed in front and with mechanically operated inlet valves. The inlet and exhaust valves are interchangeable and are situated on opposite sides of the cylinders. There are, therefore, two cam shafts. The valves can be removed or inspected by unscrewing a stirrup which holds down a round plug slightly larger in diameter than the valves and which, when removed, allows the valves to be easily withdrawn. On the exhaust side, these plugs contain the ignition arrangements, which can thus be instantly taken out and examined. The ignition is obtained by the rupture in the explosion chamber of the alternating current from a magneto which is driven from the cam shaft. In order to produce the rupture there is a vertical rod for eoch cylinder, which is rotated in one direction by a cam on the half-speed shaft and in the opposite direction by a steel wire spring, which is coiled round it. At the upper end of this rod there is a little hammer, which strikes a lever which is pivoted on a center in the plug above the exhaust valve. By the other end the lever is held in position by a spiral spring, which maintains a contact in the explosion chamber, between the sparking plug and a contact finger, which is mounted on the same shaft as the lever above mentioned. When the cam releases the vertical rod, after having rotated it, the spring brings it back quickly and causes the little hammer to strike on the lever, overcoming the pull of the spiral spring and breaking for an instant the contact in the explosion chamber, and thus causing a fat spark. The vertical rods are free to move vertically, and over the tops of the four rods there is a bar working on eccentric slots in such a manner that when the bar is pushed forward the rods are depressed and the cams attack them earlier and causes the rupture to take place sooner, thus advancing the ignition. Should there be a back explosion and the engine reverse, the cam pulls the vertical rods into such a position that they cannot strike the levers, and so no harm is done. The frame of the car is of armored wood, and this is the only direction in which the Mercedes practice has not been followed. The change of speed is accomplished by means of two sliding gears, or "train balladeur," worked by two rods which project from the end of the gear box and which carry at the end of each a stirrup. The change speed lever can pass between these two stirrups only when it is in the center position; that is to say, at the dead point. It has a side motion, so as to be able to engage with either of the stirrups, one of which works the reverse and first speed and the other of which works the second, third and fourth speeds. It is therefore possible to pass from the dead point direct to any speed without passing through the others. The transmission is by chains. The cooling of the cylinders is accomplished by means of a tank radiator of the Mercedes type, cooled with a fan placed just behild it, the water being kept in constant circulation by means of a pump.

A new steering gear is just being put on the market by Messrs. Malicit & Blin. The first model is exhibited at the show, and it promises to take the trade by storm and replace all other existing systems. All gears, racks, sectors, double nuts and screws are done away with in this motion, which consists in a cam movement. A V shaped cam fixed to the steering pillar works backwards and forwards the lever which moves the front wheels. It transmits its motion through two conical rollers mounted on the lever in question. When highest part of the V shaped cam is on top of the conical rollers the wheels of the car are straight, and it is quite impossible to turn them, except by the steering wheel. As the latter is turned in one direction or the other, the V shaped cam forces the conical rollers to the right or left, and thus turns the front wheels. There is a total absence of play or back lash, and the whole motion is extremely simple and is inclosed in an oil bath.

The Peugeot Company have definitely abandoned the horizontal motor placed in the rear of the car, and have replaced it by the vertical cylinder placed in front, and it is evident from the number of visitors which were constantly attracted to this stand that this change of tactics is thoroughly in favor with the customers. Indeed, the 12 h.p. and 18 h.p. chassis of 1903 made by the Peugeot Company follow very closely the Mercedes lines of 1902. True it is that Mr. Follow, the managing director, claims that instead of copying the mechanically operated inlet valves from Cannstadt, they were first in the field and had them in experimental cars in 1901. The 12 h.p. and 18 h.p. cars of the Peugeot Company have each four cylinders, four speeds and reverse, and stamped steel frames. Both electric and magneto ignition is employed, the former only having an arrangement to advance or retard the sparking. The change of speed gear is of the usual type, with one sliding sleeve carrying three gears; the fourth speed is direct, and is similar to the Mors and Georges Richard type, adopted last year for the Paris-Vienna race. The transmission is by chain, and there is a compensated brake on the hind wheels, which is appplied, drawing forward a bar placed across the car and pulled by its center; at each end of this bar the brake rod of one wheel is attacked, in such a manner that the rod takes a position which compensates the brakes and makes the friction on each one of them the same. The 12 h.p. motor gives about 15 on the brake, and the 18 h.p. motor gives about 22 h.p. The apparatus for making the rupture of the magneto current in the cylinder is exceedingly simple.

Mr. Leon Serpollet still retains his place at the head of the French manufacturers of steam cars, and exhibits a new model for 1903.

Like the productions of the manufacturers of petrol cars, the power of the Gardner-Serpollet increases year by year, whilst at the same time the weight decreases, strange to say, without the construction being any the less robust. Thus, whilst the 1902 model 12 h.p. car weighed 1,000 kilos, the 1903 40 h.p. car only weighs 920 kilos for the touring model and 100 kilos less for the racing model. The new features are two in number. In the first place, the pump which supplies water to the boiler as the steam is required is operated in quite a different manner. It will be remembered that in the old model a series of cams on a shaft driven by the engine gave the pump more or less lift, so that more or less water was forced into the boiler to increase or decrease the speed of the car, as the case might be. There were, therefore, three or four distinct steps in the feed, corresponding to the different cams. This system, which presents certain disadvantages, has been replaced by an eccentric link and a slide valve, which gives a more gradual and easier regulation to the feed water. The second improvement is in the lowering of the boiler and the reduction in the number of the elements, which at the same time retain the same heating surface as before. The lowering of the boiler of course lowers the center of gravity of the car, gives it a smarter appearance and makes it easier to mount the carriage work. On the Gardner-Serpollet stand there is also an omnibus, with a 20 h.p. motor, arranged to carry 14 passengers, at an average rate of speed of 16 miles per hour.

The Darracq car has been completely changed, and the 1903 pattern presents most of the features of the Mercedes car of 1902. The most interesting of the new models are the two-cylinder 12 h.p. and the four-cylinder 16 h.p., which both have frames stamped out of U steel, throttle carburators controlled by a lever placed in the steering wheel, mechanically operated inlet valves, and honeycomb radiators. It is claimed that these cars are very silent and easy running. Darracq & Co. have turned out over 1,000 cars during the year 1902, and have in hand a series of 1,200 cars for 1903.

GASOLENE MOBILE COMING

Manager Gallaher Admits Truth of Reports—Plans New System of Storage and Repair.

Without any blare of trumpets or banner bearing parade E. B. Gallaher, of the Mobile Co. of America, has moved the executive offices of the concern from Tarrytown to New York and established them on the second floor of the building at No. 1,709 Broadway, corner of Fifty-fourth st. After February 1 the possession of the big corner structure will be taken, but at present only the second floor is used.

The new gasolene model which it has been reported was to be an added Mobile product, Mr. Gallaher acknowledged, will soon be an accomplished fact. It will be a big car with a tonneau, but it will not be finished in time for the shows.

Mr. Gallaher has some ideas of his own concerning the extensive business that the firm proposes to do in the big building which is so especially adapted to automobile uses. He thinks that there is now too much uniformity in the prices charged for storing cars, and that this uniformity is the cause of much dissatisfaction on the part of patrons. For instance, a man who owns a runabout feels that it is not just that he should pay as much for storing it as does the man who owns a big touring car. An investigation by Mr. Gallaher has satisfied him that in many places there is a fixed price of so much a month for storage without any distinction being made between big machines and small ones. It is Mr. Gallaher's intention to remedy this, so far as the new Mobile station is concerned, by arranging a scale of prices, varied in proportion to the number of square feet that the cars occupy on the floor of the garage. Thirty dollars a month, for instance, will be about the ruling price for touring cars. Runabouts will be stored for about $20, and the cars of intermediate sizes will be scaled at about $25.
